This organization was supported by TUBITAK within the scope of "2223-B - Grant Program for Organizing Scientific Meeting within the Country

IV. INTERNATIONAL CONGRESS OF THE TURKISH JOURNAL OF AGRICULTURE - FOOD SCIENCE AND TECHNOLOGY (TURJAF_2025)
APRİL 28-30, 2025, NIGDE/TURKIYE

Oturum Session	Sunum Saati Presentation Time	Yazarlar Authors	Çalışma Adı Paper Name	Ülke Country
AÇILIŞ	09:00-10:00	Kayıt/Registration		
	10:00-11:20	Açılış Konuşmaları / Opening Seramony	Onuruna TURJAF 2025 Kongresi düzenlenen Prof.Dr. Musa SARICA'nın özgeçmişinin okunması	
		Prof.Dr. Ahmet ŞEKEROĞLU	TBTF Dekanı/Dean of FAST	Türkiye
		Prof.Dr. Hasan ELEROĞLU	Editor of TURSTEP	Türkiye
		Prof.Dr. Musa SARICA	Editor of TURJAF	Türkiye
		Dr Şerafettin Çakal	TAGEM Genel. Müdür Yrd. / Deputy Director General of TAGEM)	Türkiye
		Prof.Dr. Hasan USLU	NOHU Rektörü/Rector of NOHU	Türkiye
		Dr. Cahit ÇELİK	Niğde Valisi/Governor of Niğde (Teşrifleri durumunda)	Türkiye
	Kongre Açılış Sunumu/ Opening Presentation of the Congress	Prof.Dr. Musa SARICA	Türkiye'de etlik piliç ıslahı alanında yapılan son çalışmalar ve gelecek beklentileri / Recent studies and future expectations in broiler breeding in Turkey	Türkiye
	11:20-11:40	Mola /Break		

28 Nisan 2025 Pazartesi / 28 April 2025 Monday
Salon 1923 – Hall 1923
AÇILIŞ / OPENING

Oturum Session	Sunum Presentation	Sunum Saati Presentation Time	Yazarlar Authors	Çalışma Adı Paper Name	Ülke Country
1. Oturum		09:00-10:00	Kayıt/Registration		
		10:00-11:20	Açılış Konuşmaları / Opening Seramony	Onuruna TURJAF 2025 Kongresi düzenlenen Prof.Dr. Musa SARICA'nın özgeçmişinin okunması	
			Prof.Dr. Ahmet ŞEKEROĞLU	TBTF Dekanı/Dean of FAST	Türkiye
			Prof.Dr. Hasan ELEROĞLU	Editor of TURSTEP	Türkiye
			Prof.Dr. Musa SARICA	Editor of TURJAF	Türkiye
			Dr Şerafettin Çakal	TAGEM Genel. Müdür Yrd. / Deputy Director General of TAGEM)	Türkiye
			Prof.Dr. Hasan USLU	NOHU Rektörü/Rector of NOHU	Türkiye
			Dr. Cahit ÇELİK	Niğde Valisi/Governor of Niğde (Teşrifleri durumunda)	Türkiye
	1	Kongre Açılış Sunumu/ Opening Presentation of the Congress	Prof.Dr. Musa SARICA	Türkiye'de etlik piliç ıslahı alanında yapılan son çalışmalar ve gelecek beklentileri / Recent studies and future expectations in broiler breeding in Turkey	Türkiye
		11:20-11:40	Mola /Break		

28 Nisan 2025 Pazartesi / 28 April 2025 Monday

Salon 1923 – Hall 1923

Oral Presentation – Yüz Yüze - Face to Face

Oturum Başkanı / Moderator: Prof.Dr. Mustafa AVCI

Oturum Session	Sunum Presentation	Sunum Saati Presentation Time	Yazarlar Authors	Çalışma Adı Paper Name	Ülke Country
1. Oturum	2	11:40	Prof. Dr. Esvet AÇIKGÖZ	İklim Değişikliği ve Yem Bitkileri Islahına Etkileri / Climate Change and Its Effects on Forage Crops Breeding	Türkiye
	3	12:00	Dr. Hümeyra YAMAN	Plant Breeding in the Axis of Climate Change / İklim Değişikliği Ekseninde Bitki Islahı	Türkiye

Mola / Break

12:30 – 13:30

28 Nisan 2025 Pazartesi / 28 April 2025 Monday

Salon 1923 – Hall 1923

Oral Presentation – Yüz Yüze - Face to Face

Oturum Başkanı / Moderator: Prof.Dr. Ayhan GÖKÇE

Oturum Session	Sunum Presentation	Sunum Saati Presentation Time	Yazarlar Authors	Çalışma Adı Paper Name	Ülke Country
2. Oturum	4	13:30	Doç. Dr. Ahmet UÇAR	Developments in Layer Breeding / Yumurta Tavuğu Islahındaki Gelişmeler	Türkiye
	5	13:50	Dr. Şerif ÖZONGUN	Fruit Research Institute	Türkiye
	6	14:10	Director ÜnaL AKAY	Turkish viticulture and its status in the World / Türkiye Bağcılığı Ve Dünyadaki Yeri	Türkiye
	7	14:30	Dr. Uğur PIRLAK	Potato Production in Türkiye and the World / Türkiye ve Dünyada Patates Üretimi	Türkiye
	8	14:50	Director Can UYAR	Green Deal and New Agricultural Order\Yeşil Mutabakat ve Yeni Tarım Düzeni	Türkiye
	9	15:10	Prof.Dr. Ayhan GÖKÇE	İklim Değişikliğinin İstilacı Tarımsal Zararlı Türlerin Yayılma Dinamiklerine Etkisi	Türkiye
Mola / Break 15:30 – 15:50					

28 Nisan 2025 Pazartesi / 28 April 2025 Monday

Salon 1923 – Hall 1923

Oral Presentation – Yüz Yüze - Face to Face

Oturum Başkanı / Moderator: Prof.Dr. Halil TOKTAY

Oturum Session	Sunum Presentation	Sunum Saati Presentation Time	Yazarlar Authors	Çalışma Adı Paper Name	Ülke Country
3. Oturum	10	15:50	Hatice Dilaver, Kamil Fatih Dilaver	The Role of Artificial Intelligence in Increasing Milk Production on Dairy Farms: Yapay Zekanın Süt Çiftliklerinde Süt Üretimini Artırmadaki Rolü	Türkiye
	11	16:10	Hatice Dilaver, Kamil Fatih Dilaver	The Ecological Life of Eco-Villages	Türkiye
	12	16:30	Gülten Kaçar Avcı,*, Halil Toktay, Ramazan Canhilal	Niğde ili Patates Altın Kist Nematodu (Globodera rostochiensis) Popülasyonlarının Moleküler Tür Teşhisi	Türkiye
	13	16:50	Z. Erol1, H. Horasan, Jerina Rugji	Exploring the Impact of the Matrix on the Growth of Listeria monocytogenes	Türkiye
	14	17:10	Abdul Wakil Ayan, Sümeyra Gürkök	Biosurfactant Production by Aeromonas caviae	Türkiye
	15	17:30			

28 Nisan 2025 Pazartesi / 28 April 2025 Monday
Salon 1071 – Hall 1071
Oral Presentation - Yüz Yüze - Face to Face
Oturum Başkanı / Moderator: Prof. Dr. Esvet AÇIKGÖZ

Oturum Session	Sunum Presentation	Sunum Saati Presentation Time	Yazarlar Authors	Çalışma Adı Paper Name	Ülke Country
1. Oturum	1	13:30	Uğur Pırlak, Necmettin Oğuz Demir	Dünya'da ve Türkiye'de Patates Üretimi İle Yerli ve Milli Patates Geliştirme Çalışmaları	
	2	13:50	Özlem Erol	Alternative Protein Sources Used in Poultry Nutrition: Insects	Türkiye
	3	14:10	Serap Özer	Biostimulants Commonly Preferred in Potato Cultivation in Nevşehir Region and Their Effects on Production	Türkiye
	4	14:30	Muhammad Salim, Shahid Sattar	Effect of synthetıc insectıcıdes and botanıcal extract agaınst whıtefly, Bemısıa tabacı (Gennadıus) (Hemıptera: Aleyrodıdae) in dıfferent okra varıetıes	Pakistan
	5	14:50	Muhammad Salim	Lethal and sublethal effects of neem leaves extract (*Azadirachta indica)* against pink hibiscus mealy bug (*Maconellicoccus hirsutus*) (Hemiptera: Psudococcidae)	Pakistan
	6	15:10	Ergün Ergenekon*, Murat Özdal, Ömer Köksal Erman	Isolation of Cellulolytic Bacterium from the Digestive Tract of the Leptinotarsa decemlineata (Colorado Potato Beetle)	Türkiye
Mola / Break 15:10 – 15:30					

28 Nisan 2025 Pazartesi / 28 April 2025 Monday
Salon 1071 – Hall 1071
Oral Presentation - Yüz Yüze - Face to Face
Oturum Başkanı / Moderator: Prof. Dr. Ayhan CEYHAN

Oturum Session	Sunum Presentation	Saati Time	Yazarlar Authors	Çalışma Adı Paper Name	Ülke Country
2. Oturum	7	15:50	Tuğba Özkan	Kuraklık ve Sıcaklık Stresinin Patates Bitkisi Üzerine Etkileri	Türkiye
	8	16:10	Haydar Karadaş, Ali Eren, Altan Erkılınç, Mikail Eren Taşar, Melike Pelin Çekiç, Meliha İrem Aras, Ahmet Uçar	Effect of Genotype and Sex on Slaughter and Carcass Characteristics in Quail	Türkiye
	9	16:30	A. Çağlı, U. Pırlak, T. Özkan, Dr. N. O. Demir, G. Kaçar Avcı, E. İnan, M. Uzlaşır	Patates Mini Yumru Üretiminde Akan Su Kültürü, Aeroponik ve Topraklı Ortam Yöntemlerinin Verim ve Verim Unsurları Yönleriyle Karşılaştırılması	Türkiye
	10	16:50	Francisco Condori Tintaya, Tefide Kızıldeniz*, Oscar Fernandez Cutire, Junior Miranda Gutierrez, Yhudit Marili Mamani Llaca	Sustainable Irrigation Strategies for Enhancing Hass Avocado Yield in Arid Region of Tacna, Peru	Peru
	11	17:10	Mikail Yeniçeri, Ayşe Gül Filik, Hakan KIR, Gökhan Filik	Determination of the Effectiveness of Microbial Inoculants in Improving the Quality of Sorghum bicolor X Sorghum sudanese Silage	Türkiye
		17:30	Md. Habibur Rahman Mukul, Shamsunnaher, Md. Moniruzzaman, Afruz Zahan, Md. Niaz Morshed, Khandoker Khalid Ahmed, Md. Romel Bishwas, Mohammad Monsur, Md. Said Hossain, Most. Nilufar Yeasmin, Biswajit Karmakar Md Humayun Kabir, and Mir Mehedi Hasan*	AMMI and WAASB-Based Stability Model Analysis for Identifying High-Yielding Stable Blast Resistant Rice (Oryza sativa L.) Genotype	Bangladesh
		17:50	Mir Mehedi Hasana*, Zakaria Alamb, Md. Habibur Rahman Mukula, Afruz Zahana, Md. Niaz Morsheda, Khandoker Khalid Ahmeda, Md. Romel Bishwasa, Md. Abdul Gaffarc, Aparajita Badhand, Sanjida Aktere, Biswajit Karmakara, Md Humayun Kabira and Shamsunnahera	Selection of Stable and High-Yielding Short-Duration Inbred Rice (Oryza sativa L.) Genotypes for the Boro Season in Bangladesh Using WAASB and MTSI Indices	Bangladesh

28 Nisan 2025 Pazartesi / 28 April 2025 Monday

Salon 1299 – Hall 1299

Oral Presentation - Yüz Yüze - Face to Face

Oturum Başkanı / Moderator: Prof.Dr. Sedat KARAMAN

Oturum Session	Sunum Presentation	Sunum Saati Presentation Time	Yazarlar Authors	Çalışma Adı Paper Name	Ülke Country
1. Oturum	1	11:30	Hatice Nur Kılıç Özel, Mustafa Boğa	Natural Bee Products for Calf Feeding	Türkiye
	2	11:50	Dilek İşler, Levent A. Ünlenen, Ufuk Demirel	Türkiye'deki Bazı Patates Çeşit Ve Hatlarının Moleküler Karakterizasyonu Ve Genetik Çeşitliliği	Türkiye
	3	12:10	Buket Cetiner	Sensory and Texture Profile Analyze of Bulgur Samples	Türkiye

Mola / Break

12:30 – 13:30

28 Nisan 2025 Pazartesi / 28 April 2025 Monday
Salon 1299 – Hall 1299
Oral Presentation - Yüz Yüze - Face to Face
Oturum Başkanı / Moderator: Prof.Dr. Sibel CANOĞULLARI DOĞAN

Oturum Session	Sunum Presentation	Sunum Saati Presentation Time	Yazarlar Authors	Çalışma Adı Paper Name	Ülke Country
2. Oturum	4	13:30	Zeynep Ünal	Dijital Tarım	Türkiye
	5	13:50	Nisanur Alaca	Lamiaceae (ballıbabagiller)Türlerinin Peyzaj Tasarımında kullanım Olanakları	Türkiye
	6	14:10	Selin Kırım*, Muhammed Talha İnce	Sürdürülebilir Hayvansal Üretim İçin Su Mercimeği Potansiyeli	Türkiye
	7	14:30	Züleyha Aslan Ergenekon, Meryem Şengül Köseoğlu	Evaluation of Some Element Contents in Hypericum scabrum L. from Kükürtlü Village (Erzurum)	Türkiye
	8	14:50	Mohammad Abul Monsur, Mohammad Nazrul Islam, Mohammad Hasibur Rahman Hera, Quazi Shiren Akter Jahan	Rice, Zinc, disease severity, Di Impact of zinc fertilizer on zinc content rice varieties to curve the disease status at farmer's field in Bangladesh: Effect of micronutrient zinc fertilizer to increase disease resistance in farmers field	Bangladesh
	9	15:10	Anton J. Haverkort, Tefide Kizildeniz, Ayten Kubra Yagiz, Caner Yavuz, Ali Kaan Yetik, Ramazan İlhan Aytekin, Bayram Ali Yerlikaya	Exploring development, growth, yield and water use of several crops under climate change with LINTUL-MULTICROP, a statistical and mechanical simulation	Netherlands

Mola / Break
15:30 – 15:50

28 Nisan 2025 Pazartesi / 28 April 2025 Monday
Salon 1299 – Hall 1299
Oral Presentation - Yüz Yüze - Face to Face
Oturum Başkanı / Moderator: Doç.Dr. Hande BALTACIOĞLU

Oturum Session	Sunum Presentation	Sunum Saati Presentation Time	Yazarlar Authors	Çalışma Adı Paper Name	Ülke Country
3. Oturum	10	15:50	Katibe Sinem Coruk, Betül Oskaybaş-Emlek, Cansel Murat, Arife Nur Kanber, Hande Baltacıoğlu	Multivariate Analysis Of The Effect Of Different Pre-Treatment Methods Before Drying On Some Quality Properties Of Potato	Türkiye
	11	16:10	Cevher Özden	The Impact of Climate Change on Agricultural Insurance: The Role of Artificial Intelligence	Türkiye
	12	16:30	Mutlu Bulut	The Place of Animal Production in the Agricultural Sector: Economic Contributions and Future Perspectives	Türkiye
	13	16:50	Burak Şen, Ayşe Topal, Ali Kaan Yetik	Methods Used in Calculating Water Footprint in Agricultural Production	Türkiye
	14	17:10	Özgür Kıvılcım Kılınç, François Laurent	Niğde Patates Ekim Alanlarında Bulunan Solanum spp. (Köpek Üzümü) Biyotiplerinin Metribuzin Kullanımına Bağlı Dayanıklılık Mekanizmaları	Türkiye
	15	17:30	Özgür Kıvılcım Kılınç	Nohut'ta (Cicer arietinum L.) metribuzinin metabolizasyonu ve transferi	Türkiye
		17:50	Barsham M. A.*, Nabiela M. Elbagir, Barri M. E. S	Serum Selenium Levels in Dromedary Camel (Camelus dromedarius) Orally Supplemented with Sodium Selenite and a Mixture of Sodium Selenite and Sodium Sulphate	Sudan

28 Nisan 2025 Pazartesi / 28 April 2025 Monday
Salon 1 – Hall 1
Oral Presentation – Online
Oturum Başkanı / Moderator: Furkan Baş

Microsoft Teams Link: TURJAF 2025 - Online - Salon 1 / Hall 1 | General | Microsoft Teams

Oturum Session	Sunum Presentation	Sunum Saati Presentation Time	Yazarlar Authors	Çalışma Adı Paper Name	Ülke Country
1. Oturum	1	09:00	Anita Bhandari, Tirth Narayan Yadav, Ajita Pokhrel, Abhisek Shrestha	Effect on Germination of Mung Beans (Vigna radiata W.) Using Different	Nepal
	2	09:15	Tirth Narayan Yadav, Vijay Singh, Anita Bhandari, Abhisek Shrestha	Effect of Seed Priming Using Botanical Extracts on Germination of Okra (Abelmoschus esculentus Var. Nancy)	Nepal
	3	09:30	Vijay Singh*, Tirth Narayan Yadav, Nitu Kumari Mahato1, Anita Bhandari, Abhisek Shrestha	Evaluation of Early Rice Genotypes for Yield and Yield Attributing Characters in Madhesh Province of Nepal	Nepal
	4	09:45	Zeshan Ali1*, Zinanone Rosaire Brottier	Impact of Storage Conditions on the Stability and Bioactivity of Date Vinegar: A Comprehensive Study on Its Efficacy in Managing Metabolic Diseases	China
	5	10:00	Saber Y. Adam, Madesh Muniyappan, Wael Ennab, Abdelkareem A. Ahmed,,, Hosameldeen Mohamed Husien, Mohamed Osman Abdalrahem Essa, Demin Cai*	The Role of Zinc Supplementation in Reducing Oxidative Stress via Histone Modifications in Heat-Stressed Broiler Chickens	China
	6	10:15	Dilip Kumar Jha	Integrated Agriculture-Aquaculture Systems for sustainable development in Rural Nepal	Nepal
	7	10:30	Bolat Seidanov, Zeliha Selamoglu, Mesut Selamoglu	The Role of Artificial Intelligent in Agricultural Applications: Trend Methods	Kazakhstan
Mola / Break 10:45 – 11:15					

28 Nisan 2025 Pazartesi / 28 April 2025 Monday
Salon 1 – Hall 1
Oral Presentation – Online

PREFACE

Dear Colleagues…

The " 4th International Congress of the Turkish Journal of Agriculture - Food Science and Technology (TURJAF 2025) " has been held in Niğde/Türkiye on 28-30 April, 2025, with the participation of scientists working in agriculture and related sciences, with the aim of sharing scientific developments, proposing scientific solutions to international problems, increasing cooperation and creating scientific outputs that will benefit humanity by using international resources economically.

416 papers from 45 countries were presented to our congress. 225 of these papers came from foreign countries and 191 came from Türkiye. The countries of the participants who sent papers to the congress and the number of incoming articles are as follows; Albania (2), Algeria (10), Azerbaijan (1), Bangladesh (34), Benin (2), Burkina Faso (1), Cameroon (1), China (3), Côte d'Ivoire (2), Cyrus (3), Ecuador (2), Egypt (2), England (1), Ethiopia (6), Germany (1), Ghana (5), Hungary (1), India (4), Iran (8), Iraq (3), Italy (7), Kazakhstan (4), Kenya (6), Kırgızistan (1), Kosova (1), Morocco (1), Nepal (4), Netherlands (1), Nigeria (47), Pakistan (26), Peru (1), Philippines (4), Poland (1), Roma (1), Romania (2), Saudi Arabia (2), Somalia (2), Sri Lanka (8), Sudan (6), Tanzania (2), Tunissia (3), Uganda (1), USA (1), Zimbabwe (1) and Türkiye (191). The rate of international papers is 54.08% (more than one paper by the same author was received as one; (100×225/(225+191))= 54.08%).

At the congress; participants discussed such topics as animal production, crop production, aquaculture, food science and technologies, agricultural technologies, soil science, sustainable agricultural systems, agricultural economics, genetics, biology, agricultural ecology, landscape architecture and agricultural environment issues related to original, advanced technology on agriculture and natural life.

During the organization and congress phase of the congress; Assoc. Prof. Dr. Burak ŞEN, Dr. Mustafa DUMAN, Dr. Mehmet YETİŞEN, Dr. Brian TAINIKA, Dr. Ali Kaan YETIK, Ahmet AKYOL, Furkan BAŞ, Muhammet Talha İNCE, Musa SÜRÜCÜ, Beyazıt Abdurrahman ŞANLI, Orkun GENCER, Katibe Sinem CORUK, Ayşenur İNCE took on important duties in the congress secretariat.

We would like to express our gratitude to all our stakeholders who supported the successful realization of our congress and all the scientists who participated and supported us with their papers.

4th International Congress of the Turkish Journal of Agriculture - Food Science and Technology (TURJAF 2025) was supported by TUBITAK within the scope of "2223-B - Grant Program for Organizing Scientific Meeting within the Country".

Kind regards

ÖNSÖZ

Sayın Meslektaşlarımız…

Tarım ve ilgili bilim dallarında çalışan bilim insanlarının katılımıyla, bilimsel gelişmeleri paylaştıkları, uluslararası sorunlara bilimsel çözümler önermek, iş birliklerini artırarak uluslararası
kaynakların ekonomik kullanılmasıyla insanlığın yararına olacak bilimsel çıktıların oluşturulması amacıyla, 28-30 Nisan 2025 tarihinde Niğde/Türkiye'de "4. Uluslararası Türk Tarım - Gıda Bilimi ve Teknolojileri Dergisi Kongresi (TURJAF 2025)" gerçekleştirilmiştir.

Kongremize 40 ülkeden 416 bildiri sunulmuştur. Bu bildirilerin 225'i yurt dışından, 191'si ise Türkiye'den gelmiştir. Kongreye bildiri gönderen katılımcıların ülkeleri ve gelen makale sayıları şu şekildedir; Albania (2), Algeria (10), Azerbaijan (1), Bangladesh (34), Benin (2), Burkina Faso (1), Cameroon (1), China (3), Côte d'Ivoire (2), Cyrus (3), Ecuador (2), Egypt (2), England (1), Ethiopia (6), Germany (1), Ghana (5), Hungary (1), India (4), Iran (8), Iraq (3), Italy (7), Kazakhstan (4), Kenya (6), Kırgızistan (1), Kosova (1), Morocco (1), Nepal (4), Netherlands (1), Nigeria (47), Pakistan (26), Peru (1), Philippines (4), Poland (1), Roma (1), Romania (2), Saudi Arabia (2), Somalia (2), Sri Lanka (8), Sudan (6), Tanzania (2), Tunissia (3), Uganda (1), USA (1), Zimbabwe (1) ve Türkiye (191). Yurtdışı bildiri oranı %55.26'dır (aynı yazara ait birden fazla bildiriler tek olarak alınmıştır; (100×225/(225+191))= 54.08%).

Kongrede; tarım ve doğal hayat ile ilgili özgün ve ileri teknoloji ile ilgili; hayvansal üretim, bitkisel üretim, su ürünleri, gıda bilimi ve teknolojileri, tarım teknolojileri, toprak bilimi, sürdürülebilir tarım sistemleri, tarım ekonomisi, genetik, biyoloji, tarımsal ekoloji, peyzaj mimarlığı ve tarımsal çevre konuları katılımcılar tarafından tartışılmıştır.

Kongremizin düzenlenmesi ve kongre aşamasında; kongre sekretaryasında önemli görevler üstlenen Doç. Dr. Burak ŞEN, Dr. Mustafa DUMAN, Dr. Mehmet YETİŞEN, Dr. Brian TAINIKA, Dr. Ali Kaan YETIK, Ahmet AKYOL, Furkan BAŞ, Muhammet Talha İNCE, Musa SÜRÜCÜ, Beyazıt Abdurrahman ŞANLI, Orkun GENCER, Katibe Sinem CORUK, Ayşenur İNCE kongre organizasyonunu üstlenmişlerdir.

Kongremizin başarılı bir şekilde gerçekleştirilmesinde desteklerini esirgemeyen tüm paydaşlarımıza ve bildirileri ile katılarak destek veren tüm bilim insanlarına teşekkürü bir borç biliriz.

4. Uluslararası Türk Tarım - Gıda Bilimi ve Teknolojileri Dergisi Kongresi (TURJAF 2025), TÜBİTAK tarafından "2223-B - Yurt İçi Bilimsel Etkinlik Düzenleme Desteği Programı" kapsamında desteklenmiştir.

Saygılarımızla

Abstract

Turkey ranks in the top 10 in broiler production in the world. Almost all of the genetic material used in production in our country is provided by commercial international breeding companies. In order to reduce complete external dependency in this field and to have improved genetic stocks, broiler breeding studies have been restarted in Turkey since 2010. The studies, which started with a project (TÜBİTAK 109O334) to produce slow-growing broiler parents, have been put into practice by the Ministry of Agriculture and Forestry, General Directorate of Agricultural Research and Policies.
In 2015, with the purchase of 2 sire and 3 dam pure line parent material from an international breeding company, the studies were shifted to the fast growing broiler parent production and breeding field at Eskişehir Transitional Zone Agricultural Research Institute (EGKTAE). Studies were carried out in the fields of reproduction, selection, grand parent and parent production in pure lines between 2015-2025. On the other hand, the parents obtained were shared with the private sector. Doctoral and master's theses, international and national publications were made by utilizing the existing pure lines related to breeding studies. The material used in broiler breeding studies was registered as Anadolu-T. Within the scope of research and development studies, a device that provides automation of individual feed utilization test was developed at EGKTAE and started to be used in breeding studies. When the appropriate reproduction processes of the existing material are carried out, there is a potential for 25-30% of the genetic material used in broiler production in our country to be provided from Anadolu-T parents. In particular, in terms of epidemic diseases and pandemics seen in humans and animals, security risks and reducing external dependency, protecting the material and developing similar characteristics to commercial genotypes are important in terms of food safety.

Keywords: *Anadolu-T, Breeding studies, feed utilization test unit, food safety*

Inroduction

The majority of the increase in poultry meat production in the world originates from Asian countries. Especially the production increases in China, India, Japan, South Korea, Turkey and Iran have a significant contribution to this increase. While the market shares in North America and Europe have declined in poultry meat production, Brazil has become one of the important centers of poultry meat production in South America. Chicken meat production level in the world ranks second after pork. However, with the increases in chicken meat since 2010, the share of poultry meat in meat production rose to the first place in 2017. The majority of poultry meat comes from chicken meat. Considering that the increase in production in some species has stopped, in others there has been a decline and that some importing countries do not consume pork, poultry meat production is expected to increase in the future. Only two of the top 10 countries in world chicken meat production in 1970 were developing countries (Brazil and China). During this period, the USA provided approximately 31% of the world poultry meat production. In 2005, five of the top 10 countries were developing countries (China, Brazil, Mexico, India, and Iran) and three of them in Asia. Although the USA still maintains its leading position, China and Brazil ranked 2nd and 3rd. No other EU country produces chicken meat as much as Türkiye. Important chicken meat importing countries are in the Middle East, Africa, Central Asia, the Caucasus and some regions of the Russian Federation. In these markets, Turkey needs to compete with classical exporting countries such as Brazil, the USA and EU countries, as well as with Iran and Russia (Sarıca et al, 2018).

FAO, 2025.

Almost all of the hybrid material of chicken meat and eggs produced in Türkiye is imported as parents or partially grandparents. Parent stock (PS) and partially grand-parent (GP) stock are imported in increasing numbers every year for the production of hybrids used in egg and chicken meat production. Although Türkiye is among the few countries in the world in commercial egg and broiler chicken production, no significant progress has been made in breeder production to date. Breeding material is provided from abroad at a rate of 95.0-97.5% in egg production and 98.0% in poultry meat production (Sarıca et al., 2011; Sarıca et al., 2012; Sarıca et al., 2018; Sarıca et al., 2019a).

Based on these studies, broiler chicken breeding studies were restarted in 2015 at Eskişehir Transitional Zone Agricultural Research Institute (EGKTAE). These studies are still continuing with the selection of 3 dam and 2 sire lines, as well as grandparent and parent production. The first parent production was carried out in 2018 and shared with the private sector. The parent material, registered as ANADOLU-T, continued to be shared with the private sector until 2023. Especially in 2022, breeding companies have declared that they will reduce their breeding material exports to Turkey by 25-30%, which once again shows the importance of these breeding operations.

Breeding Studies with Pure Lines (2015-2025)

At the meeting held on 21.06.2011 at the General Directorate of Agricultural Research and Policies (TAGEM) with the participation of private sector, public and university partners, it was decided to restart broiler chicken breeding studies. It is planned to start the studies with the production of slow-growing broiler chicken parents. For this purpose, a poultry unit affiliated with Eskişehir Transitional Zone Agricultural Research Institute (EGKTAE) was established. The aim of the project is to provide a fast growing dam line and to bring the BAR and RIR lines in Ankara Poultry Research Institute into operation. Attempts to provide genetic material resulted in the importation of 3 fast growing dam and 2 sire lines. Therefore, the studies were changed to realize commercial broiler production. Multiplication processes were provided in the first year with the incubation of hatching eggs in August 2015, and processes such as selection, parent production and hybrid tests are continuing between 2016-2024 (Sarıca et al., 2016a; Sarıca et al., 2017; Sarıca et al., 2019b, Sarıca et al., 2019c).

Description of the Breeding Unit

The application area of the broiler parent breeding project is located within the borders of Mahmudiye district of Eskişehir province. Breeding farm consists of a pure line breeding unit and a hatchery 1 km away. Farm planned to be established on a land of 80 decares;

Administrative unit: It consists of dining hall, laboratory, personnel entrance disinfection unit, guest house and offices.

Chick rearing houses: There are 4 fully controlled rearing houses, each with 176 cages. Each poultry house has a capacity of 2000-2500 chicks. There is 1 rearing poultry house added to these poultry houses with 378 cages (5000-6000 chick capacity).

Pure line breeding house: It consists of 5088 cage units and 700 cock cage units. Broiler chickens between 5-10 weeks of age are reared in this house. .

Pedigree houses: There are 2 poultry houses with 160 family pens for 9-12 hens with 1 cock.

Pure line rooster houses: There are 2 poultry houses with 950 individual floor pens for individual rearing of cocks.

Grand-parent houses: There are 4 houses: 1 grower house (capacity of 5500 chickens), 1 dam line laying house (capacity of 5500 chickens), 2 sire line houses (capacities of 2000 chickens).
Hatchery: It is planned as a separate unit with a hatching capacity of 110.000 chicks, where the desired conditions for egg storage can be met. It has an automatic vaccination system.
Other units: There is an 800 m^2 closed warehouse, 2 hygiene units where 26 people can shower at the same time, vehicle hygiene entrance and security guard building.
Personnel: There is 1 coordinator Veterinarian, 6 Zootechnicians Agricultural Engineers and 1 Technician who provide management and research services in the breeding unit. Operations in the chicken houses are carried out by 35 workers, the number of whom varies according to periods. There is 1 Veterinarian and 9 technical personnel in the hatchery. There are permanent security personnel in the poultry house and hatchery units.

Characteristics of Pure Lines
Some characteristics of the pure lines used in breeding studies and numerical values of the base population are given in Table 2.

Table 2. Characteristics of imported parental lines and the number of first chicks produced (Sarıca et al., 2016b; Noubandiguim et al., 2021)

Pure line	Wing feathering	Number of chicks
Main dam line (A1)	Slow feathering	2086
Dam line (A2)	Fast feathering	371
Dam line (A3)	Slow feathering	188
Main sire line (B1)	Fast feathering	546
Sire line (B2)	Fast feathering	928

Selection Methods
Selection for each pure line is carried out in 3 stages. In the first stage, selection is applied according to body weight in pure lines that are ad libitum-fed until 3 weeks of age. In the second stage, selection is applied according to body weights at 5 or 6 weeks of age. In the third stage, the selection index value for cocks and hens is created by determining the breast width and length with the individual FCR test between 5-8 weeks of age. Families of 1 cock and 10 hens are formed for pedigreed production from selected cocks and hens. During the laying period, a selection is made at the family level according to the fertilization capacity of the cocks, and the final selection is applied by taking into account the egg production of the dam lines.
The material was registered as "ANADOLU-T" with the Official Gazette of the Republic of Turkey dated December 5, 2020 and numbered 31325.

Some Characteristics of the Pure Lines
Data on the parental characteristics of pure lines has been received since 2016. Instead of the results obtained in the breeding enterprise (EGKTAE), data obtained from a doctoral thesis were used in this study (Erensoy, 2022).

Table 3. Growth and laying period characteristics of pure lines (Erensoy, 2022; Erensoy and Sarıca, 2022; M: Male, F: Female)

Traits	Sex	Dam lines			Pure lines	
		A1	A2	A3	B1	B2
Body weight (8 weeks, g)	M	491.1	584.9	558.4	570.0	574.1
	F	465.7	536.5	551.2	540.2	544.6
Body weight (23 weeks, g)	M	3117.7	3319.7	3167.0	3445.7	3368.3
	F	2525.9	2562.2	2479.5	2691.5	2639.8
Body weight (60 weeks, g)	M	4586.0	4456.0	4002.0	4472.0	5042.0
	F	4034.6	4724.0	4488.6	4290.1	4855.3
Feed intake (g, 0-23 weeks)	M	11564	11438	11480	11172	11200
	F	9555	9632	9583	9506	9597
Livability (%, 0-23 weeks)		100	93.3	100.0	96.7	96.7
Livability (%, 24-64 weeks)		100	91.7	100.0	93.8	100.0
Egg production (24-64 weeks)		188	160	160	120	124
Egg weight (g)		66.6	67.9	65.1	67.3	68.2
Feed intake (g/day, 24-64 weeks)	M	140.1	150.1	140.1	137.5	137.5
	F	160.75	157.7	160.6	157.1	157.1

Some Characteristics of the Parents

Parents produced in the breeding enterprise were given to some integrated enterprises for trial purposes, and the parent efficiency was not tested in the breeding enterprise. All two-way crossed parental lines (6 sire lines and 2 dam lines) that could be obtained by reciprocal crossbreeding in pure lines were tested in a doctoral study (Erensoy, 2022). The genotype, which also allows sexing in day-old chicks according to wing feathering rate, is coded as ANADOLU-T. Some growth and laying period characteristics of these parent lines produced up to 64 weeks of age are given in Table 3 and 4.

Table 3. Growth and egg production characteristics of the female parents (Erensoy, 2022; Erensoy and Sarıca, 2022)

Traits	Dam line	Sire line
Body weight (8 weeks, g)	967.9	1340.4
Body weight (23 weeks, g)	2586.7	3329.8
Body weight (60 weeks, g)	4117.3	4463.2
Feed intake (g, 0-23 weeks)	11361	9093
Livability (%, 0-23 weeks)	88.9	96.7
Livability (%, 24-64 weeks)	96.3	100
Egg production (24-64 weeks)	161.9	-
Egg weight (g)	65.2	-
Feed intake (g/day, 24-64 weeks)	159.1	140.0

Table 4. Hatching results of ANADOLU-T and Ross-308 parents at 32 and 52 weeks of age (2 hatchings; Erensoy, 2022; Erensoy and Sarıca, 2022)

Genotype	Fertility (%)		Hatchability of fertile eggs (%)		Hatchability of set eggs (%)	
	32 weeks	52 weeks	32 weeks	52 weeks	32 weeks	52 weeks
ANADOLU-T	100.0	90.8	92.4	76.1	91.7	69.2
ANADOLU-T commercial	94.2	85.0	80.8	79.4	70.0	67.5
Ross-308	96.7	78.2	90.0	87.4	82.5	69.2

(Hatching eggs of ANADOLU-T commercial breeders were purchased from the private sector).

Broiler characteristics and comparison with commercial genotypes

Chicks obtained after selection in pure lines since 2016 are compared with a commercial genotype (Ross or Cobb) in terms of broiler characteristics. In addition to growth characteristics, carcass characteristics and body defects are also considered in these studies. The data obtained is also used for selection studies for the next generations. In the sire lines, 10-12 chicks from each family were also compared for broiler traits. The growth characteristics of ANADOLU-T hybrid produced from 12 hybrid groups by Erensoy (2022), ANADOLU-T Commercial and Ross-308 hybrids obtained from commercial enterprises at 42 days of age are given in Table 5.

Table 5. Performance of ANADOLU-T pure lines, commercial broilers and Ross-308 at 42 days of age (male-female mixed; Erensoy, 2022; Erensoy and Sarıca, 2023)

Genotype	Body weight (g)		Feed intake (g)		FCR		Livability (%)	
	32 weeks	52 weeks	32 weeks	52 weeks	32 weeks	52 weeks	32 weeks	52 weeks
A1-dam line	2307.7	2736.1	3971.0	4597.3	1.713	1.681	95.3	98.3
A2-dam line	2505.0	2333.8	4138.0	3954.7	1.653	1.695	93.3	98.3
A3-dam line	2371.5	2492.2	4130.1	4168.0	1.743	1.673	98.7	100.0
B1-sire line	2763.9	2773.6	4628.4	4756.2	1.687	1.718	95.3	96.7

Anadolu-T-hybrid	2790.1	2784.6	4636.2	4709.9	1.660	1.692	96.0	100.0
Anadolu-T-hybrid	2773.3	2858.0	4695.7	4800.9	1.697	1.680	96.7	96.7
Ross-308	2961.2	3136.2	4422.2	4485.5	1.520	1.430	97.3	100.0

Conclusion and Recommendations

Promising results were obtained from the studies carried out with pure lines introduced to Turkey in 2015. More than 250.000 parent stock breeders were given to the private sector between 2018-2023. It is thought that 10-15% of the broiler breeders requirement of our country can be met from this material by developing the current capacity at the grand-parent level. For these;

- Slaughtering broilers at an earlier age (33-35 days) due to the lack of feed efficiency at late slaughter (42 days),
- Compensating for vaccination-induced mortality in the first weeks by vaccination during hatching,
- Developing more effective selection strategies for feed efficiency and reproduction traits,
- By establishing a larger grand-parent facility, commercial companies can be provided with chicks at the desired capacity at any time of the year.

Considering these issues, a lifetime feed efficiency unit was developed and started to be used in 2023 with the TÜBİTAK-TAGEM project. On the other hand, genomic studies on pure lines will be initiated in 2024 and it is aimed to be used together with the classical selection practices.

Abstract

Turkey ranks in the top 10 in broiler production in the world. Almost all of the genetic material used in production in our country is provided by commercial international breeding companies. In order to reduce complete external dependency in this field and to have improved genetic stocks, broiler breeding studies have been restarted in Turkey since 2010. The studies, which started with a project (TÜBİTAK 109O334) to produce slow-growing broiler parents, have been put into practice by the Ministry of Agriculture and Forestry, General Directorate of Agricultural Research and Policies.
In 2015, with the purchase of 2 sire and 3 dam pure line parent material from an international breeding company, the studies were shifted to the fast growing broiler parent production and breeding field at Eskişehir Transitional Zone Agricultural Research Institute (EGKTAE). Studies were carried out in the fields of reproduction, selection, grand parent and parent production in pure lines between 2015-2025. On the other hand, the parents obtained were shared with the private sector. Doctoral and master's theses, international and national publications were made by utilizing the existing pure lines related to breeding studies. The material used in broiler breeding studies was registered as Anadolu-T. Within the scope of research and development studies, a device that provides automation of individual feed utilization test was developed at EGKTAE and started to be used in breeding studies. When the appropriate reproduction processes of the existing material are carried out, there is a potential for 25-30% of the genetic material used in broiler production in our country to be provided from Anadolu-T parents. In particular, in terms of epidemic diseases and pandemics seen in humans and animals, security risks and reducing external dependency, protecting the material and developing similar characteristics to commercial genotypes are important in terms of food safety.

Inroduction

The majority of the increase in poultry meat production in the world originates from Asian countries. Especially the production increases in China, India, Japan, South Korea, Turkey and Iran have a significant contribution to this increase. While the market shares in North America and Europe have declined in poultry meat production, Brazil has become one of the important centers of poultry meat production in South America. Chicken meat production level in the world ranks second after pork. However, with the increases in chicken meat since 2010, the share of poultry meat in meat production rose to the first place in 2017. The majority of poultry meat comes from chicken meat. Considering that the increase in production in some species has stopped, in others there has been a decline and that some importing countries do not consume pork, poultry meat production is expected to increase in the future. Only two of the top 10 countries in world chicken meat production in 1970 were developing countries (Brazil and China). During this period, the USA provided approximately 31% of the world poultry meat production. In 2005, five of the top 10 countries were developing countries (China, Brazil, Mexico, India, and Iran) and three of them in Asia. Although the USA still maintains its leading position, China and Brazil ranked 2nd and 3rd. No other EU country produces chicken meat as much as Türkiye. Important chicken meat importing countries are in the Middle East, Africa, Central Asia, the Caucasus and some regions of the Russian Federation. In these markets, Turkey needs to compete with classical exporting countries such as Brazil, the USA and EU countries, as well as with Iran and Russia (Sarıca et al, 2018).

FAO, 2025.

Almost all of the hybrid material of chicken meat and eggs produced in Türkiye is imported as parents or partially grandparents. Parent stock (PS) and partially grand-parent (GP) stock are imported in increasing numbers every year for the production of hybrids used in egg and chicken meat production. Although Türkiye is among the few countries in the world in commercial egg and broiler chicken production, no significant progress has been made in breeder production to date. Breeding material is provided from abroad at a rate of 95.0-97.5% in egg production and 98.0% in poultry meat production (Sarıca et al., 2011; Sarıca et al., 2012; Sarıca et al., 2018; Sarıca et al., 2019a).

Based on these studies, broiler chicken breeding studies were restarted in 2015 at Eskişehir Transitional Zone Agricultural Research Institute (EGKTAE). These studies are still continuing with the selection of 3 dam and 2 sire lines, as well as grandparent and parent production. The first parent production was carried out in 2018 and shared with the private sector. The parent material, registered as ANADOLU-T, continued to be shared with the private sector until 2023. Especially in 2022, breeding companies have declared that they will reduce their breeding material exports to Turkey by 25-30%, which once again shows the importance of these breeding operations.

Breeding Studies with Pure Lines (2015-2025)

At the meeting held on 21.06.2011 at the General Directorate of Agricultural Research and Policies (TAGEM) with the participation of private sector, public and university partners, it was decided to restart broiler chicken breeding studies. It is planned to start the studies with the production of slow-growing broiler chicken parents. For this purpose, a poultry unit affiliated with Eskişehir Transitional Zone Agricultural Research Institute (EGKTAE) was established. The aim of the project is to provide a fast growing dam line and to bring the BAR and RIR lines in Ankara Poultry Research Institute into operation. Attempts to provide genetic material resulted in the importation of 3 fast growing dam and 2 sire lines. Therefore, the studies were changed to realize commercial broiler production. Multiplication processes were provided in the first year with the incubation of hatching eggs in August 2015, and processes such as selection, parent production and hybrid tests are continuing between 2016-2024 (Sarıca et al., 2016a; Sarıca et al., 2017; Sarıca et al., 2019b, Sarıca et al., 2019c).

Description of the Breeding Unit

The application area of the broiler parent breeding project is located within the borders of Mahmudiye district of Eskişehir province. Breeding farm consists of a pure line breeding unit and a hatchery 1 km away. Farm planned to be established on a land of 80 decares;

Administrative unit: It consists of dining hall, laboratory, personnel entrance disinfection unit, guest house and offices.

Chick rearing houses: There are 4 fully controlled rearing houses, each with 176 cages. Each poultry house has a capacity of 2000-2500 chicks. There is 1 rearing poultry house added to these poultry houses with 378 cages (5000-6000 chick capacity).

Pure line breeding house: It consists of 5088 cage units and 700 cock cage units. Broiler chickens between 5-10 weeks of age are reared in this house. .

Pedigree houses: There are 2 poultry houses with 160 family pens for 9-12 hens with 1 cock.

Pure line rooster houses: There are 2 poultry houses with 950 individual floor pens for individual rearing of cocks.

Grand-parent houses: There are 4 houses: 1 grower house (capacity of 5500 chickens), 1 dam line laying house (capacity of 5500 chickens), 2 sire line houses (capacities of 2000 chickens).
Hatchery: It is planned as a separate unit with a hatching capacity of 110.000 chicks, where the desired conditions for egg storage can be met. It has an automatic vaccination system.
Other units: There is an 800 m^2 closed warehouse, 2 hygiene units where 26 people can shower at the same time, vehicle hygiene entrance and security guard building.
Personnel: There is 1 coordinator Veterinarian, 6 Zootechnicians Agricultural Engineers and 1 Technician who provide management and research services in the breeding unit. Operations in the chicken houses are carried out by 35 workers, the number of whom varies according to periods. There is 1 Veterinarian and 9 technical personnel in the hatchery. There are permanent security personnel in the poultry house and hatchery units.

Characteristics of Pure Lines
Some characteristics of the pure lines used in breeding studies and numerical values of the base population are given in Table 2.

Table 2. Characteristics of imported parental lines and the number of first chicks produced (Sarıca et al., 2016b; Noubandiguim et al., 2021)

Pure line	Wing feathering	Number of chicks
Main dam line (A1)	Slow feathering	2086
Dam line (A2)	Fast feathering	371
Dam line (A3)	Slow feathering	188
Main sire line (B1)	Fast feathering	546
Sire line (B2)	Fast feathering	928

Selection Methods
Selection for each pure line is carried out in 3 stages. In the first stage, selection is applied according to body weight in pure lines that are ad libitum-fed until 3 weeks of age. In the second stage, selection is applied according to body weights at 5 or 6 weeks of age. In the third stage, the selection index value for cocks and hens is created by determining the breast width and length with the individual FCR test between 5-8 weeks of age. Families of 1 cock and 10 hens are formed for pedigreed production from selected cocks and hens. During the laying period, a selection is made at the family level according to the fertilization capacity of the cocks, and the final selection is applied by taking into account the egg production of the dam lines.
The material was registered as "ANADOLU-T" with the Official Gazette of the Republic of Turkey dated December 5, 2020 and numbered 31325.

Some Characteristics of the Pure Lines
Data on the parental characteristics of pure lines has been received since 2016. Instead of the results obtained in the breeding enterprise (EGKTAE), data obtained from a doctoral thesis were used in this study (Erensoy, 2022).

Table 3. Growth and laying period characteristics of pure lines (Erensoy, 2022; Erensoy and Sarıca, 2022; M: Male, F: Female)

Traits	Sex	Dam lines			Pure lines	
		A1	A2	A3	B1	B2
Body weight (8 weeks, g)	M	491.1	584.9	558.4	570.0	574.1
	F	465.7	536.5	551.2	540.2	544.6
Body weight (23 weeks, g)	M	3117.7	3319.7	3167.0	3445.7	3368.3
	F	2525.9	2562.2	2479.5	2691.5	2639.8
Body weight (60 weeks, g)	M	4586.0	4456.0	4002.0	4472.0	5042.0
	F	4034.6	4724.0	4488.6	4290.1	4855.3
Feed intake (g, 0-23 weeks)	M	11564	11438	11480	11172	11200
	F	9555	9632	9583	9506	9597
Livability (%, 0-23 weeks)		100	93.3	100.0	96.7	96.7
Livability (%, 24-64 weeks)		100	91.7	100.0	93.8	100.0
Egg production (24-64 weeks)		188	160	160	120	124
Egg weight (g)		66.6	67.9	65.1	67.3	68.2
Feed intake (g/day, 24-64 weeks)	M	140.1	150.1	140.1	137.5	137.5
	F	160.75	157.7	160.6	157.1	157.1

Some Characteristics of the Parents

Parents produced in the breeding enterprise were given to some integrated enterprises for trial purposes, and the parent efficiency was not tested in the breeding enterprise. All two-way crossed parental lines (6 sire lines and 2 dam lines) that could be obtained by reciprocal crossbreeding in pure lines were tested in a doctoral study (Erensoy, 2022). The genotype, which also allows sexing in day-old chicks according to wing feathering rate, is coded as ANADOLU-T. Some growth and laying period characteristics of these parent lines produced up to 64 weeks of age are given in Table 3 and 4.

Table 3. Growth and egg production characteristics of the female parents (Erensoy, 2022; Erensoy and Sarıca, 2022)

Traits	Dam line	Sire line
Body weight (8 weeks, g)	967.9	1340.4
Body weight (23 weeks, g)	2586.7	3329.8
Body weight (60 weeks, g)	4117.3	4463.2
Feed intake (g, 0-23 weeks)	11361	9093
Livability (%, 0-23 weeks)	88.9	96.7
Livability (%, 24-64 weeks)	96.3	100
Egg production (24-64 weeks)	161.9	-
Egg weight (g)	65.2	-
Feed intake (g/day, 24-64 weeks)	159.1	140.0

Table 4. Hatching results of ANADOLU-T and Ross-308 parents at 32 and 52 weeks of age (2 hatchings; Erensoy, 2022; Erensoy and Sarıca, 2022)

Genotype	Fertility (%)		Hatchability of fertile eggs (%)		Hatchability of set eggs (%)	
	32 weeks	52 weeks	32 weeks	52 weeks	32 weeks	52 weeks
ANADOLU-T	100.0	90.8	92.4	76.1	91.7	69.2
ANADOLU-T commercial	94.2	85.0	80.8	79.4	70.0	67.5
Ross-308	96.7	78.2	90.0	87.4	82.5	69.2

(Hatching eggs of ANADOLU-T commercial breeders were purchased from the private sector).

Broiler characteristics and comparison with commercial genotypes

Chicks obtained after selection in pure lines since 2016 are compared with a commercial genotype (Ross or Cobb) in terms of broiler characteristics. In addition to growth characteristics, carcass characteristics and body defects are also considered in these studies. The data obtained is also used for selection studies for the next generations. In the sire lines, 10-12 chicks from each family were also compared for broiler traits. The growth characteristics of ANADOLU-T hybrid produced from 12 hybrid groups by Erensoy (2022), ANADOLU-T Commercial and Ross-308 hybrids obtained from commercial enterprises at 42 days of age are given in Table 5.

Table 5. Performance of ANADOLU-T pure lines, commercial broilers and Ross-308 at 42 days of age (male-female mixed; Erensoy, 2022; Erensoy and Sarıca, 2023)

Genotype	Body weight (g)		Feed intake (g)		FCR		Livability (%)	
	32 weeks	52 weeks	32 weeks	52 weeks	32 weeks	52 weeks	32 weeks	52 weeks
A1-dam line	2307.7	2736.1	3971.0	4597.3	1.713	1.681	95.3	98.3
A2-dam line	2505.0	2333.8	4138.0	3954.7	1.653	1.695	93.3	98.3
A3-dam line	2371.5	2492.2	4130.1	4168.0	1.743	1.673	98.7	100.0
B1-sire line	2763.9	2773.6	4628.4	4756.2	1.687	1.718	95.3	96.7

Anadolu-T-hybrid	2790.1	2784.6	4636.2	4709.9	1.660	1.692	96.0	100.0
Anadolu-T-hybrid	2773.3	2858.0	4695.7	4800.9	1.697	1.680	96.7	96.7
Ross-308	2961.2	3136.2	4422.2	4485.5	1.520	1.430	97.3	100.0

Conclusion and Recommendations

Promising results were obtained from the studies carried out with pure lines introduced to Turkey in 2015. More than 250.000 parent stock breeders were given to the private sector between 2018-2023. It is thought that 10-15% of the broiler breeders requirement of our country can be met from this material by developing the current capacity at the grand-parent level. For these;

- Slaughtering broilers at an earlier age (33-35 days) due to the lack of feed efficiency at late slaughter (42 days),
- Compensating for vaccination-induced mortality in the first weeks by vaccination during hatching,
- Developing more effective selection strategies for feed efficiency and reproduction traits,
- By establishing a larger grand-parent facility, commercial companies can be provided with chicks at the desired capacity at any time of the year.

Considering these issues, a lifetime feed efficiency unit was developed and started to be used in 2023 with the TÜBİTAK-TAGEM project. On the other hand, genomic studies on pure lines will be initiated in 2024 and it is aimed to be used together with the classical selection practices.

Turkish Viticulture And Its Status In The World

Akay UNAL[1], Oguzhan SOLTEKIN[2]

[1]MSc in Agricultural Engineer, Viticulture Research Institute, Manisa, Türkiye
[2]Ph.D in Agricultural Engineering, Viticulture Research Institute, Manisa, Türkiye

Abstract

Grape production of the world has observed to be around 72 million tons in nearly 6.6 million ha area by 2023. The largest area under vines will be in Spain, with 913,000 hectares, followed by France, Italy, China and Türkiye. In terms of production, the highest value is in China with 13.5 million tonnes, followed by Italy, France, USA and Spain. Türkiye ranks fifth in the world with 5.7% of the total vineyard area. In terms of grape production, it ranks seventh with 4.7% of the total world production. Approximately 53% of the total grape production in the country is used for table grapes, 29% for seedless raisins, 9% for seeded raisins and 9% for wine-must. It was found that the vineyard area in Türkiye decreased by 9.4% and grape production by 13.6% over the last five years (2018-2023). Due to unfavorable climatic conditions and the resulting mildew damage in the 2023 season, production has decreased. Türkiye is the leading exporter of high-quality sultana raisins. The most common grape variety is Sultan 7 (*V. Vinifera* L.), developed by the Manisa Viticulture Research Institute. Over the past decade, seedless raisin (sultana raisin) production has averaged around 1.1 million tons, accounting for 29% of total grape production. Türkiye, the world's leading raisin exporter, also accounts for about 30 percent of the world's raisin export. Over the last ten years, it has exported around 240,000 tonnes of dried grapes, worth an average of $458 million. The Aegean region alone accounts for 39.2% of the country's total grape production and 40.3% of the total area under vines. Moreover, Manisa province is the country's grape capital, producing about 70% of the region's total grape production and 91% of seedless raisin production.

Key Words: *Grape production, vineyards, trade, viticulture*

Türkiye Bağciliği Ve Dünyadaki Yeri

Özet

2023 yılı itibarıyla Dünyada yaklaşık 6.6 milyon ha alanda 72 milyon ton yaş üzüm üretimi olduğu gözlenmiştir. En fazla bağ alanı 913.000 ha ile İspanya'da bulunmakta ve bunu sırasıyla Fransa, İtalya, Çin ve Türkiye takip etmektedir. Üretim bakımından ise en yüksek değer 13.5 milyon ton ile Çin'de gerçekleşmekte ve sonrasında İtalya, Fransa, ABD, İspanya yer almaktadır. Türkiye, toplam bağ alanının %5.7'sine sahip olurken dünyada beşinci sıradadır. Üzüm üretimi bakımından ise dünyadaki toplam üretimin %4.7'sine sahip olarak yedinci sırada bulunmaktadır. Ülkede üretilen toplam üzüm miktarının yaklaşık %53'ü sofralık, %29'u çekirdeksiz kuru üzüm, %9'u çekirdekli kuru üzüm ve %9'u da şaraplık-şıralık olarak değerlendirilmektedir. Son 5 yıl incelendiğinde, 2018-2023 yılları arasında Türkiye bağ alanının %9.4, üzüm üretim miktarının ise %13.6 azaldığı tespit edilmiştir. 2023 sezonunda yaşanan olumsuz iklim şartları ve buna bağlı meydana gelen mildiyö zararı üretimde azalmaya neden olmuştur. Türkiye, yüksek kaliteye sahip Sultana tipi kuru üzümü ile ihracatta lider konumda bulunurken en yaygın üzüm çeşidi Manisa Bağcılık Araştırma Enstitüsü tarafından geliştirilen Sultan 7 (*V. Vinifera* L.)'dir. Son on yılda çekirdeksiz üzüm üretimi (sultana kuru üzümü) ortalama 1.1 milyon ton civarında gerçekleşmiş ve bu değer toplam üzüm üretiminin %29'unu oluşturmuştur. Ayrıca dünyanın önde gelen kuru üzüm ihracatçısı olan Türkiye, küresel kuru üzüm ihracatının yaklaşık %30'unu gerçekleştirmektedir. Buna göre son on yılda ortalama 458 milyon dolar değerinde yaklaşık 240.000 ton kuru üzüm ihraç etmiştir. Ülkenin toplam üzüm üretiminin yaklaşık %39.2'si ile toplam bağ alanının %40.3'ü tek başına Ege Bölgesi'nden sağlanmaktadır. Bununla birlikte bölgedeki toplam üzüm üretiminin yaklaşık %70'ine ve çekirdeksiz kuru üzüm üretiminin %91'ine sahip olan Manisa ili ülkenin üzüm üretimi bakımından başkenti konumundadır.

Anahtar Kelimeler: *Üzüm üretimi, bağ alanı, ticaret, bağcılık*

Climate Change and Plant Breeding: Preparing for the Future

Humeyra YAMAN[1]

[1] Ph. D in Agricultural Engineering, Central Research Institute of Field Crop, Ankara, Türkiye

Abstract

The food security of nations plays a determining role in today's and tomorrow's global agenda. Agriculture, which is the guarantor of food security, ranks among the sectors most affected by ongoing climate change. This critical environmental issue is broadly transforming weather patterns, temperatures, and ecosystems worldwide, impacting terrestrial and marine habitats. These gradual, long-term climatic shifts will inevitably influence agri-food systems, food production, and human livelihoods. Climate change, which has engulfed the entire world, makes the effects of abiotic and biotic stress conditions on plants more apparent. Unlike the gradually observed climatic changes over the years, the increasing frequency of extreme events makes the rapid development of new plant varieties essential. Considering the fact that the world has already warmed by 1°C compared to pre-industrial levels, it can be argued that—without a reduction in greenhouse gas emissions—this value will rise sharply after 2030. The increase in temperatures, the decrease in water resources, the irregularity of rainfall and, the insufficient rainfall during critical plant growth stages, the increase in severity of droughts, the aggressive spread of diseases, and the rapid emergence of new pathotypes underscore the paramount importance of plant breeding. In order to mitigate the agricultural impacts of climate change, it is essential not only to protect agricultural lands and modernize irrigation techniques but also- and most importantly- to develop resilient plant species. In addition to developing plant species resistant to heat, drought, cold and salinity, developing plant species resistant to diseases and pests, and introducing new productive and high-quality varieties to the market are indispensable for plant breeding. This approach enables better management of agricultural inputs and water needs while promoting soil health and reclamation. In addition, with climate-compatible plant breeding studies, more effective plant production patterns are created in agricultural production systems. Ensuring food security, maintaining ecological continuity, and effectively utilizing agricultural lands are all achievable through plant breeding. The continuously advancing new technologies are effectively utilized in breeding and in solving agricultural problems, thereby allowing for the anticipation of challenges that may arise in the future.

Key words: *extreme weather events, development of new plant varieties, use of agricultural technology, sustainability, food supply security*

İklim Değişikliği Ve Bitki Islahi: Geleceğe Hazirlik

Özet

Ülkelerin gıda güvenliği bugün ve gelecekte dünya gündeminin belirleyicisi rolündedir. Gıda güvenliğinin teminatı tarım ise yaşanan iklim değişikliğinden en fazla etkilenen faaliyet alanlarının başında gelmektedir. Bu önemli çevresel sorun genel anlamda, dünya genelinde hava koşullarını, sıcaklıkları ve ekosistemleri dönüştürmekte, karasal ve denizel habitatları etkilemektedir. İklimde yavaş yavaş başlayan bu uzun vadeli değişiklikler tarım-gıda sistemlerini, gıda üretimini ve insanların geçim kaynaklarını etkileyecektir. Tüm dünyayı etkisi altına alan iklim değişikliği bitkilerin abiyotik ve biyotik stres koşullarından etkilenmesini daha görünür hale getirmektedir. İklimsel anlamda yaşanan ve yıllar bazında gözlemlenen değişimlerin aksine ekstrem olaylarda yaşanan artışlar yeni bitki çeşitlerinin hızla geliştirilmesini elzem kılmaktadır. Dünyanın sanayi öncesi döneme göre 1°C ısındığı gerçeği düşünülürse, sera gazı emilsiyonlarında azalma olmazsa 2030'dan sonra hızla bu değerin artacağından söz edilebilir. Sıcaklıkların artması, su kaynaklarının azalması, yağışların düzensizleşmesi ve bitkilerin ihtiyaç duyduğu dönemde yeterli yağış alamaması, kuraklığın her geçen gün şiddetini artırması, hastalıkların agresif bir şekilde yayılması ve yeni patotiplerinin hızla ortaya çıkması bitki ıslahının ne denli önemli olduğunu gözler önüne sermektedir. Tarımsal olarak iklim değişikliğinin etkilerinin azaltılması için tarım alanlarının korunmasının yanı sıra sulama tekniklerinin modernize edilmesi ve en önemlisi dayanıklı bitki türlerinin geliştirilmesi elzemdir. Sıcağa, kurağa, soğuğa ve tuzluluğa dayanıklı bitki türlerini geliştirmenin yanı sıra hastalık ve zararlılara dayanıklı bitki türlerini geliştirmek, verimli ve kaliteli yeni çeşitleri piyasaya sürmek bitki ıslahının vazgeçilmezidir. Bu sayede hem tarımsal girdi ve su ihtiyaçlarının yönetilmesinin sağlanması, hem de toprak sağlığı ve ıslahının gerçekleştirilmesi mümkündür. Bunların yanı sıra iklime uyumlu bitki ıslahı çalışmaları ile tarımsal üretim sistemlerinde bitki üretim desenlerinin daha etkin olarak oluşturulması sağlanmış olur. Gıda güvenliğinin teminatı, ekolojilerin devamlılığı ve tarım topraklarından efektif olarak faydalanılmasının sağlanması bitki ıslahı ile mümkündür. Her geçen gün geliştirilen yeni teknolojiler de ıslahta ve tarımsal sorunların çözümde etkin kullanılmakta ve gelecekte karşılaşılabilecek sorunlar bu sayede öngörülebilmektedir.

Anahtar kelimeler: *ekstrem hava olayları, yeni bitki çeşitlerinin geliştirilmesi, tarımsal teknolojilerin kullanımı, sürdürülebilirlik, gıda arz güvenliği*

Digital Agriculture

Zeynep ÜNAL[1]

[1] Biosystems Engineering, Faculty of Agricultural Sciences and Technologies, Niğde Ömer Halisdemir University, Turkey

Abstract

Agriculture has been a sector of strategic importance throughout human history. Today, with the increasing population, climate change, and other global factors, the digitalization process in agriculture has accelerated. The digitalization of the agricultural sector aims to enhance the efficiency of resources and ensure environmental sustainability through the integration of digital technologies such as sensors, robotic systems, and artificial intelligence. This digital transformation will enable agricultural production to be carried out more easily within the modern living conditions that younger generations currently experience and will continue to experience in the future. In this process, interdisciplinary technologies such as the Internet of Things, sensor technologies, artificial intelligence, geographic information systems, and decision support mechanisms play a critical role in achieving data-driven sustainable agriculture. The integration of these technologies through digitalization will create opportunities to further increase the efficiency and sustainability of resources in agriculture. This study comprehensively discusses the concept of digital agriculture and the technologies related to this concept. With Agriculture 4.0, advanced technologies such as sensors, artificial intelligence, big data, unmanned aerial vehicles and land vehicles have been integrated into the agricultural sector. This integration process plays a critical role in ensuring precision and efficiency in agriculture. While precision agriculture offers an approach to local production optimization based on environmental factors, smart agriculture is characterized by the inclusion of information technologies in decision support processes. Digital agriculture is a broader framework that encompasses the management of all agricultural processes through digital platforms and the guidance of artificial intelligence-based robotic systems.

Key Words: *Agriculture, Agricultural Technologies, Agriculture 4.0, Digital Agriculture, Precision Agriculture.*

Dijital Tarım

Özet

Tarım, insanlık tarihi boyunca stratejik öneme sahip bir sektör olmuştur. Günümüzde artan nüfus, iklim değişikliği ve diğer küresel etmenlerle birlikte tarımda dijitalleşme süreci hız kazanmıştır. Tarım sektöründeki dijitalleşme süreci, sensörler, robotik sistemler ve yapay zeka gibi dijital teknolojilerin entegrasyonu yoluyla, kaynakların verimliliğini artırmayı ve çevresel sürdürülebilirliği sağlamayı hedeflemektedir. Bu dijital dönüşüm, genç nesillerin sahip olduğu ve gelecekte sahip olacağı modern yaşam koşullarında tarımsal üretimin nispeten daha kolay bir şekilde gerçekleşmesine olanak tanıyacaktır. Bu süreçte disiplinler arası teknolojiler olan nesnelerin interneti, sensör teknolojileri, yapay zekâ, coğrafi bilgi sistemleri ve karar destek mekanizmaları, veri odaklı sürdürülebilir tarımın gerçekleştirilmesinde kritik bir rol oynamaktadır. Dijitalleşmenin bu teknolojilerle entegrasyonu ile oluşturduğu fırsatlar tarımda kaynakların verimliliğini ve sürdürülebilirliğini artıracaktır.
Bu çalışmada, dijital tarım kavramı ve bu kavrama bağlı teknolojiler kapsamlı bir biçimde ele alınmaktadır. Tarım 4.0 ile birlikte, sensörler, yapay zekâ, büyük veri, insansız hava araçları ve kara araçları gibi ileri teknolojiler tarım sektörüne entegre edilmiştir. Bu entegrasyon süreci, tarımda hassasiyet ve verimlilik sağlamak için kritik bir rol oynamaktadır. Hassas tarım, çevresel faktörlere dayalı olarak yerel üretim optimizasyonuna yönelik bir yaklaşım sunarken, akıllı tarım bilişim teknolojilerin karar destek süreçlerine dâhil edilmesiyle karakterize edilmektedir. Dijital tarım ise tüm tarımsal süreçlerin dijital platformlar aracılığıyla yönetilmesini ve yapay zeka tabanlı robotik sistemlerin yönlendirilmesini kapsayan daha geniş bir çerçevedir.

In Türkiye, genetic research on egg production has been carried out by the Poultry Research Institute (PRI) since 1930. In 1995, 10 pure lines, including White Layers (Black, Brown, Blue and Maroon) and Brown Layers (Rır-I, Rır-II, Bar-I, Bar-II, Col. and Line-54), were brought to PRI from Canada. In 2010, 1 more white layer line (D-229) was brought from the Czech Republic. This line was selected for high egg production (D-229yyv) and low live weight (D-229dca) traits and two synthetic lines were created. Four layer hybrids named ATABEY, ATAK, ATAK-S and AKBAY have been registered from the existing lines. Breeding has been carried out on these lines for many years in terms of egg count, egg weight, age at sexual maturity and weight at sexual maturity. With these 4 basic features, the main target has been to increase the amount of eggs obtained per female in both pure lines and hybrids. In the last 10 years, 8.7, 10.9, 20.0, 13.7, 11.8, 12.7, 8.2, 9.4, 1.9, 18.9 and 14.3% progress has been achieved in the amount of eggs obtained per female in D-229yyv, D-229dca, Black, Blue, Maroon, Brown, COL., Line-54, Bar-I, Bar-II, Rır-I and Rır-II lines, respectively. As a result of the breeding activities it has carried out, PRI meets approximately 15% of the layer parents needed by our country. As a result, it is aimed to increase this required rate by further improving hybrid performances in the coming years with the breeding studies carried out.

Keywords: *Layer, Egg production, Breeding, Line, Hybrid*

Yumurtacı Tavuk Islahındaki Gelişmeler

Özet

Türkiye'de yumurta verimi üzerine genetik araştırmalar 1930'dan beri Tavukçuluk Araştırma Enstitüsü (TAE) tarafından yürütülmektedir. TAE'ye Kanada'dan 1995 yılında Beyaz Yumurtacı (Black, Brown, Blue ve Maroon) ve Kahverengi Yumurtacı (Rır-I, Rır-II, Bar-I, Bar-II, Col. ve Line-54) olmak üzere 10 saf hat getirilmiştir. 2010 yılında Çekya'dan 1 adet daha (D-229) beyaz yumurtacı hat getirilmiştir. Bu hat kendi içinde yüksek yumurta verimi (D-229yyv) ve düşük canlı ağırlık (D-229dca) özellikleri yönünde selekte edilerek iki sentetik hat oluşturulmuştur. Mevcut hatlardan ATABEY, ATAK, ATAK-S ve AKBAY isimli 4 adet yumurtacı hibrit tescil edilmiştir. Bu hatlar üzerinde uzun yıllardır yumurta sayısı, yumurta ağırlığı, cinsel olgunluk yaşı ve cinsel olgunluk ağırlığı özelliklerinde ıslah yapılmaktadır. Bu 4 temel özellik ile dişi başına elde edilen yumurta miktarının hem saf hatlarda hem de hibritlerde artırılması asıl hedef olmuştur. Son 10 yıllık süreçte D-229yyv, D-229dca, Black, Blue, Maroon, Brown, COL., Line-54, Bar-I, Bar-II, Rır-I ve Rır-II hatlarında dişi başına elde edilen yumurta miktarında sırasıyla %8.7, 10.9, 20.0, 13.7, 11.8, 12.7, 8.2, 9.4, 1.9, 18.9 ve 14.3 ilerleme sağlanmıştır. TAE yapmış olduğu ıslah faaliyetleri sonucunda ülkemizin ihtiyaç duyduğu yumurtacı ebeveynin yaklaşık %15'ini karşılamaktadır. Sonuç olarak, yapılan ıslah çalışmaları ile gelecek yıllarda hibrit performanslarının daha da geliştirilerek ihtiyaç duyulan bu oranın artırılması hedeflenmektedir.

Anahtar Kelimeler*: Yumurtacı, Yumurta verimi, Islah, Hat, Hibrit*

Abstract

Agriculture has been a sector of strategic importance throughout human history. Today, with the increasing population, climate change, and other global factors, the digitalization process in agriculture has accelerated. The digitalization of the agricultural sector aims to enhance the efficiency of resources and ensure environmental sustainability through the integration of digital technologies such as sensors, robotic systems, and artificial intelligence. This digital transformation will enable agricultural production to be carried out more easily within the modern living conditions that younger generations currently experience and will continue to experience in the future. In this process, interdisciplinary technologies such as the Internet of Things, sensor technologies, artificial intelligence, geographic information systems, and decision support mechanisms play a critical role in achieving data-driven sustainable agriculture. The integration of these technologies through digitalization will create opportunities to further increase the efficiency and sustainability of resources in agriculture. This study comprehensively discusses the concept of digital agriculture and the technologies related to this concept. With Agriculture 4.0, advanced technologies such as sensors, artificial intelligence, big data, unmanned aerial vehicles and land vehicles have been integrated into the agricultural sector. This integration process plays a critical role in ensuring precision and efficiency in agriculture. While precision agriculture offers an approach to local production optimization based on environmental factors, smart agriculture is characterized by the inclusion of information technologies in decision support processes. Digital agriculture is a broader framework that encompasses the management of all agricultural processes through digital platforms and the guidance of artificial intelligence-based robotic systems.

Dijital Tarım

Özet

Tarım, insanlık tarihi boyunca stratejik öneme sahip bir sektör olmuştur. Günümüzde artan nüfus, iklim değişikliği ve diğer küresel etmenlerle birlikte tarımda dijitalleşme süreci hız kazanmıştır. Tarım sektöründeki dijitalleşme süreci, sensörler, robotik sistemler ve yapay zeka gibi dijital teknolojilerin entegrasyonu yoluyla, kaynakların verimliliğini artırmayı ve çevresel sürdürülebilirliği sağlamayı hedeflemektedir. Bu dijital dönüşüm, genç nesillerin sahip olduğu ve gelecekte sahip olacağı modern yaşam koşullarında tarımsal üretimin nispeten daha kolay bir şekilde gerçekleşmesine olanak tanıyacaktır. Bu süreçte disiplinler arası teknolojiler olan nesnelerin interneti, sensör teknolojileri, yapay zekâ, coğrafi bilgi sistemleri ve karar destek mekanizmaları, veri odaklı sürdürülebilir tarımın gerçekleştirilmesinde kritik bir rol oynamaktadır. Dijitalleşmenin bu teknolojilerle entegrasyonu ile oluşturduğu fırsatlar tarımda kaynakların verimliliğini ve sürdürülebilirliğini artıracaktır.
Bu çalışmada, dijital tarım kavramı ve bu kavrama bağlı teknolojiler kapsamlı bir biçimde ele alınmaktadır. Tarım 4.0 ile birlikte, sensörler, yapay zekâ, büyük veri, insansız hava araçları ve kara araçları gibi ileri teknolojiler tarım sektörüne entegre edilmiştir. Bu entegrasyon süreci, tarımda hassasiyet ve verimlilik sağlamak için kritik bir rol oynamaktadır. Hassas tarım, çevresel faktörlere dayalı olarak yerel üretim optimizasyonuna yönelik bir yaklaşım sunarken, akıllı tarım bilişim teknolojilerin karar destek süreçlerine dâhil edilmesiyle karakterize edilmektedir. Dijital tarım ise tüm tarımsal süreçlerin dijital platformlar aracılığıyla yönetilmesini ve yapay zeka tabanlı robotik sistemlerin yönlendirilmesini kapsayan daha geniş bir çerçevedir.

Anahtar Kelimeler: *Tarım, Tarım Teknolojileri, Tarım 5.0, Dijital Tarım, Hassas Tarım*

* Ankara Üniversitesi, Ziraat Fakültesi, Zootekni Bölümü, Ankara/Türkiye

In Türkiye, genetic research on egg production has been carried out by the Poultry Research Institute (PRI) since 1930. In 1995, 10 pure lines, including White Layers (Black, Brown, Blue and Maroon) and Brown Layers (Rır-I, Rır-II, Bar-I, Bar-II, Col. and Line-54), were brought to PRI from Canada. In 2010, 1 more white layer line (D-229) was brought from the Czech Republic. This line was selected for high egg production (D-229yyv) and low live weight (D-229dca) traits and two synthetic lines were created. Four layer hybrids named ATABEY, ATAK, ATAK-S and AKBAY have been registered from the existing lines. Breeding has been carried out on these lines for many years in terms of egg count, egg weight, age at sexual maturity and weight at sexual maturity. With these 4 basic features, the main target has been to increase the amount of eggs obtained per female in both pure lines and hybrids. In the last 10 years, 8.7, 10.9, 20.0, 13.7, 11.8, 12.7, 8.2, 9.4, 1.9, 18.9 and 14.3% progress has been achieved in the amount of eggs obtained per female in D-229yyv, D-229dca, Black, Blue, Maroon, Brown, COL., Line-54, Bar-I, Bar-II, Rır-I and Rır-II lines, respectively. As a result of the breeding activities it has carried out, PRI meets approximately 15% of the layer parents needed by our country. As a result, it is aimed to increase this required rate by further improving hybrid performances in the coming years with the breeding studies carried out.

Keywords: *Layer, Egg production, Breeding, Line, Hybrid*

Yumurtacı Tavuk Islahındaki Gelişmeler

Özet

Türkiye'de yumurta verimi üzerine genetik araştırmalar 1930'dan beri Tavukçuluk Araştırma Enstitüsü (TAE) tarafından yürütülmektedir. TAE'ye Kanada'dan 1995 yılında Beyaz Yumurtacı (Black, Brown, Blue ve Maroon) ve Kahverengi Yumurtacı (Rır-I, Rır-II, Bar-I, Bar-II, Col. ve Line-54) olmak üzere 10 saf hat getirilmiştir. 2010 yılında Çekya'dan 1 adet daha (D-229) beyaz yumurtacı hat getirilmiştir. Bu hat kendi içinde yüksek yumurta verimi (D-229yyv) ve düşük canlı ağırlık (D-229dca) özellikleri yönünde selekte edilerek iki sentetik hat oluşturulmuştur. Mevcut hatlardan ATABEY, ATAK, ATAK-S ve AKBAY isimli 4 adet yumurtacı hibrit tescil edilmiştir. Bu hatlar üzerinde uzun yıllardır yumurta sayısı, yumurta ağırlığı, cinsel olgunluk yaşı ve cinsel olgunluk ağırlığı özelliklerinde ıslah yapılmaktadır. Bu 4 temel özellik ile dişi başına elde edilen yumurta miktarının hem saf hatlarda hem de hibritlerde artırılması asıl hedef olmuştur. Son 10 yıllık süreçte D-229yyv, D-229dca, Black, Blue, Maroon, Brown, COL., Line-54, Bar-I, Bar-II, Rır-I ve Rır-II hatlarında dişi başına elde edilen yumurta miktarında sırasıyla %8.7, 10.9, 20.0, 13.7, 11.8, 12.7, 8.2, 9.4, 1.9, 18.9 ve 14.3 ilerleme sağlanmıştır. TAE yapmış olduğu ıslah faaliyetleri sonucunda ülkemizin ihtiyaç duyduğu yumurtacı ebeveynin yaklaşık %15'ini karşılamaktadır. Sonuç olarak, yapılan ıslah çalışmaları ile gelecek yıllarda hibrit performanslarının daha da geliştirilerek ihtiyaç duyulan bu oranın artırılması hedeflenmektedir.

Abstract

This research paper examines the transformative impact of artificial intelligence (AI) on dairy farming, focusing on how predictive analytics, automated milking systems (AMS), and Internet of Things (IoT) sensors optimize milk production, improve animal welfare, and enhance operational efficiency. Case studies and recent data are used to explore AI's effectiveness in addressing environmental stress factors, ensuring sustainable practices, and responding to market demands. The paper also highlights the challenges of AI adoption in dairy farming and its future potential. Artificial intelligence (AI) has introduced a transformative shift in the agricultural sector, enhancing productivity, efficiency, and sustainability. Due to the complexity of operations and the need for precise animal health management, dairy farming is among the sectors most affected by this transformation. Farmers increasingly rely on AI-powered technologies to improve milk productivity, enhance animal welfare, and ensure environmental sustainability. Predictive analytics, automated milking systems (AMS), and Internet of Things (IoT) sensors stand out as key applications in this area.This article analyzes the transformative impact of AI on dairy farming operations through case studies and recent data. It focuses on how AI optimizes production, enhances animal welfare, and improves operational efficiency. Additionally, it examines AI's effectiveness in addressing environmental stress factors, promoting sustainable agricultural practices, and responding to fluctuating market demands. In the following sections, the challenges and future potential of AI in dairy farming will also be discussed.

Yapay Zekanın Süt Çiftliklerinde Süt Üretimini Artırmadaki Rolü

Özet

Bu araştırma makalesi, yapay zekanın (YZ) süt çiftçiliği üzerindeki dönüştürücü etkisini incelemekte ve öngörücü analizlerin, otomatik sağım sistemlerinin (AMS) ve Nesnelerin İnterneti (IoT) sensörlerinin süt üretimini nasıl optimize ettiğine, hayvan refahını nasıl iyileştirdiğine ve operasyonel verimliliği nasıl artırdığına odaklanmaktadır. Vaka çalışmaları ve güncel veriler aracılığıyla, yapay zekanın çevresel stres faktörlerini ele alma, sürdürülebilir uygulamaları sağlama ve pazar taleplerine yanıt verme konusundaki etkinliği incelenmektedir. Makale ayrıca yapay zekanın süt çiftçiliğindeki zorluklarına ve gelecekteki potansiyeline değinilecektir. Bu makalede, yapay zekanın süt çiftçiliği operasyonları üzerindeki dönüştürücü etkisi vaka çalışmaları ve güncel veriler ışığında analiz edilmektedir. Özellikle, yapay zekanın üretim optimizasyonu, hayvan refahı ve operasyonel verimliliği nasıl artırdığı ele alınacaktır. Bunun yanında, yapay zekanın çevresel stres faktörlerine çözüm sunma, sürdürülebilir tarım uygulamalarını teşvik etme ve değişken pazar taleplerine uyum sağlama yeteneği detaylı olarak incelenecektir. Makalenin ilerleyen bölümlerinde, bu teknolojilerin kullanımında karşılaşılan zorluklar ve gelecekteki gelişim potansiyeli de değerlendirilecektir. Yapay zeka (YZ), çevresel stres, işgücü maliyetleri ve pazar talepleri gibi uzun süredir devam eden zorluklara yenilikçi çözümler sunarak süt endüstrisini dönüştürmektedir. Otomatik sağım sistemleri (AMS), öngörücü analizler ve IoT teknolojilerinin entegrasyonu sayesinde üretkenlik artar, hayvan refahı garanti altına alınır ve sürdürülebilirlik teşvik edilir. Ancak, yapay zekanın süt endüstrisindeki tüm potansiyelini ortaya çıkarabilmek için maliyetler, eğitim ve veri entegrasyonu ile ilgili zorlukların ele alınması gerekmektedir. Başarıya ulaşmak için çiftçilerin bu yeni teknolojilere uyum sağlaması ve gerekli uzmanlıkların geliştirilmesi hayati öneme sahiptir.

Anahtar Kelimeler: *Süt,Üretim,Çiftlik*

Introduction

Artificial intelligence (AI) has introduced a transformative shift in the agricultural sector, enhancing productivity, efficiency, and sustainability. Due to the complexity of operations and the need for precise animal health management, dairy farming is among the sectors most affected by this transformation. Farmers increasingly rely on AI-powered technologies to improve milk productivity, enhance animal welfare, and ensure environmental sustainability. Predictive analytics, automated milking systems (AMS), and Internet of Things (IoT) sensors stand out as key applications in this area.This article analyzes the transformative impact of AI on dairy farming operations through case studies and recent data. It focuses on how AI optimizes production, enhances animal welfare, and improves operational efficiency. Additionally, it examines AI's effectiveness in addressing environmental stress factors, promoting sustainable agricultural practices, and responding to fluctuating market demands. In the following sections, the challenges and future potential of AI in dairy farming will also be discussed. Today, dairy farms operate in a competitive and challenging environment, pressured to increase milk production while maintaining animal welfare standards and minimizing environmental impact. Climate change exacerbates these challenges by increasing the frequency of heatwaves and extreme weather events, which affect animal health and milk productivity (Cullen et al., 2020). AI offers promising solutions by using advanced algorithms to predict outcomes and optimize farm management strategies (Dairy Foods, 2024). The use of AI systems to monitor and manage livestock in real-time marks a significant shift from traditional farming methods, paving the way for greater efficiency and sustainability

The Impact of AI Applications on Dairy Farming

Production Optimization and Yield Improvement

AI technologies improve milk production efficiency by supporting decision-making through data analytics and predictive models. Automated milking systems (AMS) optimize milk yield and milking frequency while minimizing human intervention. AI-powered algorithms monitor the health and productivity of cows in real-time, allowing for individualized milking schedules. As a result, unnecessary milking or animal stress is avoided, milk quality improves, and production costs decrease.

AI-based tools analyze large datasets from multiple sources, such as animal feed intake, body weight, and environmental conditions, to predict milk yield with high accuracy. Studies have shown that predictive models based on machine learning algorithms can achieve prediction accuracy as high as 87%, helping farmers forecast and manage variations in milk yield (MDPI). In addition, AI plays a role in product innovation by analyzing consumer preferences and guiding the development of new products tailored to market demands (Dairy Foods, 2024). This data-driven approach significantly shortens product development cycles and aligns production with consumer needs.

Enhancing Animal Welfare

AI-based IoT sensors provide continuous data on cows' health and well-being. Biometrics such as body temperature, walking distance, feed intake, and milk yield help in the early detection of diseases and the identification of potential health issues. These systems also accurately detect heat periods, enhancing reproductive efficiency. This approach ensures animal health is maintained while reducing veterinary costs.

IoT sensors provide real-time data on cow health, including heart rate, temperature, and rumination patterns. These data streams are processed by AI models, enabling the early detection of health issues and minimizing production losses (Dairy Reporter, 2024). For example, monitoring calf health in real-time allows farmers to intervene promptly, reduce mortality rates, and improve long-term productivity.

The Impact of Environmental Stress

Heat stress is a critical issue in dairy farming, reducing both the quantity and quality of milk produced. AI-powered models that predict temperature-humidity indices (THI) help farmers adjust feeding and cooling strategies, minimizing the impact of extreme weather on milk production (Cullen et al., 2020). Additionally, automated climate control systems integrated with predictive algorithms optimize indoor temperatures and ventilation.

Environmental variables pose significant stress in dairy farming. Factors such as temperature and humidity can increase animal stress levels, resulting in decreased milk production. AI-powered systems analyze weather data to provide early alerts and optimize farm conditions. For example, AI-integrated climate control systems activate cooling mechanisms when temperatures rise, ensuring animal well-being.

Moreover, AI technologies optimize resource consumption and waste management processes, contributing to environmental sustainability. Algorithms that regulate feed consumption and water usage help reduce farms' carbon footprints. Thus, environmental impacts are minimized while achieving economic savings.

Adapting to Market Demands and Gaining Competitive Advantage

AI-powered analytics tools enable farmers to predict consumer demand for dairy products and respond promptly. Data obtained from digital platforms helps farms develop better marketing strategies. AI provides flexibility in production planning, enabling farmers to quickly adapt to market changes and gain a competitive edge.
AI-powered systems optimize production schedules and monitor equipment health, predicting maintenance needs to prevent downtime (Dairy Foods, 2024). An example is the AI-powered cheese yield optimization tool developed by Ever.Ag, which provides actionable insights based on real-time data to improve productivity and quality.
Ever.Ag's cheese yield optimization tool exemplifies how AI enhances efficiency in milk processing. The tool analyzes historical production data to provide real-time recommendations, improving cheese yield and reducing waste (Dairy Reporter, 2024). Similarly, SPX Flow's SmartDry System uses AI to control moisture levels during production, ensuring consistent product quality.
Research shows that farms adopting AI technologies experience significant improvements in milk yield and operational efficiency. Farms equipped with AMS reported a 30% reduction in labor costs and a 10-20% increase in efficiency (Dairy Reporter, 2024).

Challenges in the Use of AI
The integration of AI technologies into dairy farming presents several challenges. First, the installation and maintenance of these systems can be costly, posing a significant barrier for small-scale farms. Additionally, data security and privacy concerns arise with the use of AI systems. Farmers need education and technical support to use these technologies effectively. Another challenge is the potential impact of these technologies on traditional labor. AI and automation reduce the need for manual labor, potentially leading to job losses. Therefore, retraining programs are necessary to help workers adapt to new technologies and remain employed.

Performance Metrics of AI Tools in Dairy Farms
Research shows that farms adopting AI technologies experience significant improvements in milk yield and operational efficiency. Farms equipped with AMS reported a 30% reduction in labor costs and a 10-20% increase in efficiency (Dairy Reporter, 2024).

Case Study: AI in Cheese Production Optimization
Ever.Ag's cheese yield optimization tool exemplifies how AI enhances efficiency in milk processing. The tool analyzes historical production data to provide real-time recommendations, improving cheese yield and reducing waste (Dairy Reporter, 2024). Similarly, SPX Flow's SmartDry System uses AI to control moisture levels during production, ensuring consistent product quality.

Benefits of AI Integration

AI technologies offer numerous benefits to dairy farms, including increased productivity, improved animal welfare, and enhanced product quality. Predictive maintenance algorithms reduce downtime, while real-time monitoring systems help farmers respond quickly to potential health issues (Cullen et al., 2020). Additionally, AI-powered climate control systems protect cows from heat stress, further boosting milk yield.

Challenges and Risks
Despite its advantages, AI adoption in dairy farming comes with challenges. High initial investment costs, the need for technical expertise, and resistance from traditional farmers are significant barriers. Moreover, data privacy concerns and the complexity of integrating AI systems into existing operations must be addressed to ensure successful implementation.
The findings suggest that AI technologies, particularly predictive analytics and AMS, significantly improve milk yield and operational efficiency. IoT sensors enhance animal welfare by allowing real-time health monitoring. Farms using AI also reported a reduction in operational costs and better adaptability to environmental changes. However, the integration of these technologies requires high initial investments and workforce adaptation, as highlighted in interviews and case studies.
Furthermore, AI's ability to predict consumer demand provides farmers with a competitive edge, enabling them to align production with market needs. The challenges identified include the high costs of installation, data privacy concerns, and the potential displacement of traditional labor.

Conclusion And Recommendations

This article has explored the transformative impact of AI on dairy farming from various perspectives. AI enhances productivity by optimizing milk production, improves animal welfare, and automates operational processes. Additionally, it offers solutions to environmental stress factors, ensuring sustainability and economic benefits. However, the integration of these technologies also brings challenges.

In the future, the role of AI in dairy farming is expected to grow, enabling farms to gain a competitive edge in the global agricultural sector. It is essential to implement educational and technical support programs to ensure the effective use of these technologies, and to take steps to help the workforce adapt to new conditions. Leveraging the opportunities offered by AI effectively will be critical for both the sustainability of farms and the future of the agricultural sector.

The findings suggest that AI technologies, particularly predictive analytics and AMS, significantly improve milk yield and operational efficiency. IoT sensors enhance animal welfare by allowing real-time health monitoring. Farms using AI also reported a reduction in operational costs and better adaptability to environmental changes. However, the integration of these technologies requires high initial investments and workforce adaptation, as highlighted in interviews and case studies.

Furthermore, AI's ability to predict consumer demand provides farmers with a competitive edge, enabling them to align production with market needs. The challenges identified include the high costs of installation, data privacy concerns, and the potential displacement of traditional labor.

This study demonstrates the transformative impact of AI on dairy farming through production optimization, improved animal welfare, and enhanced operational efficiency. AI technologies provide solutions to environmental stressors, promoting sustainable farming practices while offering a competitive advantage in dynamic markets. However, challenges such as high costs, workforce adaptation, and data security must be addressed to fully realize AI's potential. Future research should focus on developing affordable AI solutions and retraining programs to support workers in adapting to this new technology landscape.

Recommendations and Future Directions

1. Virtual Assistants and AI Training Tools

The development of generative AI tools can provide virtual training and support to farm workers, reducing the learning curve for new technologies (Dairy Reporter, 2024). AI-based virtual assistants can also facilitate communication among multilingual teams, improving overall productivity.

2. Focus on Sustainability

AI can play a crucial role in promoting sustainability by optimizing resource use and reducing waste. For instance, AI-powered feed management systems can lower methane emissions, contributing to the environmental sustainability of dairy farms.

3. Areas for Future Research

Further research is needed to explore the potential of AI in developing new dairy products with enhanced nutritional properties. AI-driven innovation in functional dairy products can align production with emerging health and wellness trends, creating new market opportunities.

The Ecological Life of Eco-Villages

Hatice Dilaver[1*], Kamil Fatih Dilaver[2]

[1]Niğde Ömer Halisdemir University, Institute of Social Sciences, Department of Eurasian Studies, 51240, Niğde, Türkiye, haticedilaver509@gmail.com, https://orcid.org/0000-0002-4484-5297
[2]Niğde Ömer Halisdemir University, Faculty of Engineering, Electrical and Electronics Engineering, 51240, Niğde, Türkiye, kfdilaver@ohu.edu.tr, https://orcid.org/0000-0002-1825-0097

Abstract

Eco-villages are practical examples of sustainable living. These communities reduce their carbon footprint by using renewable energy and minimize environmental pollution through waste management and recycling systems. They revitalize local ecosystems by employing organic farming, permaculture, and agroforestry methods to preserve biodiversity. Socially, they foster strong social bonds and solidarity through collaborative decision-making processes and participatory governance models. Education and knowledge sharing are fundamental missions of eco-villages, and these communities serve as educational centers to disseminate sustainable living practices. Economically, they enhance resilience by promoting local production and consumption, and generate income through social enterprises. The challenges they face present opportunities for innovation and advocacy. In conclusion, eco-villages are beacons of hope in building a sustainable and harmonious world. Eco-villages represent a holistic approach to living in harmony with nature while fostering community resilience and well-being. By integrating ecological, social, and economic principles, they offer a blueprint for sustainable development that can be adapted and scaled to various contexts around the globe.One of the key aspects of eco-villages is their emphasis on self-sufficiency and local resilience. By producing their own food through organic farming and promoting local crafts and industries, they reduce dependency on external resources and contribute to the vitality of the local economy. This not only creates a more sustainable livelihood for residents but also strengthens community ties and fosters a sense of pride and identity.Furthermore, eco-villages serve as living laboratories for experimenting with alternative lifestyles and technologies. From eco-friendly building designs and renewable energy systems to innovative waste management solutions, these communities are constantly exploring new ways to minimize their environmental impact and live in harmony with the natural world.Another important aspect of eco-villages is their focus on education and knowledge sharing. Through workshops, seminars, and hands-on learning experiences, they empower residents and visitors alike to become agents of change in their own communities. By raising awareness about pressing environmental issues and offering practical solutions, they inspire individuals to adopt more sustainable practices in their daily lives.Overall, eco-villages offer a glimpse into a more sustainable and resilient future. By prioritizing the well-being of people and the planet, these communities demonstrate that another world is possible one where humans live in harmony with nature, support one another, and thrive in balance with the Earth's ecosystems.

Key Words: *Eco-village, Sustainable living, Renewable energy, Waste management, Recycling, Organic farming*

Introduction

After the Industrial Revolution, essential needs began to be mass-produced. This mode of production led to the uncontrolled transfer of all resources to factories. A random migration movement from villages to cities started to take advantage of new opportunities and accumulate wealth. This unforeseen development brought an era of wealth, abundance, and luxury for those who controlled technology. Consequently, an expensive and unsustainable lifestyle quickly became popular. The seemingly limitless use of the planet's limited resources was presented to people as a lifestyle far beyond the available means. The perception of unlimited resources eventually led to serious disruptions in sustainability within this artificial system and the inability of the natural cycle to meet the demands of the artificial system.

With industrialization, rapid urbanization caused large population movements from rural to urban areas. For the first time in 2006, the urban population surpassed the rural population, increasing the unsustainable pressure on the world. As people left their lands, new entrepreneurs seized this opportunity, employing new profit-driven agricultural techniques and driving the development of these techniques. This situation led to the emergence of hybrid seeds, produced through cross-pollination, resulting in crops that were not resistant to diseases, lacked flavor, and were deprived of nutritional value (Rose, 2014: 57).

The scientific and technological advancements of the 17th century and the Industrial Revolution fostered rational, self-interested individuals who found themselves in a competition for power and wealth. This situation reduced natural life to land and property, a vast warehouse for consumption, and a large landfill for waste. Today, many ecological and social crises are occurring, and society as a whole strives to find solutions to these crises. The eco-village movement has the potential to fill this gap.

This study evaluates eco-villages as an alternative lifestyle for a more sustainable living against the standardized and fast consumption mentality brought by globalization. In this context, the foundations of ecology and ecological thought are discussed, followed by the formation of eco-villages on these foundations and the structural characteristics of eco-village formations.

Materials and Methods

Materials

1. **Literature Sources:**
   - **Books and Articles:** Books and articles on social changes after the Industrial Revolution, ecological sustainability, and the eco-village movement.
   - **Reports and Statistics:** Reports and statistical data on rural and urban population movements, sustainability indicators, and the agricultural impacts of hybrid seeds.
   - **Case Studies:** Various examples of the eco-village movement worldwide and case studies conducted on these examples.
2. **Field Research:**
   - **Observation:** Visits to eco-villages in Turkey and around the world to observe the structural and functional characteristics of these villages.
   - **Interviews:** In-depth interviews with residents, founders, and experts of eco-villages to gather information about their operations and impact on sustainability.
   - **Surveys:** Conducting surveys among residents of eco-villages and traditional cities to measure life satisfaction, sustainable living practices, and levels of ecological awareness.
3. **Document Analysis:**
   - **Legal and Regulatory Documents:** Analysis of the founding documents, regulations, community rules, and guidelines of eco-villages.
   - **Scientific Publications:** Analysis of scientific publications on ecological thought and sustainability.

Methods

1. **Qualitative Research Methods:**
   - **Interviews:** Conducting in-depth interviews with eco-village residents, founders, and experts to provide detailed information about their operations, community dynamics, and sustainability practices.
   - **Focus Group Studies:** Holding discussions with focus groups consisting of eco-village residents about community interactions, ecological living practices, and challenges faced.
   - **Observation:** Collecting data on daily living practices and community interactions through observations made during field visits to eco-villages.
2. **Quantitative Research Methods:**
   - **Surveys:** Conducting surveys among residents of eco-villages and traditional cities to measure life satisfaction, sustainable living practices, and levels of ecological awareness. The collected data will be analyzed to evaluate the impact of eco-villages on sustainable living practices.
   - **Statistical Analysis:** Analyzing the collected survey data and statistical information to evaluate the impact of eco-villages on sustainable living practices.
3. **Literature Review:**
   - Conducting a comprehensive literature review on the topic. Theoretical frameworks will be established, and the basic principles of the eco-village movement will be detailed.
   - Analyzing the impact of social changes after the Industrial Revolution on ecological sustainability.
4. **Comparative Analysis:**
   - Comparing traditional urban life with eco-village life to highlight the advantages and disadvantages of eco-villages.
   - Comparing the impact of eco-villages on sustainable living with other alternative lifestyles.

Using these materials and methods, the impact of eco-villages on sustainable living will be thoroughly examined, and the potential of this lifestyle will be evaluated.

Theoretical Foundations Of Ecology And Ecological Thought

The concept of ecology was first introduced in 1866 by German biologist Ernst Haeckel, derived from the Greek words "oikos" (meaning house, habitat) and "logia" (meaning study or discourse). Ecology encompasses the reciprocal relationships between organisms and their surrounding world, examining in-depth the factors that form the living environment and their interactions (Güleryüz, 2013: 9).

Ecology is a science that examines how various species continue their lives in harmony with the environment, under what conditions these species meet their needs, and in what kind of environment they activate their various functions. The most distinguishing feature of this science is its holistic approach to examining the relationships between living and non-living environments (Kayır, 2003: 25). Ecology sets the boundaries of nature and redefines its agents. The meaning of life may be constructed around obeying the natural order (Şahin, 2011: 67). Nature serves as a guide, and to develop, one must listen to and carefully observe it. Seeking truth in nature as a community will open all doors (Aggarwal, 2018: 9). There are always alternatives to activities conducted within a natural order, and nature is ready to offer the necessary support as a cooperative partner when integration with it is achieved.Nature, in its own right, has a perfect balance (Fukuoka, 2018: 56). It is constantly in motion; the conditions of any given year are never exactly the same as another. Thus, rather than taking preemptive measures, it is necessary to strive to do the best with the prevailing conditions (Fukuoka, 2018: 90). Nature, like the flowers of a fruit, must be delicately preserved (Thoreau, 2018: 15). Evaluations and perspectives that consider only humans will lead to reductive and destructive outcomes. Humans are an ecological factor interacting with their living environment, and this must be remembered (Kayır, 2003: 49).

It is necessary to understand that humans have a smaller share in the web of events unfolding in nature than is often thought. When this understanding is reached, a state of universal innocence will emerge. The universe is far more than it appears, but to see this, one must actively observe the journey within the universe. Contrary to popular belief, the earth's surface is softer and more sensitive to the traces humans leave behind (Thoreau, 2018: 359-365). In essence, humans are not superior beings above nature; they are one species among many within it (Kayır, 2003: 15). It is always beneficial for humans to learn new things from nature's wisdom and flow. There is only one world, a vast field of energy. If each being or similar life forms live by thinking only of themselves, this vast field of energy will be negatively affected. One must think of the whole. Instead of destructive actions, achieving inner harmony will allow for cooperation with nature, adding to the world's richness. Life must be lived as a whole, as its meaning lies within the entirety (Findhorn Community, 2018). The secret of naturalness lies in being whole and mentally accepting this wholeness. Engaging in life activities without any distinction in a holistic perspective significantly contributes to nature's continuity.

The entire world is one family, one creation, one intelligence (Findhorn Community, 2018: 113-128). The universe comprises a whole made up of many parts, with a living structure. Being deeply aware of this situation gives people the ability to better respond to the needs of our planet and support it (Rose, 2008: 16). Today's world is both a wild and dramatic place and a ground for the awakening of new thoughts and visions. Life expresses the complex unity that takes on countless forms of endless diversity. Humans are a part of this unity (Trevelyan, 2018: 15).

The Concept Of Ecological Living

Directing desires towards the wasteful rather than the simple and plain is putting the world in a difficult situation (Fukuoka, 2018: 120). One of the fundamental assertions in Thoreau's "Walden" is that if people lived according to simple living conditions, there would be no need for modern work (Turan, 2017: 9). Every morning one wakes up is a harbinger of a simple, innocent, and joyful life like nature. A natural day passes calmly. The work one does must be heartfelt. Entertainment is not an artificial state; it is life itself. Our life is like a drama composed of many scenes (Thoreau, 2018: 101-129).

Generally, there is enough space around us, allotted by nature. Even in environments described as wild and gloomy, it is possible to encounter something of oneself. The world we live in is but a small dot in space (Thoreau, 2018: 148-152). Humanity will progress towards spiritual awareness if it abandons material ownership and personal gain planning (Fukuoka, 2018: 120). The urge to dominate nature must be overcome. Respecting nature's complex structure will bring enrichment through simplicity (Ayman, 2011: 56).

Simplicity means deliberately and willingly foregoing certain consumption habits according to our values. Learning to share resources fairly and equitably with other living beings and leading a simple life will bring health and happiness. Simplicity expresses integrating sincerely and honestly with those around us in the simplest way possible. In this case, designing by taking nature as a model is necessary. With feedback from nature, the simplest state can be found (Scott, 2011: 57-60).

The concept of simplicity is a voluntary situation, not one born of necessity. Voluntary simplicity is a path subjectively chosen by an individual. It means deciding and acting to include economic values as minimally as possible when one has the means to acquire more goods and services. Spending should be based on actual needs, not on earned income. Voluntary simplicity is not a return to the past; rather, it is a concept that shapes the future (Dudu, 2011: 10-18). When life is simplified, the complexities faced will decrease, and loneliness, poverty, and weakness will cease to be issues (Thoreau, 2018: 365).

The concept of simplicity is directly proportional to self-sufficiency. Self-sufficiency is defined as the state where the operation of something is not dependent on anything else. It brings about a balanced division of labor and an understanding of technology that can be developed and applied on a small community scale (Dudu, 2011: 19-20). The urge for contentment and simplification against the consumption appetite created by capitalism will change the consumption culture (Şahin, 2011: 66). This consciousness finds life in eco-villages.Recently, it is possible to encounter burgeoning communes in various parts of the world. They try to build their own food and social structures. Though their numbers are few, these people play a leading role in the tendency to return to nature. When one of the states of correct food, correct action, or correct awareness is realized, the others will follow (Fukuoka, 2018: 124-152). The behavior pattern of the modern consumer is determined by the preconceived notion that needs are unlimited. People have been turned into robots programmed on what, when, how, and in what way to do things (Dudu, 2011: 22-25). Ecological living experiments create an alternative to capitalism. The ecological experience should be perceived not only as something that feeds the consumer individual but as something that eliminates the consumer individual (Şahin, 2011: 63-66).

Today's media continues to constantly indoctrinate that the lifestyle we live is one of comfort and luxury. The media impose upon individuals the idea that all existing resources in the world belong to humans, who are the ultimate lords of the universe. To create new consumption habits, the perception that the economy will collapse unless existing products are consumed is created (Güleryüz, 2013: 17). This consumption and waste situation threatens the continuity of living spaces, prompting the need for ecological alternatives.

The Eco-Village Movement As A Sustainable Living Model

The fundamental feature of eco-villages is the fusion of urban and rural life. These settlements represent the post-modern settlement pattern of the age of communication and information (Ayman, 2011: 33). The International Eco-Village Network (GEN) defines an eco-village as a rural or urban settlement where social, economic, and environmental sustainability is simultaneously implemented. Thus, a social structure can be established that meets the needs of modern life, preserves natural resources, and maintains local culture and social values (GEN, 2017: 20).

An eco-village is defined as a rural or urban settlement designed by the people living in it, where ecological balance and life satisfaction are simultaneously achieved. The establishment of eco-villages is based on three main elements: ecological, social, and economic sustainability. The primary foundation of ecological sustainability is the goal of restoring a harmonious relationship between humans and nature, leading to the development of a balance-oriented ecological consciousness (Kasper, 2008: 14-17).

Historical Development Of The Eco-Village Movement

The modern eco-village movement emerged in the 1970s and 1980s, influenced by various social and environmental movements. The term "eco-village" itself was coined in the 1990s. The rise of the movement can be attributed to increasing awareness of environmental degradation, the failures of traditional urbanization and industrialization models, and a growing interest in sustainable living practices.

The eco-village movement has been influenced by various philosophical and practical frameworks, including permaculture, bioregionalism, and the principles of deep ecology. These frameworks emphasize living in harmony with the natural environment, reducing ecological footprints, and creating self-sustaining communities.The development of the eco-village movement has been marked by the establishment of various intentional communities around the world. These communities often serve as living laboratories for sustainable practices, experimenting with alternative energy sources, organic agriculture, and communal living arrangements.

Structural Characteristics Of Eco-Villages

Eco-villages are characterized by several structural features that distinguish them from conventional settlements. These features include:

1. **Ecological Design and Architecture:** Eco-villages prioritize sustainable design principles, including energy-efficient buildings, the use of local and natural materials, and designs that minimize environmental impact.
2. **Renewable Energy Sources:** Many eco-villages utilize renewable energy sources such as solar, wind, and hydro power. This reduces dependence on fossil fuels and decreases greenhouse gas emissions.
3. **Organic Agriculture and Food Production:** Eco-villages often practice organic agriculture, emphasizing biodiversity, soil health, and sustainable farming practices. This ensures a steady supply of nutritious food while maintaining ecological balance.
4. **Water Conservation and Management:** Sustainable water management practices are crucial in eco-villages. This includes rainwater harvesting, greywater recycling, and the use of composting toilets.
5. **Community Governance and Decision-Making:** Eco-villages typically employ participatory and inclusive governance structures. Decision-making processes often involve consensus or other democratic methods to ensure that all community members have a voice.

6. **Economic Sustainability:** Eco-villages strive for economic self-sufficiency through various means, such as local production and trade, cooperative businesses, and alternative economic systems like time banking.
7. **Education and Outreach:** Many eco-villages engage in educational activities, offering workshops, courses, and tours to spread knowledge about sustainable living practices. They often serve as models and inspiration for broader societal change.

Structural Characteristics Of Eco-Villages Shaped On The Basis Of Ecological Living

The concept and implementation of eco-villages are quite new. Eco-villages have been established in various parts of the world, and there is an effort to organize them globally. Eco-villages are the product of an idea that will contribute in the long term rather than the short term. This tendency can be found both within cities and as an escape from urban areas (Topbaş, 2010: 5).Eco-villages represent a way of life where human activities are carried out in harmony with and respect for nature. In 1994, the Global Ecovillage Network (GEN) was established to create a connection among all eco-villages worldwide, to develop new projects, and to enhance existing ones (İkinci, 2011: 61). GEN defines itself as a global confederation of individuals and organizations dedicated to sustainable living by coming together to share ideas, exchange technologies, and produce cultural and educational guides, programs, and newsletters, aiming to create a sustainable evolution globally. GEN strongly supports new eco-village initiatives (Dawson, 2012: 26-27), providing a global interaction platform for eco-villages.

Three regional centers have been established for GEN: GEN Europe and Africa, the Ecovillage Network of the Americas, and GEN Oceania and Asia. The primary goal of GEN is not to increase the number of eco-villages but to raise global awareness of the eco-village concept (Litfin, 2017: 26-29, 62). The core axis of GEN's development program consists of the following three points (Topbaş, 2010: 4):

1. Preparing programs to offer alternative solutions that reduce negative impacts for a higher quality of life, cleaner society, and environment.
2. Developing technologies and enterprises for sustainable projects.
3. Developing an international network for the exchange of knowledge and skills.

Six fundamental principles for eco-villages emerged from the joint efforts of groups connected to the eco-village network in 1999-2000 (Topbaş, 2010: 2-4):

- **Autonomy:** Refers to independence in economic and energy matters.
- **Coexistence:** The ability of people to live together harmoniously in a peaceful relationship network, accepting each other's differences.
- **Openness:** Being open to local residents and groups or individuals visiting the eco-village.
- **Respect:** Primarily signifies respect for nature but also includes showing an exemplary life without forcing one's thoughts and ideas on others. It involves being respectful of oneself, being inclined to reach consensus during decision-making, having the capacity to listen to other views, and possessing sincere and warm dialogue skills. Respect also plays a significant role in developing suitable models and encouraging creativity within the community.
- **Solidarity:** Involves helping those who take on new or difficult tasks, fostering active solidarity that serves as an incentive in the challenging process of achieving a good life.
- **Freedom of Personal Belief:** Recognizes that belief is personal and an experience that cannot be fully explained. Different feelings about the world should be freely lived.

Eco-villages differ from existing villages in ecological, cultural, social, and economic aspects (Topbaş, 2010: 3-4):

1. **Ecologically:** Existing villages do not have the same level of environmental sensitivity as eco-villages, being quite behind in this regard.
2. **Culturally:** Eco-villages are better at producing and developing common values and establishing good relationships among people in friendship.
3. **Socially:** Eco-villages are better in terms of sharing and solidarity.
4. **Economically:** Integration with the local economy is less common in existing villages.

Integration with the local economy is less common in existing villages. Eco-villages must demonstrate sustainable development continuously. The members of these settlements organize various activities to create or develop the village's economy. Examples of sustainable eco-village activities include tourist visits to the area, marketing ecological agricultural products, and offering various training on nature conservation and ecological living (İkinci, 2011: 63). The accumulation of carbon dioxide in the atmosphere creates human-induced global warming due to fossil fuel use, negatively affecting the health of the entire world (Featherstone, 2018: 293-294).Overpopulation in cities leads to insecure and dangerous environments. The excessive noise of the city resembles humanity's cries (Le Guin, 2019: 10-18). An ecological community requires respect for every living being in our neighborhood. The community's needs are met internally, minimizing dependence on the outside.

Turkey has exceeded its biological capacity by 59%. However, there is rapidly increasing awareness of this issue in Turkey. Ecological life-focused projects are being produced in Turkey. In 2003, the Buğday Association for Supporting Ecological Living initiated the TaTuTa (Agriculture, Tourism, Exchange) project. The goal of this project is to develop places in rural areas that grow ecological products, are nature-friendly, and are sustainable (İkinci, 2011: 64-65). Our actions liberate our thoughts (Fombelle, 2018: 61).Some organizations have emerged in Turkey to resolve the difficulties and dilemmas in eco-villages. These organizations include EKİLAT (Eco-villages Communication Network), Buğday: Association for Supporting Ecological Living, and EKOYER (Eco Settlements Network). Individuals who wish can stay in eco-villages individually or as a group. During the time spent there, visitors contribute to the continuity and development of these formations both materially and spiritually (Asımgil, 2017: 102-104).

Through the TaTuTa Project of the Buğday Association for Supporting Ecological Living, communication between groups or individuals living an ecological life is strengthened. Places are created that set an example for the healthy use of vital resources for rural populations by moving with natural cycles. Urban people are introduced to the ecological way of life. Ecological methods, experiences, and knowledge exchanges are made first-hand. Contributions are made to the protection and sustainability of soil, air, water, climate, and biodiversity (Aydın, 2012: 44). The organizations involved in this project have pioneered creating a life that does not harm the environment by utilizing the knowledge, skills, and experiences of local people and visitors (Scott, 2011: 59).Eco-villages are seen as seeds that will secure the future on the axis of sustainability (Litfin, 2017: 27). Sustainability must be conceived as a life model, primarily in food, shelter, health, education, and security (Scott, 2011: 58). To achieve sustainability and self-sufficiency, ecological, economic, and social problems must be resolved. The individuals living in the established settlement must adapt to the local environment. In this context, a settlement model planned on the local, physical, economic, environmental, social, and cultural characteristics of a place will greatly contribute to the planned settlement. Local data is collected from the surrounding area, thus creating a natural living space in harmony with the region. Eco-villages must approach with awareness of local knowledge, traditional techniques, and practices. As a result, since each region's characteristics will differ according to its cultural structure, unique eco-villages characterized differently in other regions will emerge (Asımgil, 2017: 107-108).

To end crises, we must think with universal values. We must act in proportion to local dynamics and resources. The knowledge and experience of all past cultures worldwide present an opportunity for newly created communities. Ecological settlements established in rural areas will only succeed if they involve the local population in their efforts. Much can be learned from traditional structures (Ayman, 2011: 55). The most crucial factor enabling the mental and practical transformation of sustainable living is utilizing or receiving support from cultural values and the local population in the established structure (Scott, 2011: 59).

The reason for adopting the village model in ecological settlements is the close relationship between people and resources. In the village model, farmers can more easily recognize and identify everyone from those who grind wheat to those who pollute the river. Practices that will directly affect themselves, their relatives, and neighbors result in greater care. As in any village, bad behaviors disrupt both ecological and social balance. However, social power can play a more effective role in small settlements. The goal of eco-villages is not to return entirely to the past village life but to choose the village-type settlement as the most effective way to establish livable and sustainable economies (Litfin, 2017: 112). The most productive settlement type for starting ecological life is villages, which should eventually replace the neighborhoods of noble people and become the masters of art (Thoreau, 2018: 125-126).

Excessive wealth will only feed the sense of excessive consumption. The economy is subject to an educational experience progressing with eco-villages. Eco-villages serve as laboratories for the best sustainable economy. Innovative financial transactions, investment preferences, and even new currencies can be found. The roots of ecology and economy are the same, both derived from the Greek word "oikos." Ecology involves the family-based management of natural resources without exploitation, while economy involves managing its financial criteria and resources. Therefore, resource creation, production, consumption, and waste processes must be aligned with the life cycle. For this to happen, the economic system must change. An economy based on exploitative cheap trade at the expense of other living beings and ecosystems should not be accepted.Most eco-villagers can live comfortably below the poverty line in wealthy countries. The secret is simplicity, self-sufficiency, and sharing. Every rural eco-village produces almost all its food. Urban eco-villages obtain necessary products through their relations with rural eco-villages.

Conclusion

Eco-villages represent a progressive movement toward sustainable living that emphasizes harmony with nature and community self-sufficiency. These settlements embody principles such as autonomy, coexistence, openness, respect, solidarity, and freedom of personal belief, distinguishing them from traditional villages in ecological, cultural, social, and economic aspects. Through the support and initiatives of organizations like the Global

Ecovillage Network (GEN) and local projects such as Turkey's TaTuTa, eco-villages demonstrate the practical application of sustainable development principles.

The primary goal of eco-villages is not merely to increase their numbers but to raise global awareness and promote a lifestyle that reduces environmental impact. By integrating local knowledge, traditional techniques, and modern sustainable practices, eco-villages can create a model of living those balances ecological integrity, social well-being, and economic viability. These communities function as living laboratories for sustainable economies, exploring innovative financial systems and fostering a culture of simplicity, self-sufficiency, and sharing.

In addressing global challenges such as overpopulation, resource depletion, and climate change, eco-villages offer a viable alternative to the exploitative economic models that dominate contemporary society. They provide a blueprint for creating resilient, self-sustaining communities that prioritize ecological stewardship and social cohesion. As such, eco-villages are seeds of a sustainable future, demonstrating that a harmonious and respectful coexistence with nature is not only possible but essential for the well-being of the planet and its inhabitants. Eco-villages also contribute significantly to biodiversity conservation and the revitalization of local ecosystems. By implementing organic farming, permaculture, and agroforestry, these communities enhance soil health, increase carbon sequestration, and support diverse flora and fauna. This holistic approach to land use contrasts sharply with industrial agricultural practices that often lead to soil degradation, water pollution, and loss of biodiversity.Furthermore, eco-villages promote social innovation and community resilience. They foster strong social bonds through collaborative decision-making processes and shared responsibilities. This sense of community can enhance individual well-being, reduce social isolation, and create a supportive environment for all members. The participatory governance models adopted by eco-villages, often based on consensus or sociocracy, ensure that all voices are heard, and collective wisdom is harnessed to address challenges and make decisions.Education and knowledge sharing are central to the mission of eco-villages. They often serve as educational centers, offering workshops, internships, and volunteer opportunities to spread sustainable living practices. By partnering with schools, universities, and non-governmental organizations, eco-villages extend their impact beyond their immediate boundaries, inspiring broader societal change.Economically, eco-villages are laboratories for sustainable livelihoods. They encourage local production and consumption, reducing dependence on external markets and fostering economic resilience. Many eco-villages operate social enterprises, such as organic farms, artisanal crafts, and eco-tourism, which provide income while aligning with ecological and social values.The challenges faced by eco-villages, such as securing funding, navigating legal frameworks, and integrating with the wider society, are significant. However, these challenges are also opportunities for innovation and advocacy. By demonstrating successful models of sustainable living, eco-villages can influence policy, inspire legislative changes, and encourage the mainstream adoption of sustainable practices.

In conclusion, eco-villages are more than just ecological experiments; they are beacons of hope for a sustainable future. They illustrate that it is possible to live in a way that respects and enhances the natural world while fostering vibrant, equitable, and resilient communities. As we face the pressing environmental and social challenges of our time, the lessons and practices emerging from eco-villages offer valuable guidance for building a more sustainable and harmonious world.

Comparison of Technical Efficiency between Boro Rice and Maize Production in the Northern Region of Bangladesh

Akbar Hossain Tusher[1], Faysal Ahmed Himel[1], Babor Ahmad[1], Mostafa Monir[1], Md. Anowar Hossain[1], Md. Rakibul Hasan[1], Shahiduzzaman Selim[1]

[1]Department of Economics, Dhaka International University, Bangladesh

Abstract

This study examines the scale and technical efficiency of Boro rice and maize cultivation in northern Bangladesh, focusing on the Dinajpur and Lalmonirhat districts. Utilizing stochastic production frontier analysis, the research assesses the key factors affecting production efficiency and resource utilization among smallholder farmers. The findings indicate that maize producers demonstrate higher technical efficiency compared to Boro rice farmers, with efficiency levels for maize often surpassing 90%. Fertilizer use is crucial in enhancing maize productivity, while labor plays a significant role in the cultivation of both crops. Additionally, younger and more experienced farmers exhibit higher efficiency, highlighting the importance of human capital in agricultural productivity. Despite these improvements, challenges remain, such as limited access to extension services, credit facilities, and quality inputs, which hinder the potential of both maize and Boro rice farmers. The study also identifies inefficiencies among Boro rice farmers, attributed to suboptimal resource utilization and a lack of adoption of productivity-boosting practices. For maize, the complementarity between labor and fertilizer use suggests opportunities for integrated resource management strategies to boost output. The findings align with previous research, emphasizing that efficiency gains can be achieved through targeted interventions, including improved access to timely services, training programs, and financial support. The insights provided are valuable for policymakers, extension agents, and stakeholders working to promote sustainable agricultural practices and improve productivity in Bangladesh's smallholder farming systems.

Growth Performance of Broiler Chicken (*Gallus gallus domesticus*) in Response to Cinnamon Powder as Feed Additives

Ramil Jr. Entana[1]

[1]Department of Animal Science, College of Agriculture, Mindanao State University-Buug, Buug, Zamboanga Sibugay 7009, Philippines, ramiljr.entana@msubuug.edu.ph, https://orcid.org/0009-0007-7581-7639

Abstract

One hundred-twenty (120) heads of day-old Cornish-cross broiler chicks were used in the study, which employed a Completely Randomized Design (CRD). The purpose of the study was to evaluate the growth performance of broiler chickens in response to cinnamon powder supplementation. There were four treatments which were replicated three times having 10 broiler chicks per replication. Treatment 1 (T1) had 50g cinnamon powder as feed additives, Treatment (T2) with 75g cinnamon powder, Treatment 3 (T3) with 100g cinnamon powder and the Control group (T0) had a basal diet of commercial feeds with no feed additives. The study investigated the growth parameters of broiler chickens for 30 days, after the termination of the study the chickens were slaughtered and weighed to determine the carcass performance of the chickens. After the period of experimentation broiler chickens from Treatment 3 (T3) with 100 grams of cinnamon powder obtained the highest live weight compared to other treatments. Also, it was observed in the study that broiler chickens from Treatment 3 (T3) had the highest return on investment with 64%.

Abstract

Food-borne parasitic zoonoses (FBPZs), caused by the consumption of food or water contaminated by infectious parasites, pose significant public health concerns in countries like the Philippines, where animal source foods are integral to diet and these diseases remain endemic. As they are often transmitted through food-handling practices, vendors have an important role in their prevention. With this, the study assessed the level of knowledge of the fish and meat vendors in Bay Public Market towards FBPZs and their hygiene practices. A descriptive cross-sectional study was conducted on 37 participants through the completion of a survey questionnaire on socio-demographic profile, knowledge of FBPZs, and self-reported hygiene practices. Data analyses were done through descriptive statistics, Pearson correlation, and Spearman correlation test. Results revealed that the majority (65.7%) have a good level of knowledge on FBPZs. Vendors reported that they always (median = 5) adhere to good hygiene practices and rarely (median = 2) to poor hygiene practices. Furthermore, a significant but moderate inverse correlation (r=-0.430, p=0.008) was found between vendors' age and knowledge on FBPZs. Hence, there is a need for targeted interventions to enhance understanding of FBPZs, particularly among older vendors, and to further improve hygiene practices to mitigate risk of transmission of these diseases.

Key Words: *Food-borne parasitic zoonoses, knowledge, hygiene practices, fish and meat vendors, animal source food, food-borne diseases*

Introduction

Access to an adequate supply of safe and nutritious food is essential for a sustainable life and good health. Despite this fact, many public health agencies do not completely understand the global importance of food safety. Food-borne disease (FBD) is becoming more common based on epidemiological surveillance (Käferstein & Abdussalam, 1999). According to WHO, 600 million people are reportedly becoming ill after consuming contaminated food, while 420,000 die every year. Infants, young children, the elderly, and people who are ill are particularly affected by the vicious cycle of disease and malnutrition that this creates (WHO, 2022).

Some food-borne illnesses are considered to be zoonotic. Zoonotic diseases are infectious diseases that may be transmitted from animals to humans. Unsafe farming methods, poor food handling, and contamination during production or distribution are a few of the key pathways for zoonotic illnesses to enter the food we consume (Liou, 2021). Therefore, food is an important vector for many zoonotic pathogens. However, it is important to note that food from animal sources increases the human health risk of food-borne zoonoses (Carrique-Mas & Bryant, 2013). This is because vertebrate animals are natural reservoirs for many zoonotic diseases (Leahy et al., 2022).

Food-borne zoonoses (FBZs) can be classified into three: parasites, bacteria, and viruses. Food-borne parasitic zoonoses (FBPZs) have afflicted human lives, many of which are caused by helminths. Schistosomiasis, cysticercosis, trematodiasis, and echinococcosis are prominent zoonotic parasite illnesses, and some of them have high mortality rates or long-term consequences including cancer and neurological abnormalities (Wielinga & Schlundt, 2012). An estimated 23.2 million cases and 45,927 fatalities every year have been reportedly caused by food-borne parasitic diseases (Torgerson et al., 2015).

In the Philippines, several FBPZs were documented in a study by Eduardo in 1991 and 2001. These include echinostomiasis, artyfechinostomosis, fascioliasis, heterophyiasis, carneophallosis, clonorchiasis, paragonimiasis, taeniasis, echinococcosis/ hydatidosis, diphyllobothriosis/spirometrosis and sparganosis, intestinal capillariasis, gnathostomiasis, angiostrongylosis, toxoplasmosis and sarcosporidiosis. While some of the FBPZs are now rarely observed, others remain significant concerns for public health. Many of these diseases are endemic in some regions of the Philippines, particularly where there is a tradition of eating raw or undercooked fish, snails, crustaceans, and meat (Eduardo, 1991, 2001).

A wide range of foods typically come together in markets. In Asia, public wet markets are regarded as traditional food providers and are key suppliers of everyday goods including fresh meats and produce (Carmen et al., 2020). As a source of food for human consumption, food safety is of great importance in public markets to protect consumers as well as vendors from foodborne diseases. Vendors, in particular, have significant roles in the etiology of FBZs outbreaks (Grwambi, 2020). The manner in which food is prepared and handled by vendors can cause cross-contamination and encourage the spread of FBZs. Several studies have shown how a lack of knowledge among vendors of animal-source food in low- and middle-income countries causes unsafe practices to persist (Leahy et al., 2022). Hence, understanding and improving the vendor's awareness has been a focus to address this issue. Furthermore, according to Murrell (2013), with a lack of knowledge about infection and proper hygiene, poor animal husbandry, and improper storage and disposal of human and animal waste products, the risk of people for FBPZs is at highest. This emphasizes the importance of determining vendor knowledge regarding FBPZs, especially those that handle animal source food, and their hygiene practices in their work settings. Not only are they vulnerable to the disease because of the nature of the foods that they market, but also because of their level of knowledge about these FBPZs and their compliance with hygiene practices.

This study aimed to assess the level of knowledge on FBPZs and the hygiene practices of the fish and meat vendors in the public market of Bay, Laguna. Specifically, it described the socio-demographic profile and hygienic practices of the fish and meat vendors. It also measured the level of knowledge of the fish and meat vendors about FBPZs and determined their source of knowledge about food safety. Furthermore, this study determined the relationship among the knowledge of FBPZs, hygienic practices, and socio-demographic profile of the fish and meat vendors. The findings of this study provide local data on the level of knowledge of the fish and meat vendors in the public market of Bay, Laguna regarding FBPZs and their compliance to hygiene practices. These are useful for local government units (LGUs), especially of Bay, Laguna, for developing programs, and policies, as well as for planning interventions towards improving the knowledge on FBPZs and scaling up the food safety practices of public market vendors. Such interventions are crucial to lessen the risk of consumers and vendors against food-borne diseases (FBDs) such as parasitic zoonoses and strengthen the market's competitiveness in meeting global food safety standards.

Materials and Methods

Locale of the Study

The study was conducted at the Pamilihang Bayan ng Bay or Bay Public Market, which is a central public market and biggest market of Bay located in Barangay Dila along Jose Rizal Avenue, Bay, Laguna. Bay Public Market is situated near the key municipal institutions, including the Municipal Hall and San Agustin Parish Church, public and private educational facilities, and foodservice and other business establishments. Furthermore, the public market is highly accessible to most barangays of Bay and nearby food establishments as well as nearby municipalities, making it the major source of daily food for the locals residing in the municipality and even locals from other municipalities.

Research Design

The research design selected to address the objectives of this study was a descriptive cross-sectional. A cross-sectional study design involves gathering of data on the presence or level of one or more variables of interest as they exist in a defined population at one particular time (Aggarwal & Ranganathan, 2019). Similar studies by Alemayehu and colleagues (2021) and Otuh et al. (2023) that were conducted in the past utilized the cross-sectional method of study to assess the knowledge and practice, along with other variables, of different populations of interest on FBZs. Furthermore, cross-sectional study is relatively simple and inexpensive to carry out (Aggarwal & Ranganathan, 2019). Specifically, a descriptive cross-sectional study was selected as it can provide data for describing the status of a variable or relationships among variables at a fixed point in time (Ihudiebube-Splendor & Chikeme, 2020). This study will not only describe the socio-demographic profile, the level of knowledge on FBPZs, and the hygienic practices of the vendors but also determine the relationship among these variables. Therefore, this design was found appropriate for the aims of this study.

Study Population

The study focused on the fish and meat vendors of Bay Public Market. A list of the fish and meat business lines operating with business permit and license in the Bay Public Market was obtained from the Business Permit and License Office of the Municipality of Bay. From the list, the researcher ensured that all the stalls included in the lists still existed or operated prior to the data collection period. Fish and meat stalls that were no longer operating were excluded from the list. The total population of interest consists of vendors from the 39 stalls identified as actively selling fish and meat in the Bay Public Market based from the municipal list and actual checking. All vendors from the stalls selling fish and meats were the target participants of this study. Given the small population of the study, a complete enumeration survey was conducted. A complete enumeration method or a census is a non-

sampling method that involves studying the entire population of the study (Arnab, 2017). A census is free from sampling error, providing a true measure of the population. However, it can be difficult to enumerate all units of the population within a given time, and it can cost more and may entail more time to collect and analyze data. That is why when the number of survey units in a population is so large, the units are sampled which is more practical. However, in this study, the population is not very large for a whole population survey to be impossible to carry out. For very small populations (50 or less), one needs almost the entire population to achieve accuracy (Morris, n.d.). Considering that the population in this study was only 39, a whole population survey was done.

The study intended to conduct a whole population approach, aiming to survey every stall. However, due to practical constraints, such as closures during the data collection period, 2 stalls were not included in the survey. Hence, vendors from the 37 stalls were the final participants of this study.

Data Collection

Questionnaire Design

A self-administered survey questionnaire intended to measure the knowledge towards FBPZs and the hygiene practices of the fish and meat vendors was developed as there are no questionnaires that can be adapted from other studies for this topic and the target population. The questions and the number of questions in the survey questionnaire were revised accordingly based on the comments of the panel of experts and the pre-testing carried out. The resulting 29-item questionnaire was categorized under three (3) parts. The questionnaire that was developed was also translated in the local language, which is Tagalog, to suit the characteristics of the target population and ensure that they understood the questions.

The first part of the questionnaire covers the socio-demographic characteristics of the respondents, containing basic information on the gender, age, level of education, the number of years that they have worked as vendors, their merchandise, and whether they have attended a food safety seminar.

The second part focused on the knowledge of the vendors on FBPZs, which was further subdivided into two parts. The first part contains a question on whether the vendors knew about the FBPZs. This question aims to determine the awareness of the vendors on FBPZs. To determine the source of knowledge of the vendors about FBPZs, a question on where they have heard or read about it was included. Furthermore, the respondents were asked to provide examples of FBPZs that they have read, heard, or read to confirm that they really are aware or have knowledge about the FBPZs. The second part of part two (2) also included 10 statements revolving around concepts of FBPZs with three possible responses – true, false, and do not know. The statements were developed from the report of the Food and Agriculture Organization (FAO) and World Health Organization (WHO) about the current status of knowledge on parasites and their public health impact (FAO & WHO, 2014). Furthermore, statements were also generated based on the fact sheets on different FBPZs published by the Food and Agriculture Organization (FAO), World Health Organization (WHO), and World Organisation for Animal Health (WOAH) (2021). These resources contain necessary information about the transmission and risk factors, signs and symptoms, detection and diagnosis, treatment, and control and prevention of various FBPZs. For this 10-item part, each item that was answered correctly by the respondents bears 1 point or score. Incorrect answers, including "do not know" responses were given a 0 point.

The third section covers the hygienic practices of the vendors, which contains 10 statements with five categorical answers (1-never, 2-rarely, 3-sometimes, 4-often and 5-always) to measure the extent of application of the stated practices. The statements for this section were developed from the Codex Alimentarius book of the FAO and WHO (2022), which includes the Good Hygiene Practices (GHP) that the food business operators (FBOs) must understand and follow to oversee food safety and suitability.

Validity and Reliability

To ensure validity, the questionnaire was sent to six (6) food and nutrition experts. The panel of experts was asked whether each question or statement were valid or not. The experts were also asked to provide comments to further improve the survey questionnaire. The inter-rater agreement was analyzed through Cohen's Kappa (McHugh, 2012). The survey consisted of 29 items and the computed value for Cohen's Kappa was 0.9655, which means that there is an almost perfect agreement among the answers of the expert, ensuring that the survey questionnaire was valid.

To further assess the applicability of the survey tool to the intended population, a pre-testing was carried out among fish and meat vendors in small markets and roadside stalls around Los Baños and Bay, Laguna. A total of 18 respondents took part in the pre-testing. The administered questionnaires during the pre-testing were the revised version based on the comments and suggestions of the panel of experts.

To measure the reliability, the internal consistency of the survey tool was determined using Cronbach's alpha, wherein a value of at least 0.7 guaranteed the consistency of the questionnaire (George & Mallery, 2003). In the survey questionnaire, the knowledge (part 2B) and hygiene practice (part 3) parts were subjected to Cronbach's alpha. The part 2B, which contains 10 items of true or false statements, had a computed Cronbach's alpha of 0.7414, which means that it has an acceptable internal consistency. The part 3, containing 10 items of 5-point likert

scale statements had a computed Cronbach's alpha of 0.7217, which means that it has an acceptable internal consistency as well.

Survey Conduct

The data collection was conducted from 23 May to 25 May 2024 at the wet section of Bay Public Market. The informed consent form and questionnaire were handed out personally by the researcher to the literate participants. The respondents were required to read and understand the form, and then sign them before answering the questionnaire. After answering, the researcher collected the certificate of consent and survey questionnaire from the participants and immediately gave the incentive as an appreciation to the participants. For the participants who were illiterate or were unable to read the survey tool due to poor eyesight, the researcher read the consent form and questionnaire and recorded the answer as spoken by the participants. A thumbprint in the certificate of consent was obtained from the illiterate participants who agreed to participate in this study.

Data Analysis

All the data that were collected were entered in Excel spreadsheet. Statistical coding and computation were done in the RStudio Integrated Development Environment (IDE) by a statistician.

The data were presented using descriptive statistics through frequency and percentage distribution. This analysis was used to describe the socio-demographic profile, knowledge on FBPZs, the distribution of correct and incorrect answers in the true or false statements, and the level of knowledge on FBPZs.

The level of knowledge on FBPZs was determined through the percentage of correct answers by each respondent in the part 2B of the survey questionnaire. Each statement in this part that was correctly answered by the respondents was given 1 point. The maximum score for this section was, therefore, 10 points. The cumulative score for this section was then converted to 100%, wherein interpretations were made. A score of below 70% was considered a poor level of knowledge while a score of 70% and above was considered a good level of knowledge, which was adapted from a related study on the food safety knowledge, attitude, and hygiene practices of food handlers (Tuglo et al., 2021).

For describing the hygienic practices of the vendors, the median score or answer for each statement was determined. To analyze the correlation between variables, Spearman's rank correlation and Pearson correlation tests were used (Table 1). The Pearson correlation coefficient was used to evaluate the strength and direction of the relationship between two continuous variables such as age and knowledge, and years of experience and knowledge. This correlation test has been similarly used in related studies about food safety KAP of street food vendors in Bangladesh and food handlers in Ghana (Meher et al., 2022; Tuglo et al., 2021). Pearson correlation test was also employed in a study about food safety KAP of food handlers in Indonesia which uses total population (Putri & Susanna, 2021). Spearman rank correlation, on the other hand, was used to evaluate the strength and direction of association between ordinal variables such as the level of education and hygiene practices (Schober et al., 2018). This correlation test has also been used in a study about food safety KAP of street food vendors in Bangladesh (Meher et al., 2022). To determine the significance of the identified relationship between variables, a p-value < 0.05 was considered statistically significant. Nonetheless, non-significant relationships can still be discussed (Hanover College Psychology Department, n.d.). A non-significant result does not necessarily mean that there is no relationship between variables and could be due to a small effect or low statistical power of the study (Fein et al., 2022).

Table 1. Interpretation of correlation coefficient.

Correlation Coefficient	Strength of Linear Correlation/Association
0.00 - 0.20	Very Weak
0.21 - 0.40	Weak
0.41 - 0.60	Moderate
0.61 - 0.80	Strong
0.81 - 1.00	Very Strong

Results and Discussion

Socio-Demographic Profile

The fish and meat vendors surveyed in this study were mainly female vendors (64.9%) with only 35.1% were male vendors (N=37). The youngest respondent that was surveyed was 18 years old while the oldest was 75 years old. The mean age of the respondents is around 44 years old with a standard deviation of 15.33. Hence, they are commonly around 21-65 years old. The majority (56.7%) of the vendors have attained high school level of education, including high school graduates. Some had no formal education (2.7%) and had vocational education (8.1%). Most (40.5%) of the vendors had over 10 years of working experience as fish and meat vendors (Table 2).

Table 2. Percentage distribution of the respondents according to socio-demographic characteristics, public market of Bay, Laguna.

Characteristics	Indicators	Total, n (%) n = 37
Sex	Male	13 (35.1%)
	Female	24 (64.9%)
Age group	< 21 years	2 (5.4%)
	21-35 years	12 (32.4%)
	36-50 years	11 (29.7%)
	51-65 years	10 (27.0%)
	> 65 years	2 (5.4%)
Level of Education	No formal education	1 (2.7%)
	Elementary level	2 (5.4%)
	High School level	16 (43.2 %)
	High School graduate	5 (13.5%)
	College level	6 (16.2%)
	College graduate	4 (10.8%)
	Vocational level	2 (5.4%)
	Vocational graduate	1 (2.7%)
Years of Work Experience	< 1 year	3 (8.1%)
	1-5 years	10 (27.0%)
	6-10 years	9 (24.3%)
	> 10 years	15 (40.5%)

Interestingly, many of the fish and meat vendors surveyed in this study were female, which contradicts several related studies wherein male food vendors or food handlers predominate (Jianu & Golet, 2014; Kanaan et al., 2023; Siddiky et al., 2022). The fish and meat vendors were also mostly around 21 to 65 years old, which is a wider age range than the respondents, around 21 to 50 years old and 20 to 40 years old, in related studies (Jianu & Golet, 2014; Siddiky et al., 2022). This can be due to the fact that the Philippines certainly has a wide range of working age, from 15 years old to 64 years old (PSA, 2020). The majority of the fish and meat vendors in this current study attained a high school level of education, which is comparable to the studies in western Romania and Ghana, wherein most meat handlers and street food handlers have a high school or secondary level of education (Jianu & Golet, 2014; Tuglo et al., 2021). Market vendors have often been characterized by several studies with their low level of education, especially elementary and high school levels (Adzitey et al., 2018; Amaami, et al., 2016; Khanal & Poudel, 2017; Siddiky, et al., 2022). Furthermore, most fish and meat vendors in this study have over ten years of working experience as market vendors, which was longer than the related studies wherein the majority of their food handlers or vendors have less than 5 years of work experience (Jianu & Golet, 2014; Kanaan et al., 2023; Siddiky et al., 2022).

Based on Figure 1, most of the vendors sell either fish (43.2%) or pork (40.5%), while only 21.6% sell chicken and less than 3% sell beef. Some vendors (10.8%) also sell other fish and meat products including carabao meat, shellfish like mussels and shrimps. The highest percentage of vendors selling fish could be due to the fact that the municipality is near the Laguna de Bay, where freshwater fishes are available. Furthermore, there are several local ponds in the municipality that produce tilapia and catfish (Municipality of Bay, 2022).

Majority (62.2%) of the fish and meat vendors have no experience in attending any food safety seminar. Only 37.8% of the vendors have attended seminars or training on food safety (Figure 2). This proportion was higher in a study in Bangladesh wherein none of the chicken vendors had food safety training (Siddiky et al., 2022), but somehow close to the 44% of food handlers who received a food safety training course in Ghana (Tuglo et al., 2021). The disparity could be caused by factors such as accessibility of food safety programs for vendors and varying regulations in their corresponding local governments. Nevertheless, the high proportion of vendors who never had any food safety training in this study suggests the need for the market supervisor and the LGU to prioritize training initiatives, especially given the nature of their work involving food handling. Food safety training can be given to enhance knowledge, attitude, and practices of food handlers or vendors towards food safety (Siddiky et al., 2022).

Knowledge of Food-Borne Parasitic Zoonoses

The majority (n=28, 75.7%) of the fish and meat vendors reported that they do not have knowledge of what a FBPZs is and only 24.3% (n=9) claim that they know what a FBPZs is (Figure 3). Among those who claimed to know about FBPZs, only two (2) had a sense answer in relation to the question of where they heard or knew about the FBPZs. Their answers were nutrition and health, the internet, and television. The very few responses and sources provided for this question may suggest that there are limited or inaccessible sources of information on FBPZs. In fact, there is little information on food-borne parasites that is widely available from various sources,

unlike other food-borne hazards such as bacteria and chemical residues, which is why their identity and characteristics are often confused with those of bacteria and viruses (Gajadhar, 2015). Nonetheless, the cited sources of knowledge can be used by the LGU as a medium for providing information on FBPZs.

On the other hand, only two (2) responses were also given with regards to the examples of FBPZs that the vendors know or heard, which include tapeworm and worms in fish and meat. These examples are actually parasites which may cause FBPZs but not the actual disease that is being asked. This may demonstrate uncertainty and a narrow scope of knowledge concerning the various FBPZs.

Based on the assessment of the level of knowledge of the fish and meat vendors towards FBPZs, the majority (65.7%) had a score of 70% and above, hence, they have a good level of knowledge. 34.3% of the vendors, on the other hand, displayed a poor level of knowledge regarding FBPZs (Figure 4). On average, respondents had a score of 6.57 with a standard deviation of 1.91.

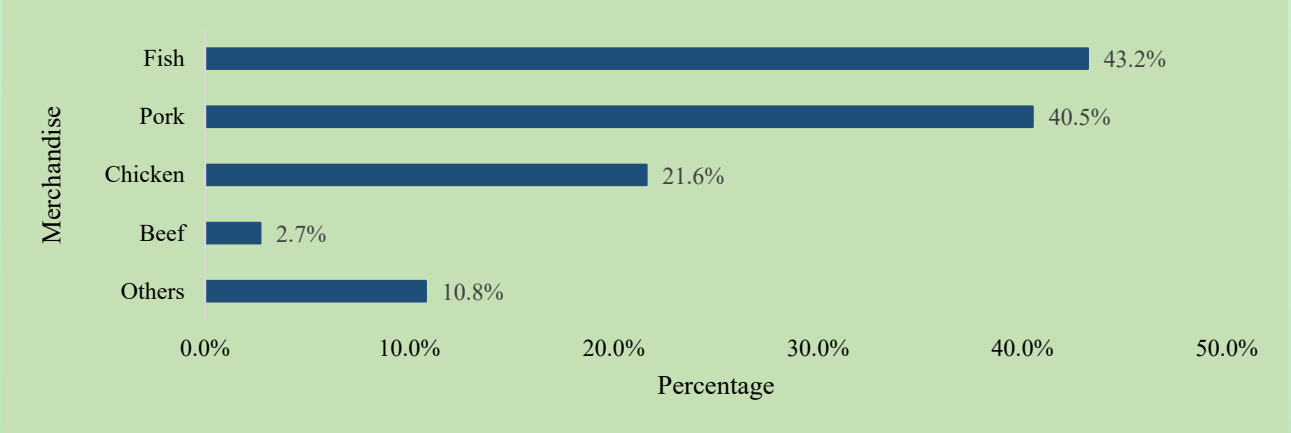

Figure 1. Percentage distribution of the fish and meat vendors' merchandise in the public market of Bay, Laguna.

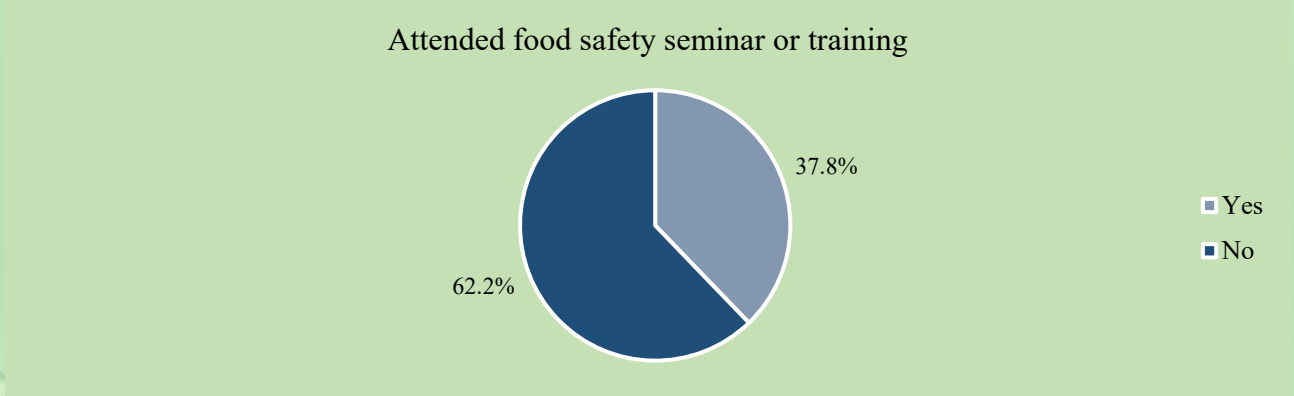

Figure 2. Percentage distribution of fish and meat vendors in the public market of Bay, Laguna who have attended food safety training or seminars.

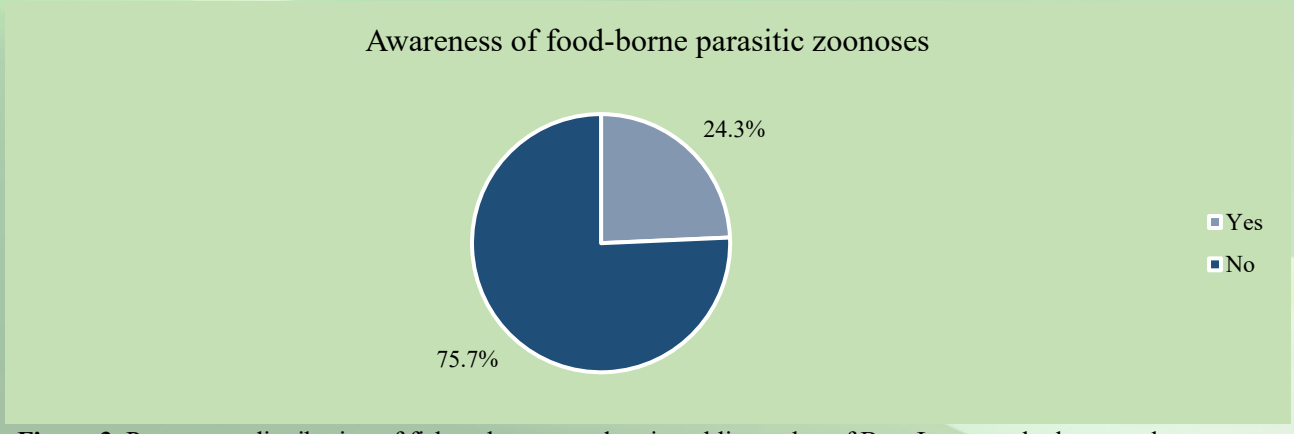

Figure 3. Percentage distribution of fish and meat vendors in public market of Bay, Laguna who knows what a food-borne parasitic zoonoses is.

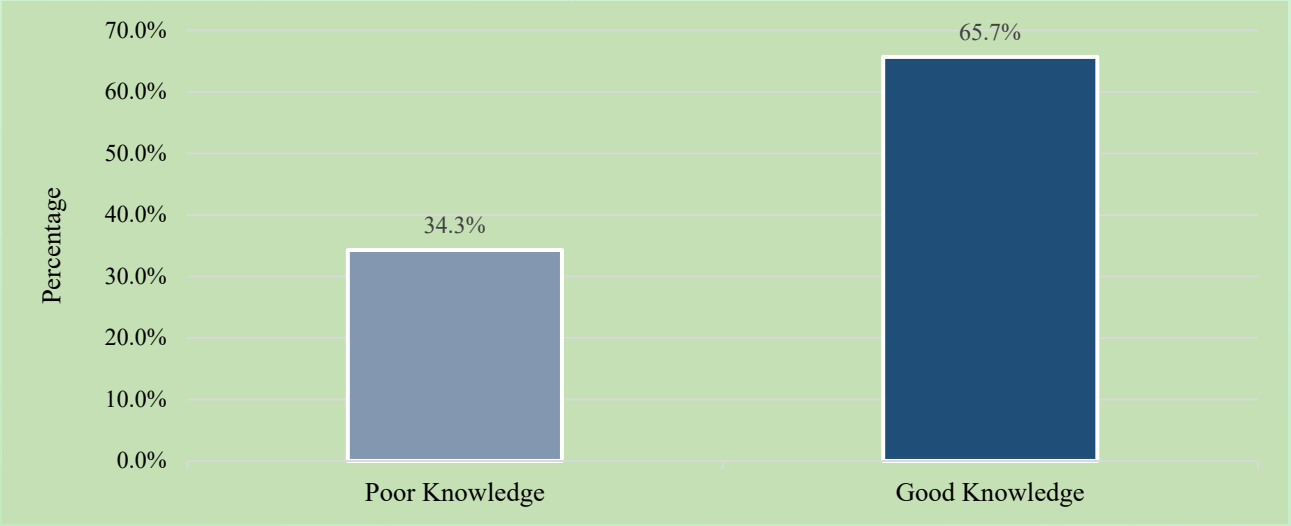

Figure 4. Level of knowledge on FBPZs of fish and meat vendors in the public market of Bay, Laguna.

Despite the low initial recognition, the surveyed fish and meat vendors may have demonstrated a good level of practical knowledge of the key concepts related to FBPZs, including transmission, associated symptoms, and preventive measures. The low proportion of vendors who were aware of what a FBPZs is, may be due to the lack of recognition of the specific term or academic terminology, which is the food-borne parasitic zoonoses. It can be that vendors possess practical knowledge about food-borne parasites but may not identify them under specific academic or technical terms. The simplicity of the examples of food-borne parasites that was also provided may be evidence for this, as tapeworms and worms are some common names. In a pilot study in Nigeria, it was found that the majority of the respondents had good knowledge of zoonoses, FBZs, preventive methods, and associated health risks, but had poor knowledge of the types of FBZs. The reason was attributed to the technical/medical nomenclature of the types of diseases in the questionnaire (Otuh et al., 2023).

The relatively good level of knowledge about FBPZs in this study may be attributed to several factors, including the years of work experience and the level of education of the fish and meat vendors. Many vendors in this study have over ten years of working experience. This extensive work experience likely gave them exposure to various aspects of food safety and the risks associated with some FBDs. According to Teferi (2022), food handlers with longer work experience may have accumulated better knowledge and skills associated with food safety. Hence, in this study, the vendors may have gained knowledge related to food safety and FBZs through observations or personal experience while working. Moreover, despite the fact that the majority of the vendors have a high school level of education, the basic education that they received may still provide them with foundational knowledge on food safety. Here in the Philippines, part of the curriculum for grade 7 or 8 is the home economics cookery course in technology and livelihood education (TLE). It includes discussion on some biological hazards or risks (DepEd, 2016b). Moreover, the health subject in grade 4 includes topics on food safety principles and food-borne diseases (DepEd, 2016a). Hence, the foundational education that the vendors have may contribute to their understanding of food safety and FBDs, despite lacking in technical terms, such as the FBPZs.

The observed good level of knowledge among vendors is encouraging from a public health perspective, as it indicates some foundational understanding of key aspects related to food safety and zoonotic diseases, especially parasitic zoonoses. Such knowledge is crucial for implementing effective hygiene practices and preventive measures to minimize the risk of foodborne illnesses, particularly FBPZs, within the market setting. A related study found that a good knowledge in the manner of transmission, prevention, and acquisition of meat-borne parasites has been directly correlated with proper food safety practices, which may lower the risks of parasitic infection (Camacho, et al., 2021). This finding of the study was inconsistent with other related studies on knowledge of food handlers specifically on zoonoses. A study on Nigeria found that the overall level of knowledge and awareness among suppliers of bushmeat was low (Ozioko et al., 2018). Similarly, a study in wet markets in Dhaka, Bangladesh found that although chicken vendors have satisfactory levels of knowledge on food safety in general, they had unsatisfactory knowledge on zoonoses and food-borne pathogens (Siddiky et al., 2022). Nonetheless, a survey in India had consistent results with this study, wherein the majority (60%) of butchers showed awareness of the commonly occurring zoonotic diseases (Prabhakar et al., 2017).

While this study found that the majority of the fish and meat vendors had a good level of knowledge regarding FBPZs, certain areas in the survey highlighted significant gaps in the understanding. Table 3 summarizes the vendors' answers about FBPZs. Most of the fish and meat vendors displayed poor knowledge on the source of some food-borne parasites as only 42.9% of them knew that lung flukes can originate from dogs and cats. Lung fluke infection, or *paragonimiasis*, is known to be endemic in eight of the 17 administrative regions in the

Philippines (WHO et al., 2020). This can originate from dogs and cats, passed on to and infect freshwater crustaceans that are foods of humans, causing diseases upon eating raw or undercooked (WHO et al., 2021). However, less than half (48.6%) of the respondents only knew the risks of FBPZs associated with consuming raw or undercooked fish and meat, highlighting a crucial gap in knowledge regarding the transmission of parasitic infections through food. This underscores the importance of knowing the source and transmission of lung fluke infection and other parasitic zoonoses among vendors for implementing appropriate preventive measures such as practicing safe food handling, towards mitigating the risks against FBPZs.

The majority of the vendors displayed poor knowledge of the proper storage temperature for preventing FBPZs, as approximately one-fourth (25.7%) knew that it is not right to store fish and meat at high temperatures to prevent diseases from food-borne parasites. This was somehow consistent with the result of a study, wherein it was found few vendors and consumers correctly indicated that protein foods, including fish and meat, should be discarded if exposed to non-refrigerated temperature for 2 hours (Nkosi & Tabit, 2021). This lack of knowledge in proper temperature handling for fish and meat could be because market settings often lack refrigeration and vendors usually display their goods on a display table and are exposed to open air (GAIN, 2020). Moreover, few (40%) of the vendors knew that directly drinking raw water or water from rivers, lakes, and springs does not prevent FBPZs, with more than half (51.4%) of the respondents displaying incorrect knowledge about this. This result of the study disagrees with studies from Iraq and Ghana, which found that most food handlers displayed good knowledge of the use of treated water for cooking and consumption (Kanaan et al., 2023; Tuglo et al., 2021). The disagreement could be because this statement was negatively structured in this study. The lack of knowledge on the correct temperature for storage and safe water to use is an issue of food safety. Hence, this emphasizes the need for training or education on safe food handling temperature and safe water consumption among the fish and meat vendors. This is important as keeping food at a safe temperature and using safe water and raw materials are included in the WHO's five keys to safer food, which, when applied, can mitigate the risk of many FBZs (GAIN, 2020).

Nonetheless, in this study, the majority of the vendors showed good knowledge on some preventive measures to minimize risk of FBPZs, as almost all (97.1%) knew about washing hands and utensils and 91.4% knew about separating raw and cooked foods. The majority also have good knowledge of the possible effects of the parasites to an individual as 88.6% knew that parasites in fish and meat can make people sick if not handled or cooked properly and that they can present several symptoms to an individual. Most (74.3%) vendors even knew food or water contaminated with pork tapeworm can cause disease in various organs.

Table 3. Distribution of the respondents' answers about knowledge on FBPZs.

Knowledge Questions	Responses, n (%)		
	Correct	Incorrect	Don't know
Meat and fish can be sources of food-borne parasitic zoonoses.	21 (60%)	1 (2.9%)	13 (37.1%)
Lung flukes that affect human lungs can originate from dogs and cats.	15 (42.9%)	4 (11.4%)	16 (45.7%)
Parasites in fish and meat can make people sick if not handled or cooked properly.	31 (88.6%)	1 (2.9%)	3 (8.6%)
Parasites present in fish and meat products can cause fever, diarrhea, nausea and vomiting, headache, body ache, and stomach pain.	31 (88.6%)	0	4 (11.4%)
Consuming raw or undercooked meat and fish does not have risks in acquiring parasitic infection.	17 (48.6%)	13 (37.1%)	5 (14.3%)
Consuming food or water contaminated with pork tapeworm may cause disease involving the brain, heart, or eyes.	26 (74.3%)	3 (8.6%)	6 (17.1%)
Storing meat and fish at high temperature helps in preventing diseases from food-borne parasites.	9 (25.7%)	23 (65.7%)	3 (8.6%)
Separating food items such as raw meat and fish from cooked items during preparation, storage, and production can lessen the risk of having diseases from food-borne parasites.	32 (91.4%)	2 (5.7%)	1 (2.9%)
Drinking water directly from rivers, lakes, and springs helps in preventing diseases from food-borne parasites.	14 (40%)	18 (51.4%)	3 (8.6%)
Washing hands and utensils used for handling fish and meat can help minimize diseases from food-borne parasites.	34 (97.1%)	0	1 (2.9%)

Self-Reported Hygiene Practices

Table 4 displays the median self-reported rating of the fish and meat vendors regarding the various statements on hygiene practices. The median scores for various practices indicate the frequency with which vendors engage in these practices.

Overall, the fish and meat vendors reported that they always (median = 5) engage in good hygiene practices but rarely (median = 2) engage in poor hygiene practices. This finding somehow agrees with the result of the study in western Romania and Ghana, wherein most of the meat handlers and street food handlers, respectively, have good hygiene practices (Jianu & Golet, 2014; Tuglo et al., 2021). Personal cleanliness during food handling including wearing clean clothes and aprons, proper hand washing, and keeping nails clean and short had a median score of 5, indicating that vendors always adhere to these practices. Similarly, the practices of using safe water for washing utensils and keeping waste containers covered received a median score of 5, which means that the fish and meat vendors always adhere to these hygiene practices. These findings were comparable to a study in Ecuador wherein most street food vendors reported that they always wear appropriate and clean clothes, keep their nails short and clean, use potable water to wash utensils and raw materials, and keep a covered waste container (Rosales et al., 2023). Studies among street food vendors and chicken vendors showed that the majority of them wash their hands before and after processing and handling foods and dressing chicken, respectively (Hossen et al., 2021; Siddiky et al., 2022). Furthermore, the vendors also reported that they never (median = 1) sneeze and cough over food nor handle food products when sick, which corresponds with the answer of most the meat handlers and street food vendors surveyed in Romania and Ecuador, respectively (Jianu & Golet, 2014; Rosales et al., 2023).

While there is strong adherence in personal hygiene and cleanliness and waste management, there are practices that hold opportunities for improvements. The fish and meat vendors reported that they rarely (median = 2) wear jewelry and carry a cellphone while selling food, and handle food products after touching money. This finding disagrees with the result of a survey in Ecuador, wherein most street food vendors claimed to never wear jewelry during their work, but agrees with their result that only few vendors always practice not handling money and food simultaneously (Rosales et al., 2023). This may be because, in many food service locations, including a public market, food workers simultaneously handle money and prepare food, hence, handwashing is often neglected between these two separate tasks (Michaels, 2002). Although the handling practices mentioned were rarely done by the fish and meat vendors in this study, these practices still need to be improved as they can promote cross-contamination. In order to improve the current hygiene practice of the fish and meat vendors, the LGU should impose safety policies and provide them with proper training on food safety and hygiene practices. Proper food safety practices are important as they may lower the risks of parasitic infection (Camacho et al., 2021).

Table 4. Median rating of the hygiene practices of the fish and meat vendors.

Good Hygiene Practices			Poor Hygiene Practices		
Statement	Median	Interpretation	Statement	Median	Interpretation
Wear clean clothes and an apron.	5	Always	Wears jewelry while selling food.	2	Rarely
Wash hands with soap and water before and after handling food products.	5	Always	Carries cellphone while selling food.	2	Rarely
Keep nails clean and short.	5	Always	Handles food products after touching money.	2	Rarely
Use safe water for washing utensils used for food products.	5	Always	Sneeze and cough over food products.	1	Never
Waste containers are kept covered.	5	Always	Handles food products when sick.	1	Never
Overall	5	Always	Overall	2	Rarely

Figure 5 depicts some observations on the hygiene practices of the fish and meat vendors in Bay Public Market. One observation was that while the vendor was wearing an apron, the clothing of the vendor, which includes sleeveless shirt, shorts, and slip-on footwear, was inappropriate for their work, especially since they handle food products. This contradicts with the vendors' reported practice of always wearing clean clothes and aprons. Figure 5 also shows the exchange of money and food products between the customer and the vendor. During this activity, it was observed that the vendor did not wash hands before and after handling food products nor after handling money, which does not agree with the reported practice. Additionally, it can be observed in figure 8 that there are buckets with drippings of animal blood on its surface, which the vendors used to store water for washing equipment and hands. Notably, there were no dedicated handwashing facilities in the public market, and only faucets were available nearby (Figure 6). This observation does not support vendors' reported practice of always washing their hands and using safe water for washing utensils. According to Chapter 5, Section 24 of the municipal ordinance

mandating the laboratory test requirements in securing health cards for food handlers and non-food handlers in different establishments in the Municipality of Bay, wash hand basins shall be installed in convenient places in all food establishments, food manufacturing establishments, and public and private markets equipped with adequate supply of water and, in proper cases, with soap, cloth or paper towels and/or hand drying equipment. The absence of proper hand washing facilities at the market indicates non-compliance with this requirement.

Figure 5. Observed hygiene practices of fish and meat vendors in Bay Public Market

Figure 5 also depicts the lack of proper waste containers, with vendors using only plastic bags and sacks for waste disposal. Disposed wastes are therefore exposed to the market environment, which does not align with vendors' reported practice of always keeping waste containers closed. Figure 9 shows an overflowing garbage container near the fish and meat section, creating unhygienic conditions that could harbor pathogens. The abovementioned ordinance specifies in chapter 7, section 32 that refuse should be separated to recyclable, non-recyclable and food materials. Section 33 states that all marketplaces shall have holding bins or refuse storage area containers maintained to be vermin and rodent proof, and that individual stalls in public and private markets shall provide garbage plastic bags for their refuse. This explains why the fish and meat stalls only have plastic bags or sacks for their wastes. However, based on figure 5, stalls seem to have only one garbage bag which may not support waste segregation as ordained by the municipality. Moreover, the overflowing garbage container in figure 6 may indicate failure to maintain a vermin or rodent proof refuse storage container.

Figure 6. Hygiene observations in Bay Public Market

Aside from the mentioned sanitary requirements, section 19 of the ordinance enumerated required proper hygiene practices for food establishment personnel in processing food, including wearing of clean working garments, hairnets, caps, and apron, especially for cooks; observing good personal hygiene; proper hand washing; not allowing food handlers with long fingernails and active skin infection to work; and avoiding wearing pieces of jewelry during work duty. While ordinance for proper hygiene practice exists, it must be implemented properly, strictly, and consistently, to improve adherence among vendors. Especially in the public market, the municipality must take proactive measures, such as placing convenient hand washing facilities and having proper refuse containers, and improving or strengthening ordinances, to facilitate good hygiene practices among vendors.

Correlation between Knowledge, Hygiene Practices, and Socio-demographic Profile

Based on the correlation analysis detailed in Table 5, only age and knowledge have a significant correlation with each other. With a Pearson correlation coefficient of -0.430 and a p-value of 0.008, age has a significantly moderate inverse linear relationship with the knowledge scores of the vendors. This indicates that younger vendors tend to have higher knowledge regarding FBPZs than older vendors. This was comparable in a study in China, wherein younger vendors and consumers, particularly of age group of 26 to 35 years old had higher levels of knowledge towards food safety (Ma et al., 2019). However, the result of this current study was inconsistent with a study in Ghana which found no significant association between age and knowledge of vendors (Tuglo et al., 2021). Nonetheless, the findings of this suggest that younger vendors may benefit from more recent educational opportunities or greater exposure to information through online channels or internet, which are critical in enhancing their understanding of food safety practices, especially on FBPZs. In fact, statistics show substantial online users among younger demographics worldwide (Petrosyan, 2024). Further, a study in Indonesia demonstrated that individuals exposed to food safety information through educational institutions and social media had 2.3 times and 1.6 times higher likelihood of possessing good food safety knowledge when dining out, respectively (Nurhidayati et al., 2022). Internet and social media even ranked 1st and 2nd, respectively, as information sources about food safety and food-borne illness during a crisis (Abdulsalam & Bakarman, 2021).

In contrast, the inverse correlation between education level and knowledge scores was very weak and not statistically significant ($r = -0.107$, $p = 0.529$). This suggests that while formal education is important, it does not solely determine the level of understanding of the vendors on FBPZs. This finding agrees with a previous study indicating that other factors such as being a registered food handler, significantly impact the food safety knowledge beyond formal education (Tuglo et al., 2021).

Regarding years of working experience, a weak positive linear relationship with knowledge scores was observed, although it did not reach statistical significance ($r = 0.301$, $p = 0.07$). This indicates that fish and meat vendors with more vending experience tend to have slightly higher levels of knowledge on FBPZs, although not statistically significant. Vendors with more years of experience may have encountered various circumstances related to food safety and parasitic zoonoses, gaining related knowledge over the years. In this study, the majority of the vendors had more than ten years of working experience and had a good level of knowledge. Food handlers with longer experience may have acquired better knowledge and skills concerning food safety in their years of working (Teferi, 2022). In fact, a study found that vendors with longer working experience have significantly higher levels of food safety knowledge (Siddiky et al., 2022). In this study, this correlation did not reach statistical significance, which could mean that other factors beyond the years as a vendor may influence the vendor's understanding of FBPZs more. Nonetheless, this suggests that fish and meat vendors, despite their years of working experience, need exposure to information on FBPZs to shape their knowledge in this matter.

Similarly, attendance to food safety seminars or training showed a very weak positive correlation with knowledge scores, but this relationship was not statistically significant ($r = 0.137$, $p = 0.418$). This indicates that participating in seminars related to food safety may not substantially increase the knowledge levels of the fish and meat vendors, especially on FBPZs. This finding aligns with the studies in Nigeria and Ghana, which did not find a significant correlation and effect of receiving food safety training with knowledge of vendors or food handlers (Madaki & Bavorova, 2019; Tuglo et al., 2021). Other factors, including the quality of food safety training received, the retention of knowledge learned from the training or seminar, the relevance of the information provided, and others, may have influenced the knowledge of the vendors.

In terms of hygiene practices, the study found a weak positive linear relationship with education level, which was not statistically significant ($r = 0.269$, $p = 0.108$). This suggests that vendors with higher education levels tend to report slightly better hygiene practices, although not statistically significant. In other studies, a significant relationship was found between these variables (Siddiky et al., 2022; Tuglo et al., 2021). A higher level of education gets better knowledge, which affects their attitude and consequently reflects in their hygiene practice (Tuglo et al., 2021). However, the result of this study suggests that hygiene practices may be influenced by other factors beyond formal education. Nonetheless, a study in Ghana revealed that food safety practices of food handlers remain an issue in many nations, regardless of their educational background (Akabanda et al., 2017).

Moreover, the vendor's years of working experience showed a weak inverse linear relationship with their reported hygiene practices, but also did not reach statistical significance (r = -0.283, p = 0.09). This suggests that vendors with more working experience tend to report lower adherence to hygiene practices, although not statistically significant. This finding was inconsistent with a study in Bangladesh, wherein chicken vendors with longer working experience exhibit significantly higher practices (Siddiky et al. 2022). In contrast, a study in Ghana found no significant association between these variables, which somehow supports this current study (Tuglo et al., 2021). The disparity could be caused by differences in study population and size. However, the inverse correlation between the variables found in this study may indicate that vendors with longer experience may have become satisfied with their practice over time, feeling less important to maintain standards of hygiene practices. Therefore, LGU must be consistent and strict in implementing hygiene standards in the market that must be followed by the vendors.

Additionally, attendance to food safety seminars and reported hygiene practices of the vendors have an inverse linear correlation that is very weak and not statistically significant (r = -0.017, p = 0.919). The correlation coefficient is very close to zero, which means that there is almost no correlation between these two variables. This disagrees with a study in Ghana which significantly found that food handlers who have undergone training courses focused on food safety are more likely to exhibit good practices in food safety and hygiene (Tuglo et al., 2021). This disparity could be a result of the difference of the food safety training received and the research population. Nonetheless, food safety training in vendors is important in improving their practice as well as their knowledge and attitudes to prevent the spread and contamination of food-borne pathogens in their working environment (Siddiky, et al., 2022). While food safety training is aimed at improving the hygienic practices of the vendors, this study found near to no correlation between these variables. Therefore, LGUs should focus on providing the fish and meat vendors with food safety training that will translate into good hygiene practices.

Lastly, knowledge scores and hygiene practices of the vendors have a positive linear relationship that is also very weak and not statistically significant (r = 0.066, p = 0.699). The correlation coefficient of these two variables is also very close to zero, indicating almost no correlation between them. This is supported by two studies in Ghana and a study in Malaysia which found no significant relationship between knowledge and hygiene performance among food vendors or handlers (Amegah et al., 2020; Sani & Siow, 2014; Tuglo et al., 2021). However, several studies also suggest that a good level of knowledge on food safety translates to good hygiene practices (Siddiky, et al., 2022; Teferi, 2022). However, the result of this study may indicate that good knowledge does not always affect hygiene practices. Therefore, regardless of the level of knowledge of the fish and meat vendors, the LGUs need to encourage them to adhere to good hygiene practices as a preventive measure against FBPZs.

Table 5. Correlation matrix of knowledge of FBPZs, hygiene practices, and socio-demographic characteristics of the fish and meat vendors of the public market of Bay, Laguna.

Variables	Knowledge of FBPZs		Hygiene Practices	
	Correlation Coefficient	*p-value*	Correlation Coefficient	*p-value*
Sex	0.114	*0.502*	-0.003	*0.985*
Age	-0.43*	*0.008*	0.008	*0.962*
Education Level	-0.107	*0.529*	0.269	*0.108*
Years of Working Experience	0.301	*0.07*	-0.283	*0.09*
Food Safety Seminar or Training	0.137	*0.418*	-0.017	*0.919*
Knowledge of FBPZs	—	—	0.066	*0.699*

*Correlation coefficient is significant (p-value < 0.05).

Conclusion

This study demonstrated that the majority of the fish and meat vendors have a good level of knowledge regarding FBPZs. However, only a few vendors were familiar with the FBPZs, which may demonstrate practical knowledge about it, but may have a lack of understanding of academic or technical terms. Furthermore, gaps in understanding about FBPZs were identified including source and transmission routes of parasitic zoonoses, safe food handling temperature, and the use of safe water for prevention. The study also revealed that the fish and meat vendors have strong adherence to hygiene practices as they always adhere to good hygiene practices and rarely to poor hygiene practices. However, practices including handling cellphones and money and wearing pieces of jewelry while handling food simultaneously can still be improved. Interestingly, this study found that younger vendors tend to have higher knowledge of FBPZs than older vendors, which may be caused by the greater exposure of younger individuals to information through the internet. This medium is even one of the sources of information on FBPZs that were cited by the vendors along with television and nutrition and health. While this provides an idea of possible

mediums to use for the dissemination of information, this also reveals the limited or inaccessible sources of information about FBPZs. This highlights the importance of widely disseminating information on FBPZs as well as proper hygiene practices through various communication channels including posters, leaflets, digital platforms, and television, ensuring that it can be accessible to all vendors, especially older vendors. This will be a collective effort of the LGU, Municipal Nutrition Action Office (MNAO), and Municipal Health Office (MHO). They could also initiate targeted educational and training programs for the fish and meat vendors, which cover identification of zoonotic parasites and their transmission routes, symptoms of FBPZs, preventive measures, and demonstrations on proper hygiene practices. The LGU should also take necessary steps to implement suitable food and personal hygiene policies or ordinances that must be followed by the market vendors to increase their adherence towards good food handling practices. These efforts aim to provide awareness towards FBPZs and prevent or mitigate risks against them.

This study is the first study to investigate fish and meat vendors' knowledge of FBPZs and their hygiene practices. Therefore, further studies still need to be conducted to fill the gaps in this area. Future research could explore a broader range of markets and vendors across different places to provide a more comprehensive understanding of their FBPZs knowledge and practices. Future research could also evaluate the effectiveness of various interventions in improving vendors' knowledge of FBPZs and hygiene practices. Lastly, for future studies adopting the methods of this research, it is recommended for the researcher to observe and rate hygiene practices rather than have them rated by the vendors themselves to reduce response bias due to social desirability. This may also provide more accurate results.

Abstract

This study is a bibliometric analysis using the keywords “egg quality”, “eggs”, “shell” and “laying hens” as part of the analysis of factors affecting egg quality using the bibliometric library R version 4.4.2 and the software VOSviewer version 1.6.20. This study considered 626 articles in the Scopus database from January 2014 to November 2024. China stood out for its publications in the field of egg quality. In terms of international collaboration, China was also the country with the most international collaborations. The study entitled “Productive performance, eggshell quality, and eggshell ultrastructure of laying hens fed diets supplemented with organic trace minerals”, initiated by Stefanello and other researchers in 2014 and published in the journal Poultry Science was the most cited. Poultry Science stands out as the journal with the most publications related to the keywords “egg quality”, “eggs”, “shell” and “laying hens”. This study also reveals that the most productive university in the field of egg quality is also a Chinese university called “Sichuan Agricultural University”. The researcher whose research and publications have attracted the most attention also comes from China and is known as “Wang J”. In this study, the most frequently used keywords are “egg quality”, “laying hens” and “laying hen”. The main trends show that research in the field of egg quality is growing steadily and provide clearer or less clearer directions for future research.

Key Words: *egg quality, eggs, shell, laying hens, Biblioshiny,VOSviewer, bibliometric analysis*

Introduction

Thanks to the various genetic manipulations and selections carried out over the last few decades on different breeds of laying hen, today a laying hen can produce an average of 300 eggs a year under ideal rearing conditions. However, to guarantee quality eggs for consumers, several factors need to be kept under control. The clarification of certain key words would undoubtedly lead to a better understanding of the themes mentioned in this study.

Egg quality is defined as the characteristics of an egg that affect consumer acceptability (Abebe et al., 2023). Egg quality refers to various standards that define both external and internal quality. Internal quality focuses on yolk height and color, albumin viscosity and Haugh unit. External quality, on the other hand, refers to shell thickness, egg width, egg height and cleanliness(Coutts & Wilson, 2007). All egg quality characteristics are affected by several factors, including hen age and genotype, nutrition, type of rearing system and time of laying (Yang et al., 2014).

According to (Belitz et al., 2009), eggs have been a human food since ancient times. They are one of nature's most perfect protein foods and contain other high-quality nutrients. Eggs are easily digested and can provide a significant proportion of the nutrients needed daily for growth and maintenance of body tissues. They are used in many ways, both in the food industry and in the home. Chicken eggs are the most important. Those of other birds (geese, ducks, plovers, gulls, quails) are of lesser importance. Thus, the term “eggs”, without prefix, generally refers to chicken eggs.

According to (Nys et al., 2011), the eggshell is a perfectly defined structure, adapted to the various functions essential for ensuring the reproduction of birds in an external environment. Its first role is to protect the egg's contents from the physical and microbial environment, the second is to allow water and gas exchange through pores to ensure the embryo's ectopic development, and the third is to supply calcium for the embryo's bone calcification. It is strong enough to provide protection against predators during embryonic development but will become fragile enough to allow the chick to hatch.

Laying hens are sexually mature female birds of the species Gallus gallusdomesticus raised for the commercial production of eggs for human consumption. Breeding hens are not included. However, laying hens still retain some of the biological characteristics of birds, such as the habit of foraging and constant movement, fine hearing, acute daytime vision, neurotic characteristics, the use of a wide range of feeds by eating gravel to crush it (Thiruvenkadan et al., 2010).

Bibliometric analysis has been described as a scientific methodology that uses computer-assisted review to examine all publications on a specific topic or field to identify primary research, subject authors and their relationships over a given time(Nicolaisen, 2010; F.-H. Liu et al., 2022). Bibliometrics is increasingly important in managing the growing number of academic publications, which often involve empirical contributions producing voluminous, fragmented and controversial research results(Aria & Cuccurullo, 2017). Compared to other scientific review techniques, bibliometrics provides highly objective and reliable analyses because it uses a "systematic, transparent and reproducible review process based on the statistical measurement of science, scientists or scientific activity" (Wallin, 2005).

Importance and objective of study

Eggs are an important food in the human diet due to their high protein content, easy preparation and wide availability on the market, as well as their low price compared to other animal protein sources such as meat and milk(Mendoza Rodríguez et al., 2016). The poultry industry is one of the fastest-growing animal industries over time. Global egg production reached 68.26 Mt in 2013, up 94.6% from 35.07 Mt in 1990 (FAOSTAT, 2015). Over the past decade, global table egg production has risen by 24.4%, taking output to 76.7 Mt in 2018, a production that is set to increase further due to strong demand for animal-derived protein (FAOSTAT, 2021).

Given its high protein content, low levels of saturated fatty acids and rich micronutrient content, particularly in vitamins and certain minerals, it is important for consumers to have quality eggs at their disposal. It is with this in mind that, for food safety reasons, the debate on egg quality has become a hot topic worldwide in recent years. In view of the high demand for eggs on the consumer market and the ensuing overproduction, a great deal of research has been undertaken to identify the factors that can affect egg quality. From these various studies, it appears that there are indeed factors that have the capacity to act by decreasing or increasing egg quality (Abrahamsson&Tauson, 1998; Safaa et al., 2008; Pérez-Bonilla et al., 2012; Jones et al., 2014; Yang et al., 2014). Numerous other studies have been carried out to investigate the factors affecting egg quality(Barbosa Filho et al., 2006; Zita et al., 2009; Tůmová&Gous, 2012; Hanusova et al., 2015; Yenice et al., 2016; Philippe et al., 2020).

From these various studies, age, type of rearing system, breed, feed, environmental conditions, temperature... are all factors that can affect egg quality. It is therefore clear that a fair amount of scientific information has been generated on egg quality. However, to the best of our knowledge, no bibliometric study exists at the present time that has exhaustively and comprehensively examined the available literature to prompt further research in this field. Bibliometric analysis is research carried out by systematically examining articles in scientific literature on a given subject and their various characteristics to understand the trends, popularity and level of progress of the subject.

This analysis usually covers large datasets and relies on data from scientific databases (Demir, Chatterjee, &Pamucar, 2024). Thus, with the ever-increasing number of research reports on egg quality in poultry production, it proved essential to provide evidence-based information through a bibliometric analysis of research productivity by authors, countries, keywords, funding agencies and collaborative networks. The results of this study would help to outline the progress of egg quality research in poultry and its development over recent decades. It would also provide organized information for researchers and poultry industry experts and help advance research in this field.

Research questions

Each study is conducted with the aim of answering a certain number of questions. Thus, to carry out this research on the bibliometric analysis of studies on the various factors affecting egg quality, various questions were asked. These included

- Q1: What is the growth trend and citation status of articles on factors affecting egg quality?
- Q2: Who are the most cited authors in the field?
- Q3: What are the most cited journals, documents, countries and organizations?
- Q4: What are the main points of research and thematic research in this field?
- Q5: What is the most cited publication?

This document is organized as follows. Chapter 2 provides a brief overview of the literature review relevant to the theme of our study. Chapter 3 describes the research methodology. Chapter 4 provides an analysis of the research results. Chapter 5 provides a general discussion of all the results, and the final chapter presents the conclusion.

Contribution of the study

The bibliometric analysis of factors affecting egg quality will provide important data on factors affecting hen egg quality in terms of the most influential authors, the most influential sources, the most influential countries, the most influential studies in the existing literature and the most influential links. Similarly, this study will help provide an overview of previous and current research and help identify future research directions on this topic. In addition, beyond the existing literature, this study will stimulate a much deeper discussion that will lead to a better understanding of the factors affecting egg quality. This study will also enable professionals, educators and students alike to acquire in-depth knowledge of the factors influencing egg quality in laying hens, which will undoubtedly

enrich their future work. At the same time, this in-depth examination could also highlight the various gaps existing in literature, and thus provide a better orientation for future research. Finally, this study will highlight areas of research that require further attention to provide theoretical and practical implications.

Research limitations

Despite the novelty of this study and the various results it has produced, it is essential to emphasize that this work is indeed full of shortcomings:

- The documents collected as part of this study came exclusively from the Scopus database, and did not include documents from databases such as Web of Science, PubMed, Dimensions and Cochrane Library...
- The documents collected after the search do not necessarily contain all the literature related to the diversity of keywords. However, the detailed search technique used, the advanced search strategies and the logical use of Boolean operators improved the relevance and accuracy of the results obtained.
- The key term in this search, "egg quality", was combined with other keywords using only "AND" as the Boolean operator. The combined use of the Boolean operators "AND" and "OR" might have provided access to more studies. Also, the limitation of subjects to laying hens could be at the root of such a result. The use of the term "poultry" in the searches might have allowed even greater comprehensiveness of the results obtained.

Literature review

Bibliometric analysis has become an indispensable tool in academic research and scientific evaluation. It enables us to examine the complex network of scientific literature in each field of study, revealing important patterns, trends and influences(Demir, Chatterjee, Zakeri, et al., 2024). The last two decades have been marked by a rapid increase in the number of academic publications, enabling students and researchers to have a well-supported database in terms of literature reviews. According to (Rousseau, 2012) literature review helps us play an important role in effectively using a combination of previous research findings to develop research pathways and create action-based insights to implement and preserve professional judgment and expertise.

However, literature review in its traditional, narrative form is not generalizable, as it focuses on the researcher's individual experience and knowledge whereas the insights of bibliometric analyses could be generalized from the micro to the macro level (Y. Chen et al., 2019; C. Wang et al., 2020). This type of systematic literature review is designed with the aim of achieving a higher level of comprehensiveness and transparency(Cornish, 2015).

According to (Crane, 1972), bibliometrics provides more objective and reliable analyses than other techniques. The sheer volume of new information, conceptual developments and data means that bibliometrics can be used to provide a structured analysis of large amounts of information, deduce trends over time, explore themes, identify changes across disciplinary boundaries, identify the most productive researchers, journals, universities, countries and provide an overview of current research.

Regarding the literature review in this study, it should be noted that there has been no bibliometric analysis that presents an overview of the factors affecting egg quality. This study is therefore the first bibliometric analysis to present the factors affecting egg quality. Nevertheless, there are two studies that have presented in isolation a bibliometric analysis of specific factors that can affect egg quality in laying hens. Table 1 summarizes the literature review.

Table 1. Review of bibliometric analyses specific to factors affecting egg quality

Authors	Year	Keywords	Timeframe	NAR	Database	Software
Uyanga et al.	2023	Chickens, growth performance, heat stress, oxidative stress	2000-2021	468	Web of Science Core Collection	Biblioshiny and VOSviewer
Susilo et al.	2024	Animal welfare, cage-free, housing system, Laying hens, Research trend	1960 -2023	900	Scopus	Biblioshiny
This study	2024	Egg quality, egg, shell, laying hens	2014 -2014	626	Scopus	Biblioshiny and VOSviewer

NAR: Number of articles reviewed

Materials and methods

The bibliometric analysis of this subject involved several stages, as shown in figure 1. The first step in the bibliometric analysis involved selecting a database. Scopus was chosen because it is a comprehensive, multidisciplinary database covering a wide range of scientific journals, conference proceedings, books and other scientific publications. Likewise, Scopus has robust data validation procedures that guarantee the accuracy and completeness of bibliographic information, making it a reliable source for bibliometric analysis(Martín-Martín et al., 2018). To obtain the final data to be used, a process was set up. This process is presented in Table 2. 626 documents were compiled according to inclusion and exclusion criteria.

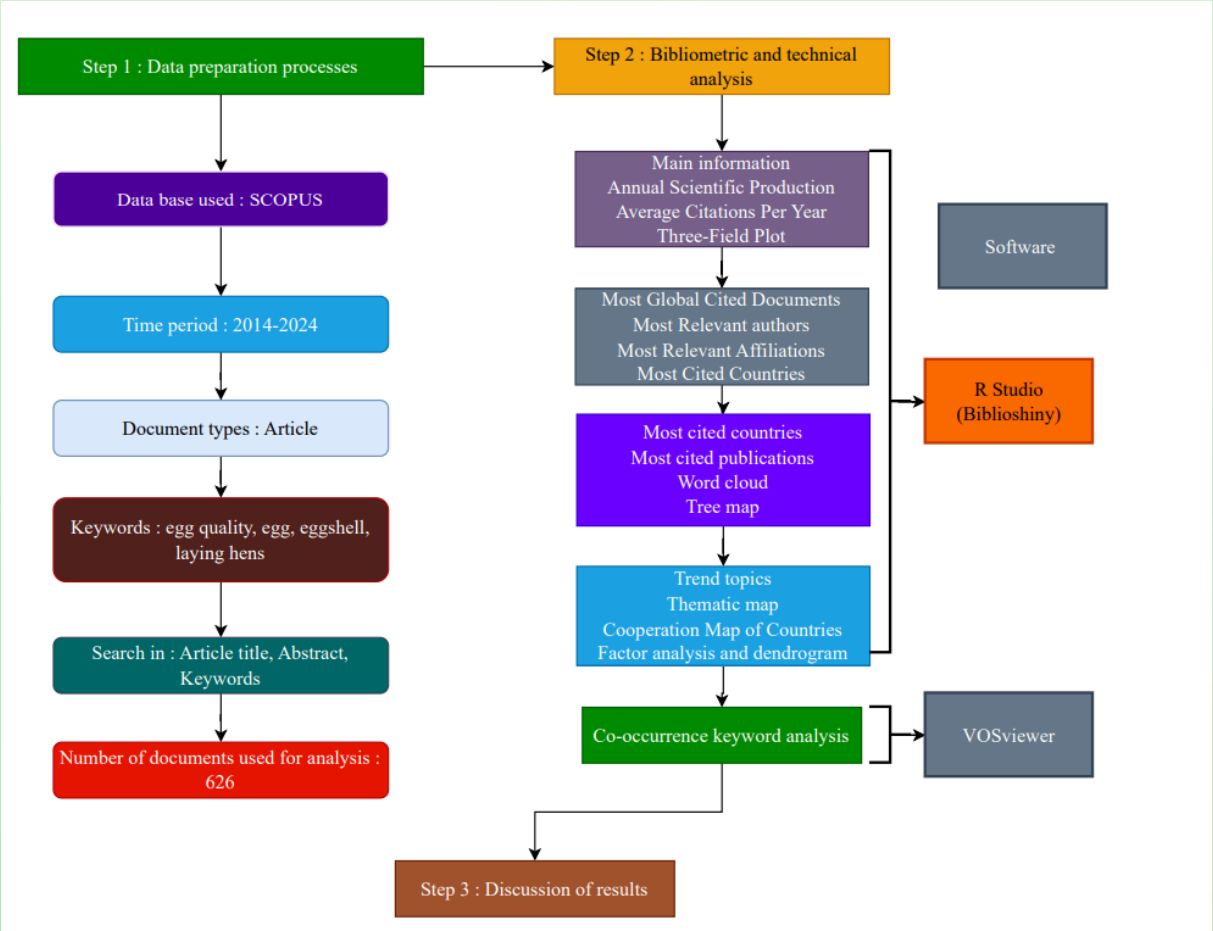

Figure 1. Diagram of the analytical process adopted

Table 2. Method for extracting recent data from Scopus

Keyword	Included	Excluded
Eggquality, egg, shell, laying hens	Document type:Article, Publication language: English, Source type: Journal, Publication year: 2014-2024	Preprints on preprint servers and e-prints, reviews, conference papers, book chapters, notes, comments, editorials, letters

The studies were downloaded in .csv format and were read in the R studio version 4.4.2 program via the bibliometrix package, as well as in the VOSviewer version 1.6.20 program. In this study, the R bibliometric library(Aria & Cuccurullo, 2017) prepared for bibliometric analysis was preferred and the VOSviewer software (van Eck & Waltman, 2017) was used to visualize the results. The second stage involved data analysis via the applications. A total of 17 analyses were generated using the R studio program via the bibliometrix package and the VOSViewer software, created and visualized 2 bibliometric network maps. The third step, as shown in Figure 1, was to discuss the results of the analysis.

Results of bibliometric analysis of data on factors affecting egg quality

Main information

Figure 2 shows the basic information on publications relating to “egg quality”, “eggs”, “shell” and “laying hens”. Biblioshiny's analysis of these keywords yields the following results.

Thanks to the keywords and precise filtering, the Scopus database revealed a total of 626 articles written between 2014 and 2024. Biblioshiny's analysis of this data revealed that 138 scientific journals were used to publish these articles. With an annual growth rate of 2.66% for publications, this figure also shows that the average age of publications is 4.26 years and that the average number of citations per publication is 11.9. In addition, 16 of the 2579 authors published without co-authors, and international collaboration between authors was 21.09%.

Annual status of scientific publications

Figure 3 shows the annual trend in publications relating to “egg quality”, “eggs”, “shell” and “laying hens”.

Figure 2. Main information

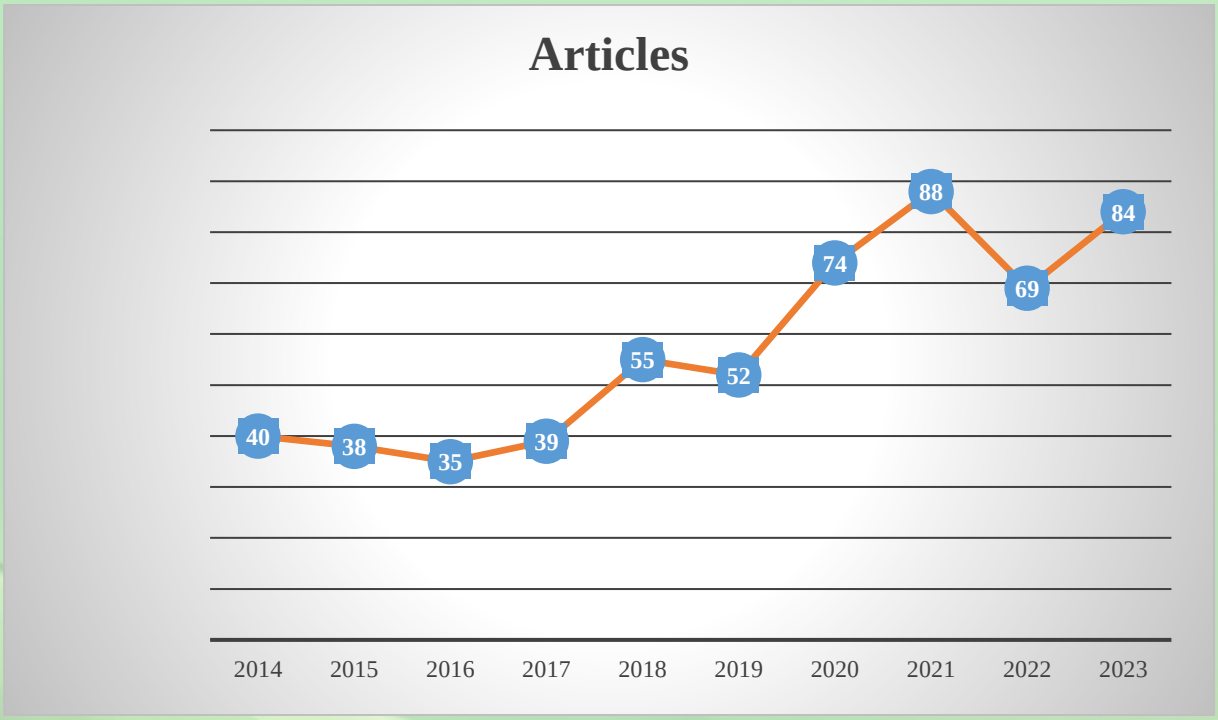

Figure 3: Annual status

Figure 3 shows that the annual publication of scientific articles related to the above keywords varies from year to year. Thus, in 2014, there were 40 articles published, 38 in 2015, 35 in 2016, 39 in 2017, 55 in 2018, 52 in 2019, 74 in 2020, 88 in 2021, 69 in 2022 and 84 articles published in 2023. This figure also reveals that the publication of scientific articles related to “egg quality”, “eggs”, “shell” and “laying hens” has almost doubled in the last three years. However, 2021 is the year in which most articles were produced.

Average annual citations by publication

Figure 4 shows the average total citations per article for “egg quality”, “eggs”, “shell” and “laying hens”. Figure 4 shows the average total citations per article for “egg quality”, “eggs”, “shell” and “laying hens”.

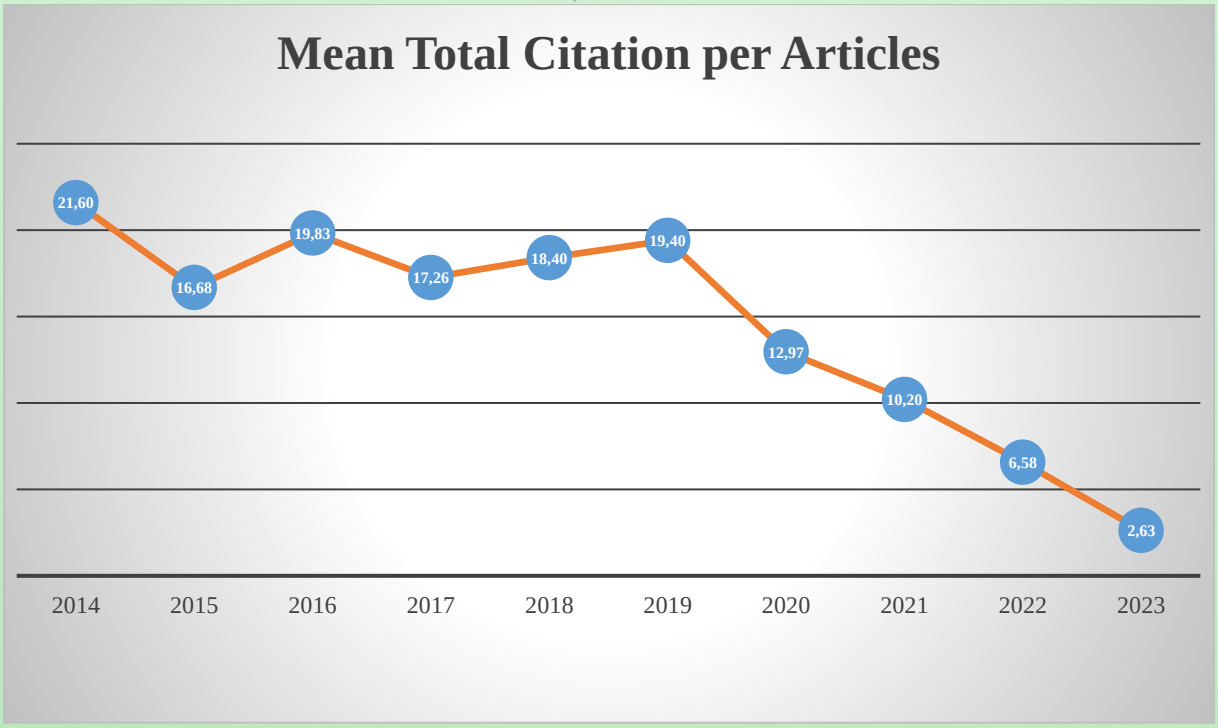

Figure 4. Annual status of citations

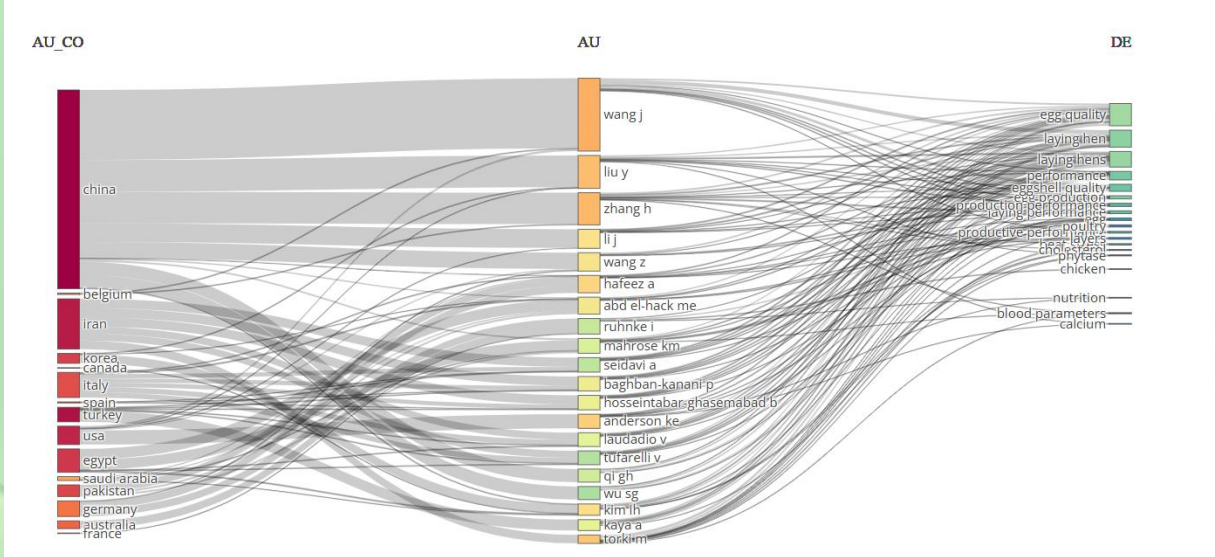

Figure 5. Three field diagrams

This figure shows that in the year 20214, the annual average of total citations per article relating to “egg quality”, “eggs”, “shell” and “laying hens” is 21.6. This number has fallen considerably over time. In 2015 it was 16.68, 19.83 in 2016, 17.26 in 2017, 18.40 in 2018 and 19.4 in 2019. From 2020 to 2023, the annual average of total citations per article is below 15. The year 2023 has the lowest average per article.

Sankey diagram

Thanks to Biblioshiny, the Sankey diagram has been drawn up. This diagram takes three parameters into account. These include “countries”, “authors” and “keywords”. Figure 5 shows this diagram.

This diagram shows that the country that has produced the most scientific articles relating to “egg quality”, “eggs”, “shell” and “laying hens” is none other than “China”. The most published author is “Wang J” and the most recurrent keyword is none other than “egg quality”.

Most productive scientific journals

Table 3 shows the 10 scientific journals with the most articles published in connection with “egg quality”, “eggs”, “shell” and “laying hens”.

From this table, we can see that Poultry Science, Animals and Frontiers in Veterinary Science are the scientific journals with the most articles published, with 123, 70 and 23 articles published respectively. Poultry Science tops the list, followed by the other two scientific journals.

Most productive authors

Figure 6 shows the authors with the most articles published on "egg quality", "eggs", "shell" and "laying hens". This figure reveals that Wang J, Zhang H and Liu Y are the authors who have written the most articles related to "egg quality", "eggs", "shell" and "laying hens". Compared with the other two authors, Wang J alone wrote 26 articles, which puts him in first place in this ranking. Zhang H and Liu Y have written 13 and 12 papers respectively, taking second and third place.

Universities with the most publications

Universities were also involved in writing and publishing articles on "egg quality", "eggs", "shell" and "laying hens", as shown in Table 4. According to this table, the universities with the most research and publications related to the above keywords are none other than Sichuan Agricultural University, China Agricultural University and Feed Research Institute, with 85, 78 and 62 articles respectively. Sichuan Agricultural University tops the list.

Scientific output by country

Figure 7 shows the most active countries in terms of article production in relation to “egg quality”, “eggs”, “shell” and “laying hens”. On the map, the colors dark blue, blue and gray indicate respectively the country with the most dissemination, the country with the least dissemination and the country with no dissemination (Demir, Chatterjee, Kadry, et al., 2024). The table on the map shows the 10 countries that produce the most articles related to “egg quality”, “eggs”, “shell” and “laying hens”. The table shows that China (928) has produced the most scientific articles. It is followed by Brazil (301) and Turkey (210).

Scientific collaboration between countries

Figure 8 shows a map of worldwide collaboration on studies involving keywords such as “egg quality”, “eggs”, “shell” and “laying hens”. The figure shows that Egypt's collaboration with Saudi Arabia, with a total of 14 documents produced, is in first place. In second place, with 12 documents produced, is the collaboration between China and the USA. In third place was the collaboration between China and Egypt, with 6 documents produced. However, China also collaborated with Pakistan, and the USA in turn collaborated with Germany and the UK. These various collaborations between countries demonstrate the extent to which the factors influencing egg quality are a topical issue worldwide.

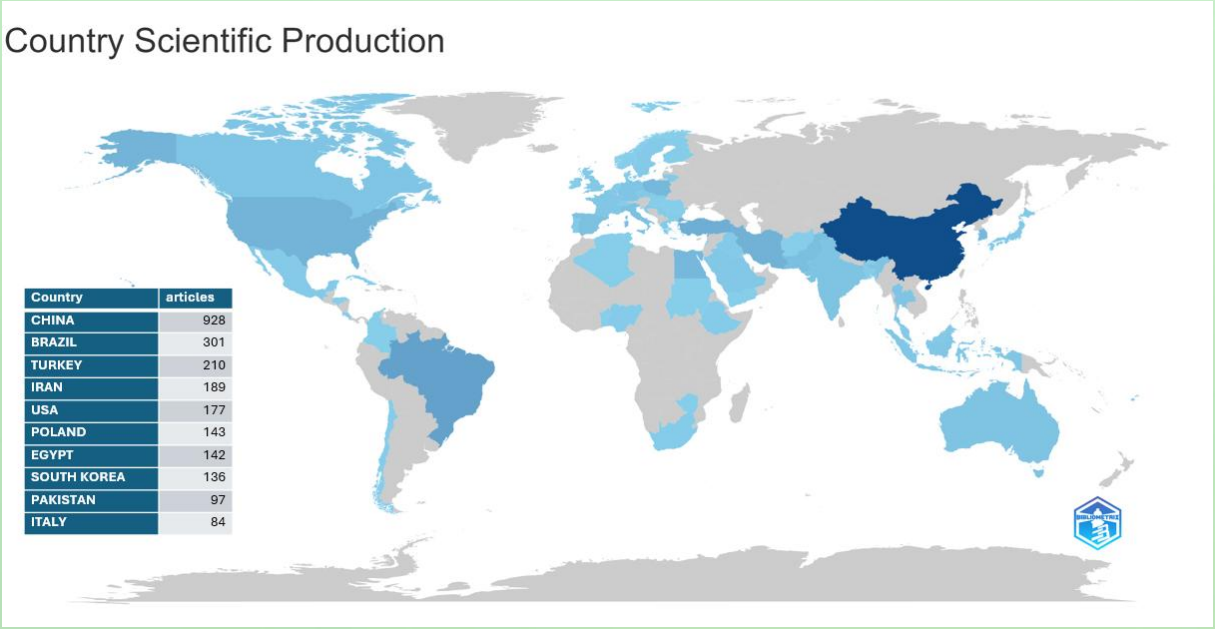

Figure 7. Most productive countries

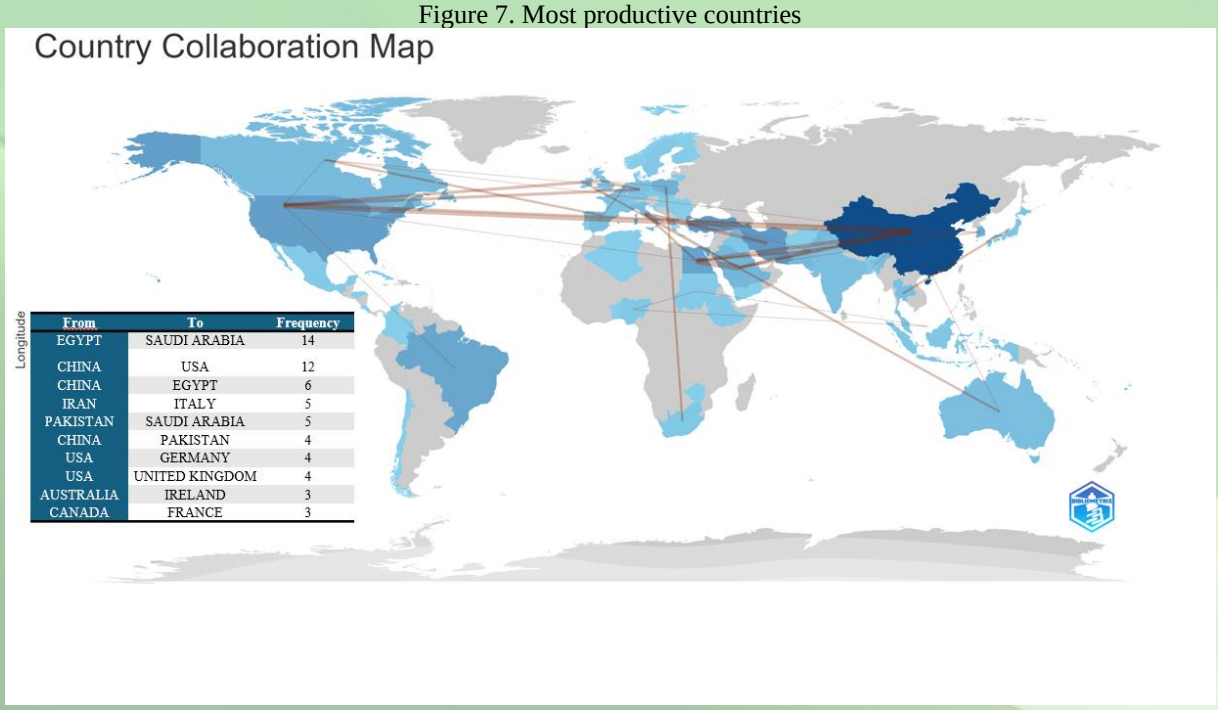

Figure 8. Cooperation map of countries

Most referenced countries

Table 5 shows the most cited countries for topics relating to “egg quality”, “eggs”, “shell” and “laying hens”. The table shows that, of the 10 countries mentioned, China is the most referenced, with 1905 citations. The USA takes second place with 580 citations and Egypt, with 459 citations, takes third place among the most referenced countries.

Most important documents

Table 6 refers to the 10 most cited documents. The most cited document refers to the article or research paper that has accumulated the highest total number of citations from other academic works. In other words, it is the article that has been most referenced by other researchers and has therefore received the greatest cumulative number of citations(Demir, Chatterjee, &Pamucar, 2024).

According to this table, of the 10 most cited articles, the most cited article is entitled “Productive performance, eggshell quality, and eggshell ultrastructure of laying hens fed diets supplemented with organic trace minerals” (Stefanello et al., 2014). Published in the journal Poultry Science, it alone totals 117 citations. The second most cited article is “Evaluation of Black Soldier Fly (Hermetia illucens) Larvae and Pre-Pupae Raised on Household Organic Waste, as Potential Ingredients for Poultry Feed” (Kawasaki et al., 2019). With 110 citations, it is published in the journal Animals. The most cited article occupying third place with 91 citations is “Effects of acute and chronic heat stress on the performance, egg quality, body temperature, and blood gas parameters of laying hens” (Barrett et al., 2019). It is published in the journal Poultry Science.

Word cloud

Figure 9 shows the word cloud related to “egg quality”, “eggs”, “shell” and “laying hens”.
Generated using the Biblioshiny program, Figure 9 shows that the keywords “egg quality”, “laying hens” and “laying hen” are those most often used in articles relating to “egg quality”, “eggs”, “shell” and “laying hens”.

Tree map

Figure 10 shows the frequency of keyword use.

Figure 9. Word cloud

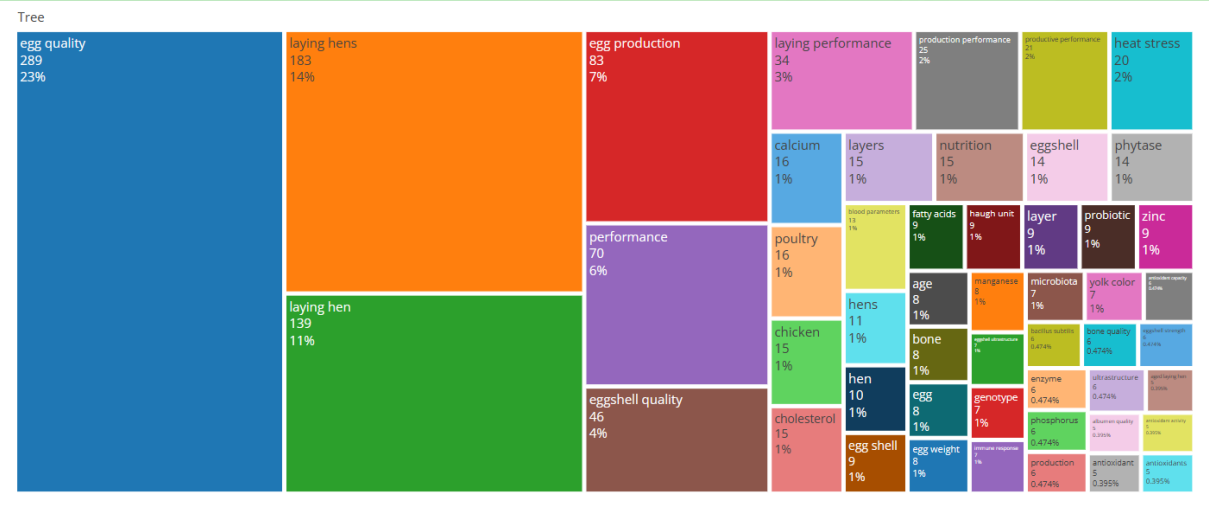

Figure 10. Tree map

According to this figure, “egg quality”, “laying hens” and “laying hen” have the highest usage rates. “Egg quality”, as shown in the blue rectangle, is the most frequently used keyword, accounting for 23% of all keywords. In second place comes “laying hens”. It occupies the orange rectangle and has a 14% usage rate. Finally, in third place comes the keyword “laying hen”, with an 11% usage rate. It can be seen in the green rectangle.

Trend topics

Trend topics in the literature related to the keywords “egg quality”, “eggs”, “shell” and “laying hens” from 2014 to 2024 are shown in Table 7.

From the elements of this table, the dominant trending theme during the first quarter of 2017, the second quarter of 2020 and the third quarter of 2022 was “egg quality”. Similarly, during the first quarter of 2018, the second quarter of 2020 and the third quarter of 2022, the trending term was “laying hens”. Finally, “laying hen” was the trending theme in Q1 2018, Q2 2021 and Q3 2022.

Author's keyword theme map

To make a visual representation of the existing relationships between words, topics or keywords used in the research literature, a thematic map was made. Figure 11 shows that studies carried out in connection with keywords such as “egg quality”, “eggs”, “shell” and “laying hens” are grouped under 4 distinct themes with different intensities.

Table 7.Trending topics

Term	Frequency	Year (Q1)	Year (Q2)	Year (Q3)
Egg quality	289	2017	2020	2022
Laying hens	183	2018	2020	2022
Laying hen	139	2018	2021	2022
Egg production	83	2017	2020	2022
Performance	70	2016	2018	2021
Eggshell quality	46	2018	2021	2023
Production performance	25	2020	2021	2022
Heat stress	20	2015	2018	2022
Poultry	16	2020	2022	2023
Nutrition	15	2015	2018	2022

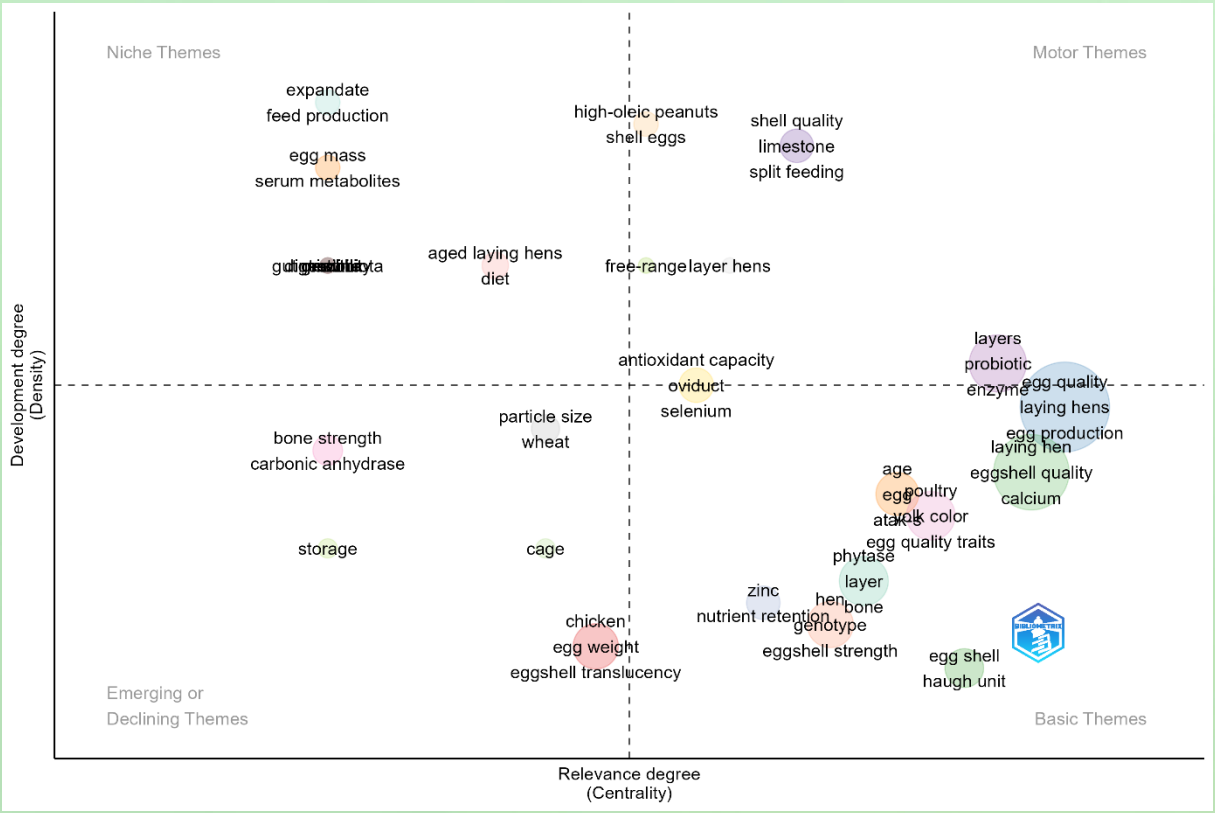

Figure 11. Thematic map

When the author's keywords were considered, the niche themes were “expandate, feed production, egg mass, serum metabolites”. The driving themes were “shell quality, limestone, layers, probiotic”. For basic themes, the keywords were “haugh unit, phytase, zinc, age, eggshell strength”. For emerging or declining themes, the keywords were “storage, cage, bone strenght, carbonic anhydrase, egg weight...”.

Author keyword co-occurrence analyses

To facilitate the identification of an article, keywords are generally used. The prevalence of a keyword in an article underlines its importance. To highlight the joint effects of working with a set of keywords and the research knowledge base, VOSviewer was used. By examining the keywords indexed in the articles, a total of 1,450 keywords were identified. 148 keywords were considered in the analysis below, and the threshold value in VOSviewer was set at 3. The results of this analysis are shown in figure 12.

From this figure, we can see that different colors are used to represent different keywords. However, each circle in the visualization shows the inclusion of a particular keyword in the sub-domains of the network theme of factors affecting egg quality. Of these different circles, the most imposing determined from the quantity of elements they encompass are respectively “egg quality” (group 1), “laying hens” (group 2) and “eggs production” (group 3). The similarly colored circles represent the distribution in a comparison region. Group 1 (egg quality) is shown in blue. Keywords in this group include eggshell quality, laying performance, production performance... In group 2 (laying hens) represented by brown, keywords include cholesterol, heat stress, production performance... As for group 3 (eggs production) represented by green, keywords in this group include probiotic, nutrition, zinc, vitamin E...

As shown in figure 13, the VOSviewer software also enabled the use of the "visualization by overlay" technique. This technique was used to facilitate the incorporation of keywords with distinct colors corresponding to the year of publication.

In this case, the average publication year (yellow) for the newly introduced terms is 2022. Based on the time elapsed since their publication, the colors of the elements have been determined. Figure 12 illustrates the period from 2018 to 2022, represented by the progression of purple-green-yellow colors. On the one hand, keywords such as bacillus subtilis, eggshell, probiotics and nutrient digestibility were studied during the period 2018-2022. On the other hand, it has been observed that in recent times, keywords such as antioxidants, oxidative stress, calcium and health status have been included in scientific publications.

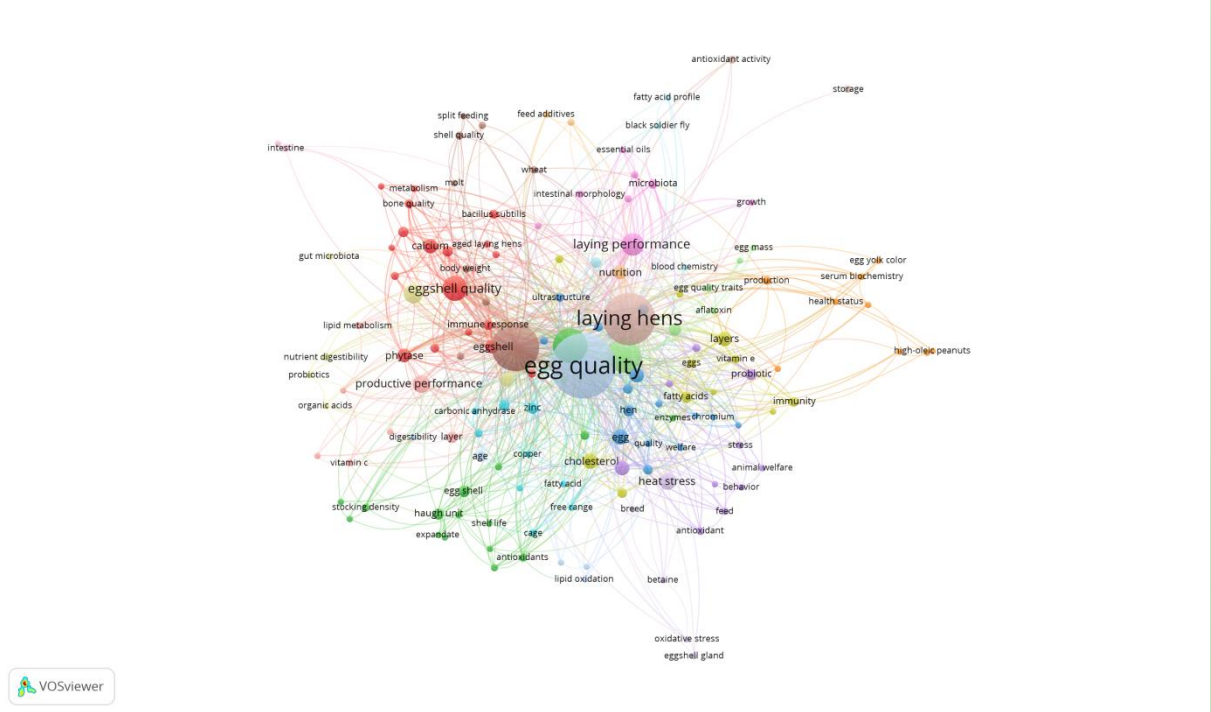

Figure 12. Keyword network map

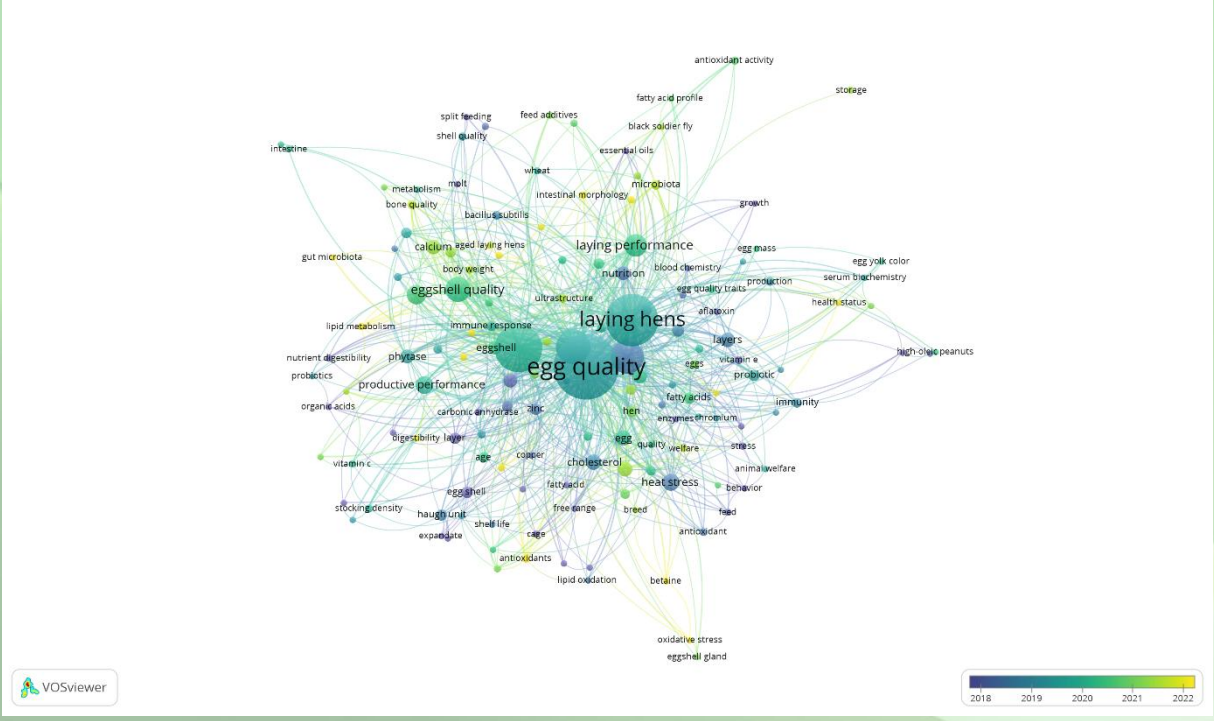

Figure 13. Timeline of keywords

Factor analysis of author keywords

To reduce complexity and shed light on hidden structures in multivariate data sets factor analysis is generally used. In other words, this statistical technique facilitates the understanding and management of relationships between variables in a data set. Keyword factor analysis is shown in figure 14.

When analyzing keywords relating to factors influencing egg quality, keywords such as “yolk color, fatty acids, production, xylanase, shell quality, zinc and eggshell” are grouped together in the blue cluster due to their high factor loadings. On the other hand, within the same cluster, keywords such as “probiotic, egg quality, stocking density, nutrition, genotype, aged laying hen, eggshell ultrastructure, vitamin D3, blood parameters antioxidant...” are represented by small triangles. In parallel, keywords such as “body weight, albumen quality, manganese, ultra structure, tibia, bone strength and eggshell quality” make up the red cluster, and keywords such as “phytase, bone, eggshell, bone quality, phosphorus, calcium and bacillus subtilis” in turn form the green cluster.

Dendrogram

Dendrograms are tree-shaped graphs showing the structural relationships obtained because of hierarchical cluster analysis(Demir, Chatterjee, Kadry, et al., 2024). Used in bibliometric analyses, they enable the identification of topics with which articles share a certain similarity or are directly related. Figure 15 shows a thematic dendrogram to illustrate the hierarchical relationship between keywords.

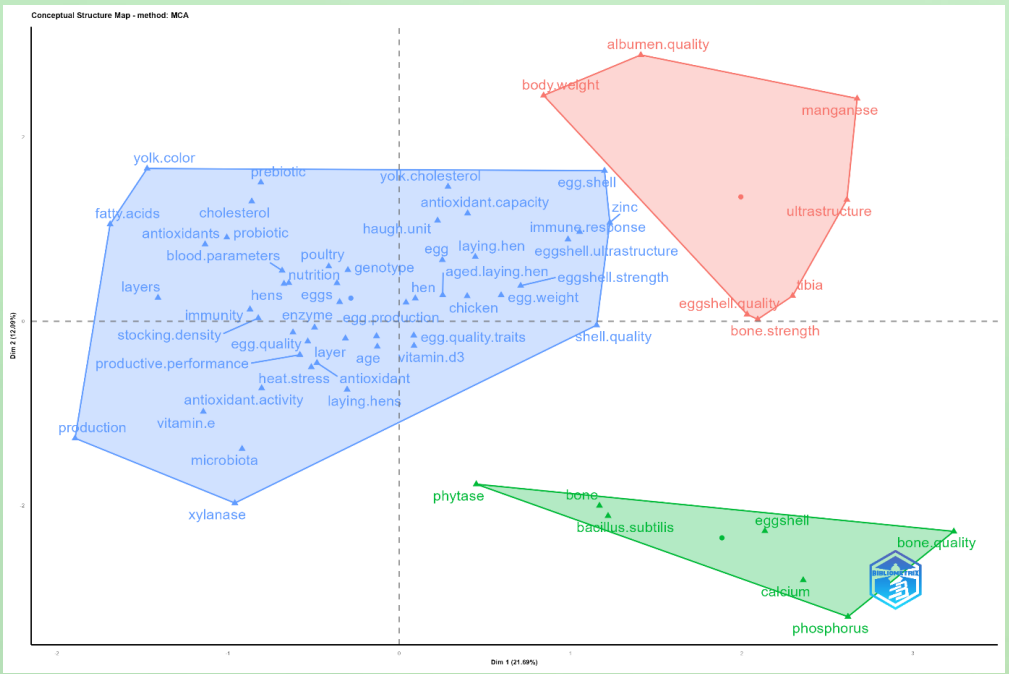

Figure 14. Factor analysis of author-keywords

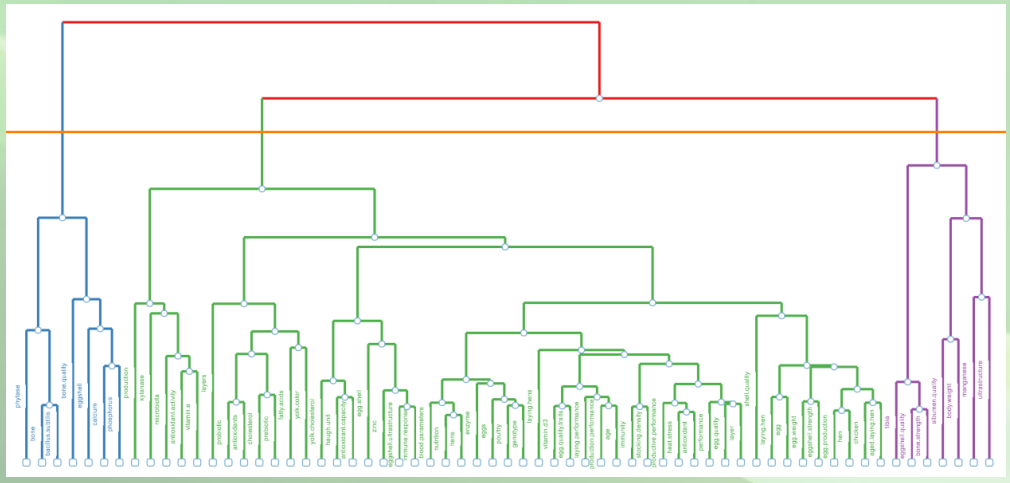

Figure 15. Topic dendrogram of author keywords

Discussion

Below the orange horizontal line of the thematic dendrogram in figure 15, the keywords are divided into three distinct groups (blue, green and violet). These clusters highlight how the themes relate to each other. In the blue cluster, the terms or topics that are linked are "phytase, bone, bacillus subtilis, eggshell, calcium and phosphorus". Furthermore, in the green cluster, relevant terms that share a certain similarity include: "production, xylanase, vitamin, antioxidants, genotype, egg quality, aged laying hen...". For the purple cluster, the associated topics are "tibia, eggshell quality, bone strength, albumen quality, body weight, manganese and ultrastructure".

The quality of eggs produced by laying hens has been the subject of much debate in recent years. With the aim of identifying and controlling the factors that can affect egg quality, research in recent years has been devoted to this topic. The number of publications and citations in this field are indicators of the interest and progress made by researchers(Roberts, 2004; Stefanello et al., 2014; Kawasaki et al., 2019; Hisasaga et al., 2020; Abebe et al., 2023; Batkowska et al., 2023). Over the past three years, there has been a significant increase in annual publications on factors that can affect egg quality, and so far, the highest number of articles has been reached in 2021. The annual number of publications increased slowly from 2014 to 2017, with fewer than 50 articles per year. The increase observed from 2018 onwards could probably be explained following an awareness of the impact of factors on laying hen productivity as well as egg quality. Indeed, there are certain factors that influence both the productivity of laying hens and the quality of their eggs (Travel et al., 2010; Seven et al., 2011; Barrett et al., 2019; Ward, n.d.). The most cited international literature testifies that trace element supplementation(Stefanello et al., 2014; Xiao et al., 2014), protein source replacement (Al-Qazzaz et al., 2016; Kawasaki et al., 2019), heat stress (Barrett et al., 2019; Mignon-Grasteau et al., 2015), the use of prebiotics(Guo et al., 2020), probiotics(Park et al., 2016), the type of production system and the age of layinghens(Samiullah et al., 2017) are factors that could well affect egg quality and laying hen productivity. In short, the major factors affecting egg quality include feed, type of production system, age and temperature. The following studies corroborate this assertion (Petersen, 1965; Travel et al., 2011; John-Jaja et al., 2017). Similarly, the last 5 years have seen a 63.9% increase in annual scientific output, coupled with a significant drop in the average number of citations per publication, highlighting a negative correlation between publication volume and impact.

Furthermore, China stood out for its major quantitative contribution to research into factors affecting the quality of laying hen eggs, ranking first in terms of publications, lead authors and institutional affiliations. In addition, the study of international collaborations revealed close links between China and countries such as the USA, Pakistan and Egypt, particularly in the field of factors affecting hen egg quality. The study also revealed that of the top 10 research universities, the top 2 were Chinese. "Sichuan Agricultural University was the most productive in terms of egg quality research overall. As for the authors, Wang J, Liu Y and Zhang H, they contributed relatively to egg quality research. Wang J focused much more on factors such as feed, production system, gut microbiota during his egg quality research(X. L. Wang et al., 2009; J. Wang et al., 2017; X. C. Wang et al., 2017; X. Wang et al., 2017, 2018; Dai et al., 2022). As far as Liu Y and Zhang H are concerned, they have mainly focused their research on nutrition, on diet supplementation and the use of probiotics in laying hen feed.

They tested a multitude of diets for laying hens to assess their impact on egg quality(F. Chen et al., 2021; H. N. Liu et al., 2014; Y. Liu et al., 2017, 2021, 2023; Y. J. Liu et al., 2019; Xiang et al., 2019; Y. N. Zhang, Wang, et al., 2017; Y. N. Zhang, Zhang, Wang, et al., 2017; Y. N. Zhang, Zhang, Wu, et al., 2017).Bibliometric analysis of document sources (including journals, books, etc.) is important to provide up-to-date information and trends for a particular research area, as well as to guide researchers in selecting appropriate journals for their research communication (Cheng et al., 2022; F.-H. Liu et al., 2022). Poultry Science, Animals and Frontiers in Veterinary Science have established themselves as the main platforms for disseminating research on factors influencing egg quality in laying hens.

To facilitate indexing and searching of an article, authors generally propose a list of keywords that reflect the main ideas developed in their work. In this study, the terms "egg quality", "laying hens", "egg production" and "performance" recur repeatedly in the dataset analyzed through the word cloud (WordCloud), heat map (TreeMap) and trend analysis (Trend Topics), confirming the centrality of these keywords to the field in relation to factors affecting egg quality. Analysis of the keyword thematic map makes it possible to organize keyword groupings according to density and centrality in a single circle for mapping as a two-dimensional image (Ejaz et al., 2022).

From the Author's Keywords, it was identified that driving topics including "shell quality", "limestone", "layers" and "probiotic" have been well studied in relation to factors affecting egg quality in laying hens (Mohan et al., 1995; J. L. Zhang et al., 2012; Gholiabad et al., 2014; Ray et al., 2022). However, some topics that have been weakly developed among both emerging and declining themes (storage, cage, bone strenght, carbonic anhydrase, egg weight) and core themes (haugh unit, phytase, zinc, age, eggshell strength) could be of research interest for further studies on factors affecting egg quality in laying hens. The co-occurrence network of all the keywords revealed that current research on factors affecting egg quality focused mainly on laying hens as research topics (red nodes), on performance studies of these hens (green nodes) and on eggshell quality and strength (blue nodes). To our knowledge, the present study is the first to examine the state of global research and emerging trends on factors affecting egg quality using the bibliometric approach between 2014 and 2024. This analysis focuses on

publications indexed in the Scopus database. Considered as a literature review during this period, the present study aims to understand scientific productivity, keywords, publication trends and important factors affecting egg quality in laying hens. The results of this study pave the way for new perspectives and research directions about egg quality.

Conclusion

This study inspected and evaluated the scientific achievements made in the field of research into factors affecting egg quality in laying hens worldwide, using the Scopus database. Key current researchers were identified, and regional distributions and publications were mapped. In terms of countries having produced the most papers in research into factors affecting egg quality in laying hens, China literally stood out from the rest. Wang J was also identified as the most productive author following the results of the bibliometric analysis carried out on factors affecting the quality of eggs from laying hens. The most cited journal for publications related to this study topic is "Poultry Science". "Egg quality", 'laying hens' and 'performance' are the keywords most frequently used by authors. By summarizing the factors affecting egg quality in laying hens, i.e. feed, type of production system, age and temperature, we hope that these results will provide a focus for future research into egg quality. It's true that the Scopus database was the focal point of this study.

Abstract

In recent years, the increasing demand for chicken meat has led to a rise in broiler production. This increase has encouraged the use of various feed additives to further improve the productivity of broilers and enhance their efficiency. This study aims to analyze the extent to which feed additives used in broiler farming over the past 20 years have impacted meat quality. Data on feed additives used in broiler farming and their effects on meat quality were analyzed using bibliometric methods. For this purpose, Scopus and Vosviewer databases were utilized, and articles were screened using the keywords "broiler," "feed," "supplements," and "meat quality." A total of 536 documents were reviewed. The data from these documents were analyzed using the "Biblioshiny" and "Excel" software packages. Analysis of articles using these keywords by publication year showed that 2012 had the highest number of publications, with 13 articles. Citation analysis revealed that the year with the most citations was 2007, with an increase of 104.67%. Among the countries conducting the most research, China was identified as the leading contributor. The most prolific author was Kim IH. During the period between 2004 and 2014, *Poultry Science* emerged as the most significant journal with 156 published articles, followed by *British Poultry Science* with 46 articles, and *Tropical Animal Health and Production* with 18 articles. Among the keywords "broiler," "feed," "supplements," and "meat quality," the most frequently researched term was "meat quality." The university with the highest number of publications was *Nanjing Agricultural University*, while China stood out as the country with the most citations and the highest level of collaboration. Among collaborative efforts, China and Saudi Arabia were prominent partners. Frequently used terms in the analyzed studies included "diet," "chickens," "animal feed," "dietary supplement," and "meat." This study investigated the changes and developments in the effects of feed additives on meat quality over the years, aiming to identify the substances affecting quality, their varieties, and their usage levels over time. It is anticipated that this study will guide and contribute to future research on feed additives, their application goals, and potential innovations in poultry farming.

Key Words: *broiler, feed, supplements, meat quality, bibliometric analysis, Biblioshiny, VOSviewer*

Broyler Yetiştiriciliğinde Kullanılan Yem Katkı Maddelerinin Et Kalitesi Üzerine Etkilerinin Bibliyometrik Analizi

Özet

Son yıllarda artan tavuk eti tüketim talebine bağlı olarak etçi tavuk üretiminde de artış görülmektedir. Bu artış etçi tavukların verimini daha da geliştirmek, alınan yararlanımı arttırmak için çeşitli yem katkı maddelerinin kullanımını teşvik etmiştir. Bu çalışmada son 20 yılda broyler yetiştiriciliğinde kullanılan yem katkı maddelerinin et kalitesi üzerinde ne derece değişiklikler meydana getirdiğini analiz etmek hedeflenmiştir. Broyler yetiştiriciliğinde kullanılan yem katkı maddeleri ve et kalitesine etkisi hakkında veriler bibliyometrik analiz ile çalışılmıştır. Bu amaç doğrultusunda Scopus ve Vosviewer veri tabanı kullanılmış, 'broiler', 'feed', 'supplements', 'meat quality' anahtar kelimeleri ile makaleler taranmıştır. Bu tarama için 536 doküman incelenmiştir. Bu dokümanın içerdiği verilerin analizi için 'Biblioshiny' ve 'excel' paket programları kullanılmıştır. 'Broiler', 'feed', 'supplements', 'meat quality' anahtar kelimelerinin kullanıldığı makaleler yıllara göre incelendiğinde en çok yayın yapılan 13 makale ile 2012 yılı olmuştur. Bu anahtar kelimeler ile yapılan atıflar incelendiğinde %104,67 ile 2007 yılı en çok atıf yapılan yıl olmuştur. Yapılan çalışmalar incelendiğinde en çok çalışma yapan ülke Çin olarak tespit edilmiştir. En üretken yazar olarak ise Kim İH. Karşımıza çıkmaktadır. 2004-2014 yılları arasında yapılan çalışmalarda yayımlanan 156 makale ile' Poultry Science' en önemli dergi olmuş, 46 makale ile 'British Poultry Science 'ile ikinci sırada yer almış, 'Tropical Animal Health and Production 'dergisi ise 18 makale ile üçüncü sırada yer almıştır. 'Broiler', 'feed', 'supplements', 'meat quality' anahtar kelimeleri arasında en çok araştırılan kelime 'meat quality' olmuştur. En çok yayın yapan üniversite 'Nanjıng Agricultural University' olurken en çok atıf alan ve en çok iş birliğinde bulunan ülke Çin olmuştur. En sık iş birliği yapan ülkeler incelendiğinde Çin ve Suudi Arabistan öne çıkmaktadır. Yapılan araştırmalarda ön plana çıkan ve sıklıkla kullanılan kelimeler' diet, 'chickens','animal feed', 'dietary supplement' ve 'meat' olarak tespit edilmiştir. Broyler yetiştiriciliğinde kullanılan yem katkı maddelerinin et kalitesi üzerine etkilerinin yıllar içindeki değişimi ve gelişimini araştırmak için yapılan bu çalışma da kaliteyi etkileyen maddelerin tespiti, çeşitleri ve yıllara göre kullanılma düzeylerini tespit etmek amaçlanmıştır. Bu çalışmanın ilerleyen dönemlerde yapılacak olan yem katkı maddeleri araştırmaları ve kullanım hedeflerine, tavuk yetiştiriciliğinde gidilebilecek olan yeniliklere yol gösterici olabileceği ve katkı sağlayabileceği düşünülmektedir.

Anahtar Kelimeler: *broiler, feed, supplements, meat quality, bibliometrik analiz, biblioshiny, Vosviewer*

Giriş

Günümüzde tavuk etine artan talebe bağlı olarak tavuk eti üretiminde de artış gözlenmektedir. Bu artan talep oranı çeşitli sebeplerle ilişkilendirilebilir. Tavuk göğüs eti, tüketici talebine uygun olarak düşük yağ, sodyum ve kolesterol içeriği ile karşımıza çıkmaktadır (Cavani ve ark., 2009). Etçi tavuk olarakta bilinen broyler, tavuk eti tüketimini karşılamak için tercih edilen tür konumuna gelmiştir. Artarak ilerleyen broyler üretimi günümüzde yaygınlaşmışken, şu anda broyler etinin çeşitli özelliklerini değiştirerek et kalitesini artırmaya yönelik çalışmalar yapılmaktadır. Görünüm, doku, sulu olma, su içeriği, sertlik, yumuşaklık, koku ve tat, tüketicilerin et ürününü satın almadan önce ve sonra yaptığı ilk ve son kalite değerlendirmesini etkileyen en önemli ve algılanabilir et özellikleridir (Mir ve ark.,2017). Bu artan tavuk eti talebini karşılamak için, broyler eti üretiminde önemli gelişmeler kaydedilmiştir. Örneğin, 1957 yılında 42 günlük broylerlerin ağırlığı yaklaşık 586 g ve yemden yararlanma oranı 2,8 iken günümüz broylerleri 42 günlükken yaklaşık 3278 g ağırlığa sahip olup, yemden yararlanma oranı ise 1,55'tir (Choi ve ark.,2023). Hayvanların bağırsak fonksiyonunun ve et kalitesinin yem katkı maddeleri aracılığıyla olumlu yönde değiştirilmeye çalışma uygulamaları, büyüme performansını ve yem verimliliğini artırmak için önemli bir araç olarak kabul edilmiştir (G K Collington ve ark.,1990). Üretim de performans parametrelerine ek olarak tavuk eti kalitesine katkı sağlamaya yönelik çalışmalar hedeflenmiştir. ''Kalite, bir ürünün bireysel birimlerini ayırt eden ve bu birimin kullanıcıya kabul edilebilirlik derecesini belirlemede anlam taşıyan özelliklerin birleşimidir'' (Groom 1990). Et kalitesinde etkili değişimler meydana getirebilecek faktörler bulunmaktadır. Et kalitesiyle en ilişkili olan faktörler, kesim öncesi ve sonrası uygulamalar, tavuğun yaşı, ırkı ve beslenmesi olarak sıralanmaktadır. (Pelicano ERL ve ark.,2003). Rasyona antibiyotik katılması tavuk gelişimi ile yemden yararlanma verimliliğini olumlu yönde etkilemekte ve olası patojenlerin gelişimini önleme konusunda destekleyici olduğu bildirilmektedir (Stutz ve Lawton, 1984; Gaskins ve diğ., 2002). Avrupa Birliği'nin yemlerdeki antibiyotiklerin profilaktik kullanımını yasaklaması, tavukçuluk endüstrisinde alternatiflerin aranmasını hızlandırmıştır (Janardhana ve diğ., 2009). Bununla birlikte, doğal olarak kullanılan yöntemlerden enzimler, prebiyotikler, probiyotikler ve fitobiyotikler üzerine çalışmalar yapılmasının önü açılmıştır (Dahiya ve ark., 2006; Wei ve Shibamoto 2007; Ndelekwute ve ark., 2015). Fitobiyotikler" ya da "fitojenik yem katkıları" hayvan yemlerine katıldığında fonksiyonel özelliklerinin yanında aromatik özellikleri de bulunan, aromatik ve baharatlı bitkilerden elde edilen bitki özleri için kullanılan bir terimdir (Yeşilbağ, 2007). Çeşitli bitkisel özlerin birtakım işlemlerden geçerek işlenmesi ile öz yağlar elde edilebilmektedir. Bu özler, bitkilerden buhar damıtma yoluyla veya sıkılarak özünü çıkarma yöntemiyle elde edilmektedir. Elde edilen bitkisel özlere; aromatik yağ, uçucu yağ, esansiyel yağ, eterik yağ ya da bitkisel öz yağlar denir. (Yeşilbağ, 2007). Çeşitli yazarlar, hayvan üretiminde antibiyotiklere alternatif olarak kabul edilen çeşitli bileşenleri kapsamlı bir şekilde incelemiş ve karşılaştırmıştır (Langhout, 2000; Mellor, 2000'a, b; Wenk, 2000; Taylor, 2001). Antibiyotik maddelerin kullanılmadığı durumlarda, prebiyotik etki gösteren maddelerim kullanımı, bağırsak florası ve hayvanın yemden yaralanma veriminin arttırılması için olumlu açıdan destek sağlayacak yöntemlerden biri olmuştur. En yaygın olarak araştırılan iki prebiyotik oligosakarit frukto-oligosakaritler (FOS) ve mannan-oligosakaritlerdir (MOS) (G.-B. Kim ve ark.,2010). Yem katkı maddesi olarak kullanılan bir diğer alternatifte bitkisel özlerdir. Bitkisel özlerin kullanımı daha çok kalabalık yetiştirmelerin görüldüğü işletmelerde yem katkı maddesi olarak hayvanın gelişim durumunun olumlu yönde artması amacı ile kullanılmaktadır (J. Abo Omar ve ark., 2016). Bu amaçla çeşitli aromatik bitkilerin rasyona katılması yoluyla besleme yöntemi gerçekleştirilmektedir. Tercih edilen bazı aromatik bitkiler arasında kekik, nane, adaçayı, lavanta gibi çeşitler görülmektedir. Hayvan sağlığı üzerindeki olumlu etkileri; iştah ve yem alımının uyarılması, sindirim enzim salgılanmasının arttırılması, bağışıklık sisteminin iyileştirilmesi ve antiviral, antioksidan ve antihelmintik şeklinde sıralanabilmektedir (Kamal Jamal Issa ve J. M. Abo Omar,2016). Diğer bir popüler yem katkı maddesi ise uçucu yağlardır. Uçucu yağlar, hayvan üretiminde kullanılmak üzere piyasaya sürülmüş ve "sindirim artırıcılar" olarak tanıtılmaktadır (Williams ve Losa, 2001). Uçucu yağ, bitki materyallerinden izole edilebilen, aromatik özelliklere sahip, uçucu bileşiklerin bir karışımıdır (Oyen ve Dung, 1999). Şu ana kadar tavukçuluk üretiminde kullanılan aromatik yağlar arasında kekik (Origanum vulgare), pelin (Artemisia vulgaris), soğan (Allium cepa), dağ kekiği (Satureja montana), Avustralya çay ağacı (Melaleuca alternifolia), rezene (Foeniculum vulgare), zerdeçal (Curcuma longa), limon melisası (Melissa officinalis), nane (Mentha piperita), biberiye (Rosmarinus officinalis), adaçayı (Salvia officinalis), tarçın (Cinnamomum zeylanicum), kekik (Thymus vulgaris), zencefil (Zingiber officinale), okaliptüs (Eucalyptus), sarımsak (Allium sativum) ve karanfil (Syzygium aromaticum) yağları bulunmaktadır (Michalina Adaszyńska-Skwirzyńska ve Danuta Szczerbińska,2007). Esansiyel yağların antimikrobiyal özellikleri iyi bilinmektedir (Kalemba & Kunicka, 2003). Esansiyel yağların antimikrobiyal özellikleri, esas olarak fenoller, aldehitler ve terpenlerden kaynaklanmaktadır; bu bileşikler, bakteri hücre zarlarının bütünlüğünü ve fonksiyonunu bozma yeteneğine sahiptir (Di Pasqua ve diğerleri, 2007).

Kullanılan bir diğer yöntem ise yemlere antioksidan maddelerin ilavesi şeklinde olmaktadır. Antioksidanlar endojen ve eksojen olarak ikiye ayrılmaktadır ve Eksojen antioksidanlar ise genellikle gıdalar yoluyla alınan doğal ve sentetik antioksidanları kapsamaktadır. Eksojen antioksidanlara örnek olarak çinko, bakır, selenyum, likopenler verilirken endojen antioksidanlara ürik asit, melatonin ve albümin örnek verilmektedir (Gümüş ve Küçükersan,

2017). Tercih edilen önemli antioksidanlar arasında E vitamini, askorbik asit, β-karoten, glutatyon, karnozin, homokarnozin ve anserin gibi doğal antioksidan maddeler sıralanmaktadır (Konyalıoğlu 2001). Kanatlılar, normal şartlar altında vücutta biriken serbest radikalleri antioksidan sistemleriyle etkisiz hale getirebilir. Ancak stres gibi etmenler, serbest radikal düzeylerini artırarak vücudun endojen antioksidan kaynaklarını tükenmesine neden olabilir. Bu durumda, yem rasyonlarında yapılan düzenlemeler oksidatif bozulmayı engelleyebilir ve oksidatif stresin etkilerini azaltabilir. Bu nedenle, kanatlı rasyonlarına antioksidan maddeler veya endojen savunma mekanizmalarını güçlendiren katkı maddeleri eklenebilir (Çelebi ve ark. 2016).
Bu çalışmanın amacı bu yem katkı maddelerinin broylerler de et kalitesi üzerine etkilerinin araştırıldığı çalışmalar üzerine bibliometrik analiz sunmaktır. Bibliyometrik analiz, belirli bir konuya ilişkin araştırma yayınlarını istatistiksel ve matematiksel olarak incelenmesi sonucunda meydana gelmektedir (Demir ve ark., 2022). Literatürde bulunan çalışmaların geniş çerçeve de incelenmesi ve değerlendirilmesi için bibliometrik analiz kullanılabilmektedir. (Demir ve ark., 2024). Sosyal bilimler alanından scopus en geniş arama motoru olduğu için bibliyometrik analiz için tercih edilmiştir. (Martin- Martin A., 2018)

Çalışmanın Önemi Ve Amacı

Bu çalışma ülkemizdeki artan tavuk eti tüketimine bağlı olarak üretimde iyileştirilmelere gidilme, daha yüksek kalite ve verim hedefleme sonucunda üretimde kullanılan yem katkı maddelerinin bibliometrik inceleme olarak analiz edilmesini hedeflemektedir. Son zamanlarda yem katkı maddeleri alanındaki araştırma çalışmalarının arttığı fark edilmiştir. Bu analiz yem katkı maddelerinin et kalitesiyle ilişkisinin önemini yapılan çalışma sayıları ve verilerle ortaya koymaya çalışmaktadır. Yem katkı maddelerinin et kalitesi üzerine etkilerinin hem hayvan refahı açısından hem de tavuk gelişimi sürecinde olumlu etkilerinin görülmesinin bu alanda çalışmaları arttırdığı düşünülmektedir. Bibliometrik analiz sonuçlarıyla beraber ortaya konan veriler ile broyler yetiştiriciliğinde yeni çalışmalara katkı sunulması beklenmektedir.

Araştırmanın Soruları

Bu çalışma bibliometrik analiz ile araştırmaların yoğunlaştığı ülke, en çok atıf alan makaleler, önemli yazarlar ve yıllara göre yayın durumlarının geniş bir alanda incelenmesiyle oluşmuştur. Bu bağlamda bu analiz çalışmasında şu soruların cevaplarına ulaşmak mümkündür:

- Q1: Broiler yetiştiriciliğinde yem katkı maddelerinin et kalitesi üzerine etkisi hakkında en çok yayın yapan ülke ve yazar hangisidir?
- Q2: Broiler yetiştiriciliğinde yem katkı maddelerinin et kalitesi üzerine etkisi hakkında yıllara göre yayın analizi nasıldır?
- Q3: Broiler yetiştiriciliğinde yem katkı maddelerinin et kalitesi üzerine etkisi hakkında en çok yayın yapan dergiler hangileridir?
- Q4: Broiler yetiştiriciliğinde yem katkı maddelerinin et kalitesi üzerine etkisi hakkında yapılan araştırmalarda en çok aranan anahtar kelime nedir?
- Q5: Broiler yetiştiriciliğinde yem katkı maddelerinin et kalitesi üzerine etkisi hakkında öne çıkan üniversiteler hangileridir?
- Q6: Broiler yetiştiriciliğinde yem katkı maddelerinin et kalitesi üzerine etkisi hakkında en çok atıf alan makale ve yazar hangisidir?

Bu yazı aşağıdaki gibi organize edilmiştir. Bölüm 2 ‘de literatür taramasının analizi bulunmaktadır. Bölüm 3’te Materyol ve metod kısmından bahsedilmiştir. Bölüm 4’te çalışmanın bibliometrik analizinin ana bilgileri, araştırma konuları, araştırma boşlukları sunulmuştur. Çalışma tartışma ve sonuç bölümlerinin açıklamaları ile sonlanmaktadır.

Çalışmanın Katkıları

Bu bibliyometrik analiz, broyler yetiştiriciliğinde yem katkı maddelerinin et kalitesi üzerine etkilerinin incelenmesi üzerine yapılmış bir çalışmadır. Yem katkı maddeleri ve broyler et kalitesindeki değişimler arasındaki ilişkiye bağlı olarak bu alanda önemli katkılar sunması hedeflenmektedir. Literatürdeki çalışmaların taranması ile oluşturulan bu çalışma, bibliyometrik analiz yöntemiyle broyler yetiştiriciliği alanında yem katkı maddelerinin etkilerinin geniş kapsamda incelenmesiyle bir değerlendirilme sunulmuştur. Bu kapsamda hangi yem katkı maddeleriyle daha önce çalışıldığı, güncel olarak çalışılmaya devam eden yem katkı maddeleri ve broyler gelişiminde analiz verileri çalışmada verilerle gösterilmiştir. Bu verilere dayanarak gelecek zamanda yapılacak olan çalışmalarda daha önce çalışılmamış, son zamanlarda popüler olan konular ile ilgili yol gösterici olabileceği ve yeni çalışmalara rehberlik edebileceği düşünülmektedir.

Araştırma Boşlukları

Broyler yetiştiriciliğinde yem katkı maddelerinin kullanımı üzerine yapılan araştırmalarda aşağıdaki temel boşluklar tespit edilmiştir Bunlardan ilki 'Yem Katkı Maddelerinin Çalışma Mekanizmalarının Detaylı Olarak İncelenmesi' konusudur. Birçok çalışma yem katkılarının büyüme performansı ve et kalitesi üzerindeki etkilerini ele almıştır. Ancak, bu katkı maddelerinin moleküler düzeydeki etkileri ve bağırsak mikrobiyotasındaki değişimler gibi mekanizmaların tam olarak aydınlatılmadığı görülmektedir. Diğeri ise 'Uzun Vadeli Etkilerin İncelenmesi' konusudur. Yem katkı maddelerinin kısa zaman diliminde olumlu etkiler gösterdiği bilinmekle birlikte, uzun süreli kullanımının sağlık ve besi performans üzerindeki etkileri hakkında yeterli veri olmadığı görülmüştür. Özellikle bu konu içeriğinde katkı maddelerinin kalıntı oluşturma konusunda etkileri halen araştırılmaktadır. 'Katkı Maddeleri Kombine Kullanıldığında Ortaya Çıkan Etkiler' diğer boşluklardan biridir. Farklı yem katkı maddelerinin sinerjik ya da antagonistik etkileri üzerine yapılan araştırmalar sınırlıdır. **'**İklim ve Çevresel Faktörlerin Etkileri 'incelendiğinde çoğu çalışma kontrollü laboratuvar koşullarında gerçekleştirildiği görülmüştür. Farklı iklim şartlarında, özellikle sıcaklık stresinin yoğun olduğu bölgelerde katkı maddelerinin etkinliğini inceleyen araştırmalar yeterli görülmemiştir. Son olarak görülen boşluk ise 'Alternatif Yem Maddeleri ile Etkileşim**'** konusu olmuştur. Son zamanlarda sık kullanılmaya başlanan yem katkı maddelerinin mevcut katkı maddeleri ile etkileşimleri henüz yeterince araştırılmamıştır. Bu eksikliklerin giderilmesi, broyler yetiştiriciliğinde yem katkı maddelerinin daha etkili ve sürdürülebilir bir şekilde kullanılmasını sağlayabilir.

Literatür Taraması

Yapılan literatür taramasında yazarların bildiği kadarıyla 'Broyler Tavuklarında Yem Katkı Maddelerinin Et Kalitesi Üzerine Etkilerinin Bibliometrik Analizi' başlıklı çalışmaya benzer çalışmalara rastlanılmamış olup literatüre katkı sağlayacağı düşünülmektedir.

Tavuk yetiştiriciliğinde büyüme hızını artırmak için antibiyotiklerin yaygın olarak kullanılması, bu uygulamanın sağlık üzerindeki olumsuz etkileri nedeniyle dünya genelinde birçok ülkede yasaklanmıştır. Bu yasakların ardından, antibiyotiklerin yerini alabilecek alternatif katkı maddelerinin araştırılması hız kazanmıştır. Wickramasuriya ve arkadaşlarının (2024) bibliyometrik analizi, tavuk yetiştiriciliğinde antibiyotik büyüme destekleyicilerine alternatif ürünlerin araştırılmasında ABD'nin lider ülke olduğunu ve broyler tavukları üzerine yapılan çalışmaların ön planda olduğunu göstermektedir. Ayrıca, probiyotikler ve fitogenetikler, bu alandaki en çok araştırılan konular arasında yer almıştır.

Cesari ve arkadaşları (2024), broiler tavukları ile ilgili refah çalışmaları üzerine bir metin madenciliği analizini sunmuşlardır. Bu çalışma, broyler tavuklarının refahını artırmak için yapılan çalışmaların son on yılda artış gösterdiğini ve bu çalışmaların kesim yöntemleri gibi çeşitli parametreleri kapsadığını vurgulamaktadır. Benzer şekilde, Dinasarki ve arkadaşları (2024), broyler ürünlerinin kalitesinin pazarlama performansı üzerindeki etkisini incelemiş ve yemden yararlanma performansı ile besin takviyelerinin pazarlama stratejilerini iyileştirebileceğini belirtmişlerdir.

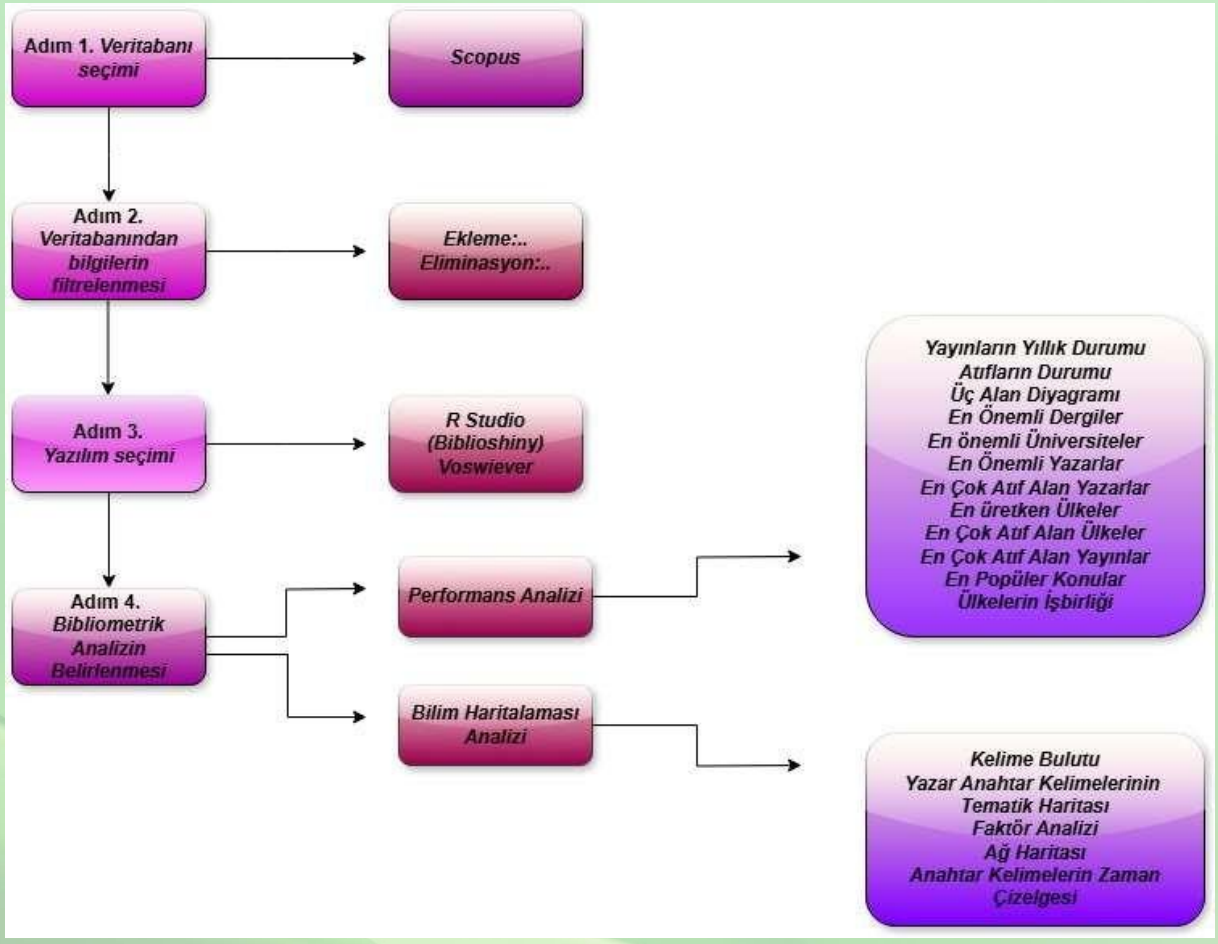
Broyler tavuklarının büyüme performansını etkileyen faktörler, dünya genelindeki pek çok çalışmanın odak noktası olmuştur. Wu ve arkadaşları (2024), broyler tavuklarının et kalitesini iyileştirmek için yeşil ceviz kabuğu ekstraktını içeren yemlerin etkisini incelemiş ve bağırsak sağlığı ile et gelişimi üzerinde olumlu etkiler gözlemiştir. Benzer şekilde, Banday ve arkadaşları (2024) Malva sylvestris yaprak tozu ilavesinin broyler tavuklarındaki büyüme performansı, bağışıklık düzeyi ve bağırsak florası üzerinde olumlu etkiler yarattığını tespit etmişlerdir.

Sıcaklık stresinin kümes hayvanları üzerindeki etkisi de önemli bir araştırma alanı olmuştur. Uyanga ve arkadaşları (2023) sıcaklık stresinin broyler tavuklarındaki büyüme performansını, bağırsak florasını ve et kalitesini olumsuz etkilediğini, gelecekte refah çalışmalarına ve et kalitesini artırmaya yönelik katkı maddelerinin kullanımının artacağını öngörmüşlerdir. Risk yönetimi ve teknoloji kullanımı da kümes hayvancılığı sektöründe önemli bir yere sahiptir.

Sharif ve arkadaşları (2023), 2002-2022 yılları arasında kümes hayvancılığındaki riskler ve teknoloji kullanımına yönelik yapılan çalışmalarda bir artış gözlemiş ve teknolojinin bu riskleri azaltmadaki öneminin giderek arttığını belirtmişlerdir. Yardibi ve Fırat (2021) ise, hayvansal üretim alanında büyüme performansının araştırılma derecesini incelemiş ve 2010 yılında en fazla yayın yapılmış yıl olduğunu, Çin'in en çok çalışmayı gerçekleştiren ülke olduğunu ortaya koymuşlardır. Çalışma, özellikle broyler tavukları, besin sindirimi ve et kalitesi parametrelerine odaklanmıştır. Mafruchati ve arkadaşları (2022), broyler tavuk embriyolarının büyümesini etkileyen hastalıklar ve virüsler üzerine yapılan çalışmaları analiz etmiş ve genetik faktörler ile virüslerin bu alandaki en önemli araştırma konuları olduğunu belirtmişlerdir.

Dinasarki ve arkadaşları (2024) çalışmasında, broyler tavuklarındaki kalite unsurlarının pazarlama stratejileri üzerindeki etkisi ele alınmıştır. Bu çalışma, Scopus veri tabanı kullanılarak 'broyler 've 'pazarlama' anahtar kelimeleriyle yapılan analiz sonuçlarına dayanır. Araştırma, broyler tavuklarının üretim süreçlerinde fiziksel koşulların, yem verimliliğinin ve besin takviyelerinin pazarlama performansını nasıl etkilediğini incelemektedir. Özellikle, kümesin fiziksel durumlarının iyileştirilmesi, yem verimliliği ve uygun besin takviyeleri kullanımının

pazarlama performansını artırabileceği sonucuna varılmıştır. Bu bulgular, broyler üretim süreçlerinde kalite iyileştirmelerinin pazarlama stratejilerinin başarısı üzerinde doğrudan etkisi olduğunu göstermektedir. Adnan ve arkadaşlarının (2024) yaptığı başka bir çalışma, sorgum araştırmalarındaki küresel eğilimleri incelemektedir. Sorgum, geleneksel olarak yem bitkisi olarak bilinse de son yıllarda farklı uygulama alanlarında da giderek daha fazla tercih edilmektedir. Çalışma, Scopus veri tabanında yapılan analizlere dayanarak, sorgumun genetik ekspresyon, bitki stres faktörleri, tahıl verimliliği, biokütle üretimi ve
metabolizma üzerine yapılan araştırmaları tartışmaktadır. Bu çalışmanın biokütle üretimi ve yem verimliliği konularında önemli katkılar sunması beklenmektedir. Özellikle, sorgumun sanayi ve tarım sektörlerinde artan kullanımının, biokütle üretimi ve yem verimliliği alanındaki araştırmalara nasıl katkı sağlayabileceği vurgulanmıştır.



Bu literatür taraması, tavuk yetiştiriciliğinde antibiyotiklerin yerine geçebilecek alternatiflerin ve broyler tavuklarının büyüme performansını artırmaya yönelik katkı maddelerinin araştırıldığını göstermektedir. Ayrıca, broyler tavuklarının refahı, et kalitesi ve sıcaklık stresi gibi konular da günümüzdeki araştırmaların odak noktasını oluşturmaktadır. Bu alandaki çalışmalar, beslenme, genetik ve çevresel faktörlerin yanı sıra, teknolojinin etkin kullanımı ile de daha verimli ve sürdürülebilir tavuk yetiştiriciliğine katkı sağlamayı hedeflemektedir. Tablo 1'de literatür taramasında kullanılan bibliometrik analizlerin tablo üzerinde gösterimi verilmiştir.

Tablo 1. Broiler Yetiştiriciliğinde Yem Katkı Maddelerinin Et Kalitesi Üzerine Etkilerinin Bibliyometrik Analizi

Yazarlar	Yıl	Anahtar Kelimeler	Zaman Aralığı	İncelenen Yayın Sayısı	Veri Tabanı	Kullanılan Yazılımlar

Materyal Ve Yöntem

Bu çalışma bibliyometrik analiz yöntemi kullanılarak yapılmıştır. Bibliyometrik analiz, bilimsel yayınların nicel analizini ve değerlendirilmesini ele alan bir disiplindir. Bu yöntem, belirli bir konu üzerindeki yayınların filtreleme yöntemleri kullanılarak birbirleriyle ile iletişim ve etkileşimlerini incelenmesinde kullanılır. (Demir ve ark., 2024a). Çalışmada, bu alanda yapılan yayınların dağılımı, en çok atıf yapılan makaleler, en çok kullanılan kelimeler en önemli yazarlar, en çok yayın yapan dergiler, ülkelerin iş birlikleri ve anahtar kelimeler değerlendirilmiştir Bibliyometrik analiz sayesinde bu zamana kadar yapılmış çalışmalar ışığında yapılacak olan yeni çalışmalara yol gösterici olabileceği hedeflenmektedir. Buna bağlı olarak broyler yetiştiriciliğinde yem katkı maddelerinin et kalitesi üzerine etkileri alanında görülebilecek araştırma boşlukları da tespit edilebilecektir.
Çalışmanın verilerine ulaşmak için Scopus veritabını kullanılmıştır. Makaleler arasında bazı filtreleme yöntemleri yapıldıktan sonra Biblioshiny paket programı ve Vosviewer paket programı ile veriler sırası ile incelenmiş ve çalışma yapılmıştır. Bu çalışmanın sırası aşağıdaki şekilde de gösterilmiştir. Aşağıda verilen Şekil 1 'de broiler', 'feed', 'supplements', 'meat quality' anahtar kelimeleri ile ilgili yapılan araştırmanın adımlarını içeren bibliyometrik analiz akış diyagramı verilmiştir.

Şekil 1. Bibliyometrik analiz akış diyagramı

Bu çalışmada, veri kaynağı olarak uluslararası bir platform olan "Scopus" tercih edilmiştir. Scopus, sosyal bilimler alanında en kapsamlı veri tabanlarından biri olarak kabul edilmekte ve karşılaştırmalı çalışmalar için birçok yazar tarafından yaygın bir şekilde kullanılmaktadır (Bashar ve ark., 2022; Hassan ve ark., 2022; Singh ve Bashar, 2021). Her ne kadar WoS ve Scopus veri tabanları temel özellikler açısından benzerlik gösterse de Scopus sosyal bilimler literatürünü kapsamlı bir şekilde indekslemesiyle öne çıkmaktadır (Ferreira ve ark., 2021). Ayrıca Scopus, dergi isimleri, h-indeks değerleri, atıf analizleri gibi bibliyometrik analizler için gerekli birçok fonksiyonu barındırmaktadır (Haque ve ark., 2020). Aşağıda Verilen Tablo 2'de Scopus veri tabanından alınan verilerin filtrelenmesi gösterilmiştir.

Tablo 2. Scopus veri tabanındaki verilerin filtrelenmesi

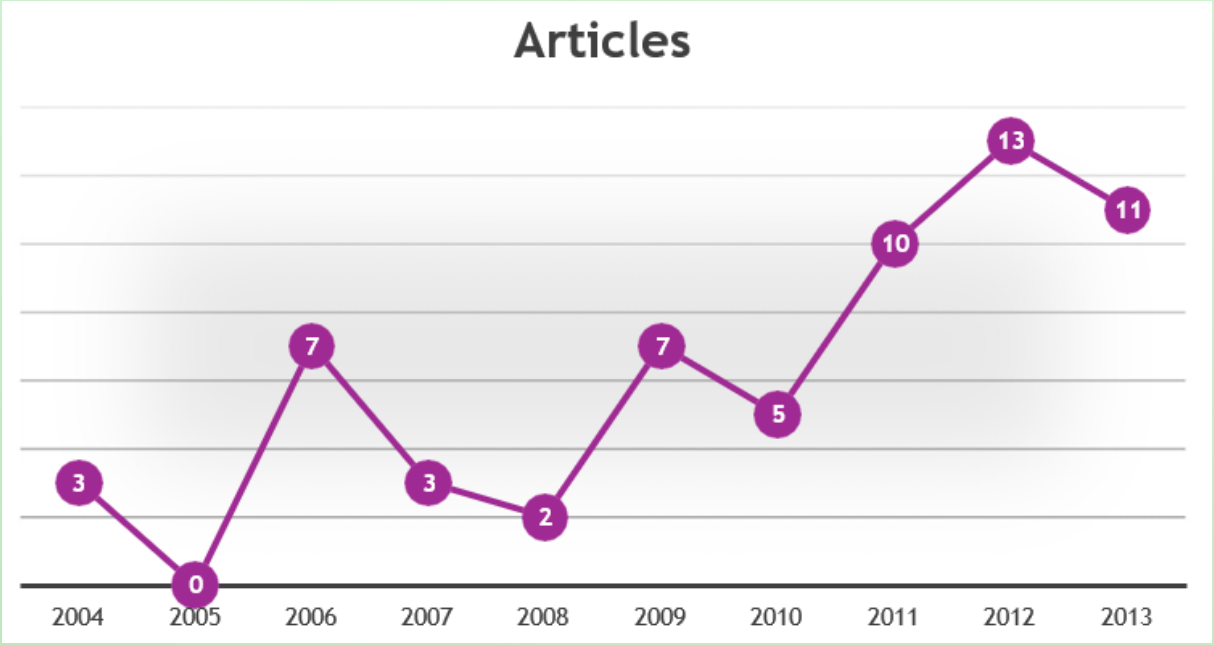
DAHİL OLANLAR	Anahtar kelimeler : Broiler', 'feed', 'supplements', 'meat quality' Belge Türü : Makale Yayın Dili : İngilizce Yayın Şekli : Dergi Yayın Yılı: 2004-2024
DAHİL OLMAYANLAR	Ön baskı web sitelerinde yayınlanan inceleme ve konferans bildirileri, kitap bölümleri, makaleler veya incelemelerin yanı sıra yorumlar, başyazılar ve mektuplar

Broiler', 'Feed', 'Supplements', 'Meat Quality' İle İlgili Çalışmaların Bibliometrik Analiz Sonuçları

Çalışmanın ana kütlesini 536 doküman oluşturmaktır. Çalışmada 2004-2024 yılları arasında 'broiler, supplements, meat quality, chicken' anahtar kelimeleri ile filtrelemeler sonucunda örneklem sayısı 487 olmuştur.

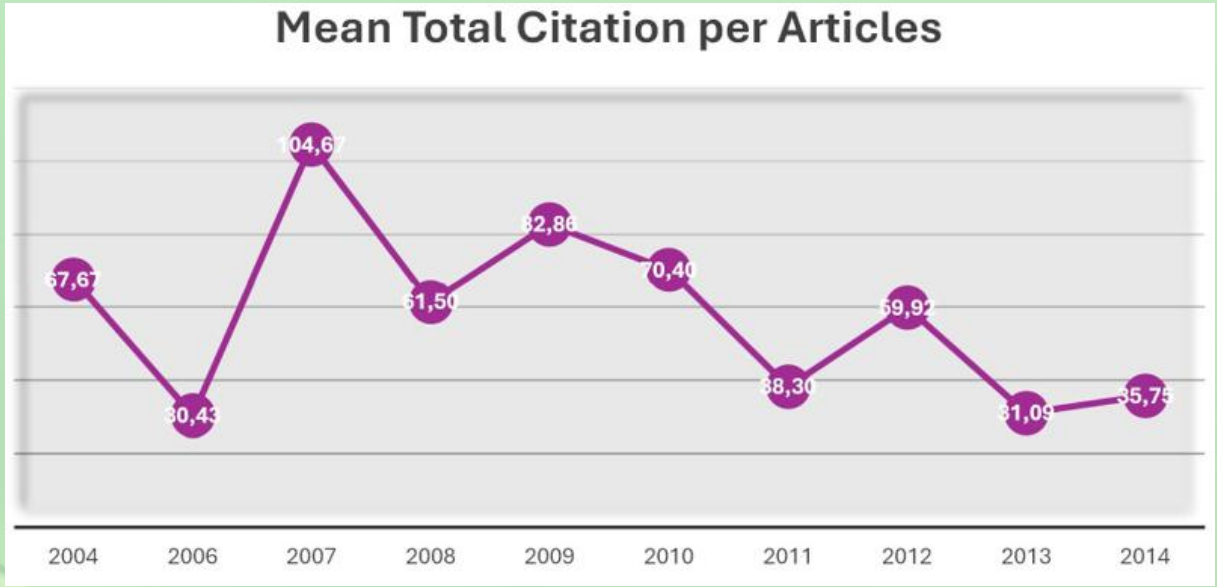
Performans Analizi

Aşağıdaki Şekil 2'de bibliyometrik analizin ana bilgilerinden oluşan tablo verilmiştir. 2004-2024 yılları arasında yapılan çalışmalara 119 dergide ve 487 makalede ulaşılmıştır. 'Broiler', 'feed', 'supplements', 'meat quality' anahtar kelimeleri ile 2160 yazar çalışma yapmış ve bu yazarların 5'i tek başına literatüre katkı sağlamıştır. Yayınların yıllık büyüme oranı % 16,89, uluslararası yazarların iş birliği %22,38 ve bir eserin ortalama yaşı 4,95 yıl olarak tespit edilmiştir.



Şekil 2. Ana Bilgiler

Yayınların Yıllık Durumu

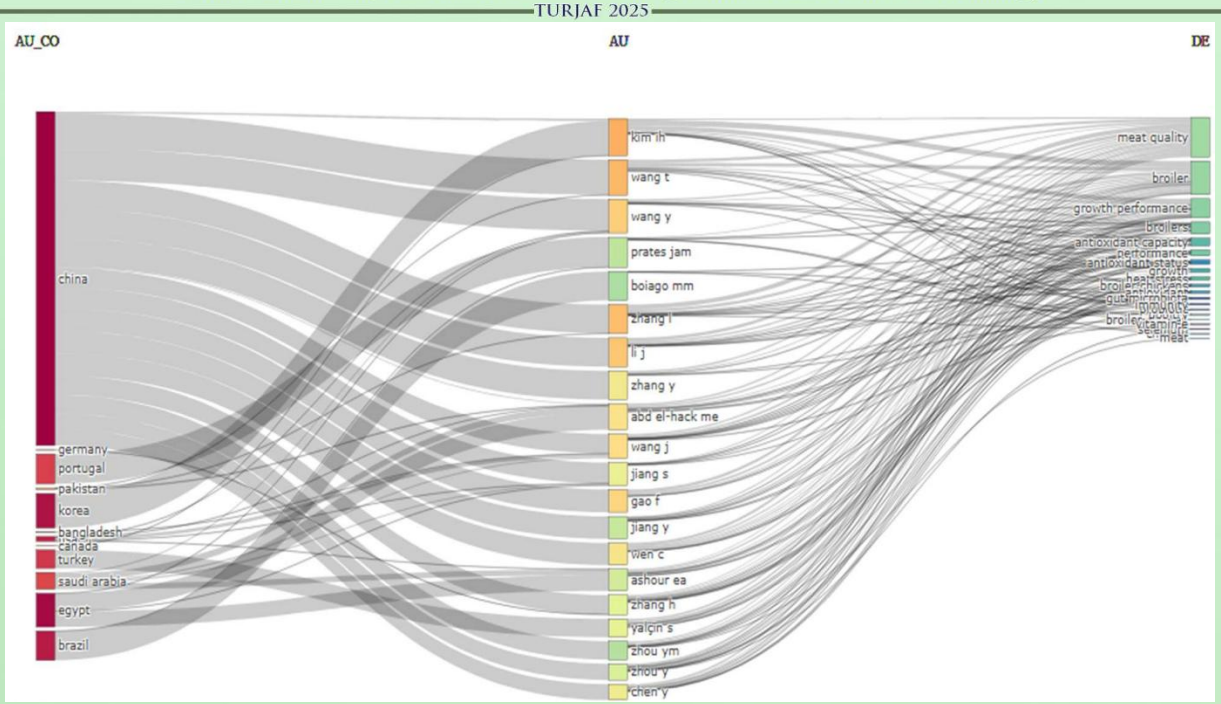


Yayınların yıllık durumuna göre yayımlanma sayıları aşağıdaki Şekil 3'te verilmiştir. Şekil 3 'de 2004-2024 zaman aralığında 2013 yılında 11 makale, 2012 de 13 makale 2011 yılında 10 makalenin literatüre kazandırıldığı görülmüştür.

Atıfların Durumu

Aşağıda verilen Şekil 4 'te yılları göre makalelere yapılan atıf sayıları gösterilmiştir. Yayınlara yapılan atıfların yıllık durumları grafiğe göre değişen bir eğilim göstermektedir. 2004 yılında yayınlara % 67,67 atıf yapıldığı görülürken 2014 yılında %37,75'lik bir atıf oranının mevcut olduğu görülmüştür. Bu değişimin nedeni 'broiler', 'feed', 'supplements', 'meat quality' anahtar kelimeleri ile bu konuyla ilgili yapılan araştırmaların değişiklik gösterdiği görülmektedir.

Şekil 3. Yayınların Yıllık Durumu



Şekil 4. Atıfların Durumu

Üç Alan Diyagramı

Aşağıda verilen Şekil 5'te Sankey diyagramı olarak da literatüre geçen üç alan diyagramı verilmiştir. Sankey diyagramı olarak da bilinen bu üç alan diyagramında üç parametre karşılaştırılmıştır. Biblioshiny ara yüzünün sağladığı avantaj ile yazar, ülke ve anahtar kelime parametreleri çalışılmıştır. Diyagramdaki dikdörtgenlerin büyüklüğü analize tabi olan parametrenin önemini göstermektedir. En önemli ülke Çin, en önemli yazar Kim ih, en önemli kelime 'meat quality'dir.

En Önemli Dergiler

Aşağıda oluşturulan Tablo 3'te broiler', 'feed', 'supplements', 'meat quality' anahtar kelimeleri ile ilgili araştırma yapan ve yayımlanan en önemli dergiler verilmiştir

En Üretken Ülkeler

Aşağıdaki Şekil 6'da broiler, feed, supplements ve meat quality anahtar kelimeleri ile ilgili yapılan çalışmada en çok ürüne sahip olan ülkeler renk dağılımı ile gösterilmiştir. Buna ek olarak ülkelerin yayın sıklığı ve sırası da sol taraftaki tablo da görülmektedir. Şekil 6' da ülkelerin üretkenliği verilmiştir. Dünya haritasındaki lacivert renk en çok çalışma yapan ülkeleri temsil eder. Mavi ve tonları daha az sayıda çalışma yapan ülkeleri, gri renk ise hiç çalışma yapmayan ülkeleri temsil eder (Demir ve diğerleri,2024'a). Şekil 8 in içindeki tabloya göre Çin 884 makale ile birinci sırada, Mısır 201 makale ile ikinci sırada, Güney Kore 196 makale ile üçüncü sırada yer almaktadır.

Şekil 6. En Üretken Ülkeler

En Çok Atıf Alan Ülkeler

Aşağıda verilen Tablo 7'te en çok atıf alan ülkeler sıralanmıştır. Tablo 7'de görüldüğü gibi Çin 3154 makale ile birinci sırada, Kore 1234 makale ile ikinci sırada, Amerika Birleşik Devletleri ise 725 makale ile üçüncü sırada yer almaktadır.

Tablo 7. En Çok Atıf Alan Ülkeler

En Çok Atıf Alan Makale

Aşağıda verilen Tablo 8'da en çok atıf alan makaleler, yazarları, yayınlandıkları dergiler ve atıf sayıları verilmiştir. Jiang vd.,2007 yılında Poultry Science dergisinde yayınlanan 'Effects of soybean isoflavone on growth performance, meat quality, and antioxidation in male broilers' makalesi 195 atıf alarak ilk sırada yer almıştır. Daha sonra Jung vd., 2010 yılında Meat Science dergisinde 'Effect of dietary mixture of gallic acid and linoleic acid on antioxidative potential and quality of breast meat from broilers' makalesi ile 191 atıf alarak ikinci sırada yer almıştır. Hwangbo vd.,2009 yılında Journal of Environmental Biology isimli dergide yayınlanan 'Utilization of house fly-maggots, a feed supplement in the production of broiler chickens' adlı makale ile üçüncü sırada yer almaktadır.

Tablo 8. En Çok Atıf Alan Makale

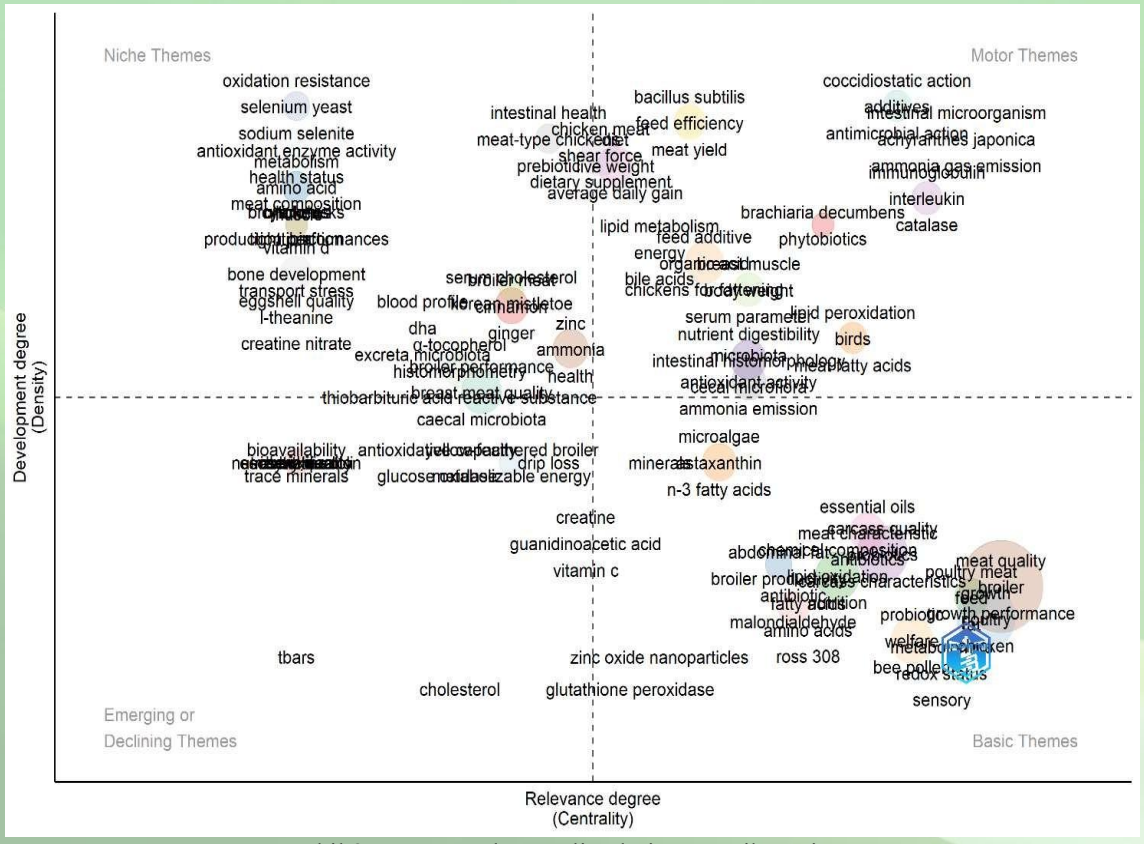
Kelime Bulutu

Şekil 7'de çalışmalarda en çok kullanılan kelimelerden oluşan kelime bulutu verilmiştir. Şekil 7 'de araştırmalarda en çok kullanılan kelimelerin kullanım sıklığın yazı büyüklüğüyle orantılı olarak görülmektedir. Buna göre en çok kullanılan kelimeler; diet, chickens, animal feed, dietary supplement ve meat olmuştur.

Popüler Konular

'Meat' kelimesi 2017 yılının birinci çeyreğinde, 2020'in ikinci çeyreğinde ve 2022' in üçüncü çeyreğinde 684 kere kullanılarak önemli kelime olmuştur. 'Diet' kelimesi 2018 yılının birinci çeyreğinde, 2020 yılının ikinci çeyreğinde ve 2023 yılının üçüncü çeyreğinde 588 kere kullanılarak ikinci sırada yer almaktadır. 'Male' kelimesi ise 2017 yılının ilk çeyreğinde, 2020 yılının ikinci çeyreğinde ve 2023 yılının üçüncü çeyreğinde 477 kere kullanılarak üçüncü sırada yer almıştır. 'Gallus gallus' kelimesi 2024 yılı itibariyle halen aktif olarak kullanılmaktadır. Aşağıdaki Tablo 9'de bu alanda tercih edilen popüler konuların yıllara göre sıklığı verilmiştir.

Yazar Anahtar Kelimelerin Tematik Harita

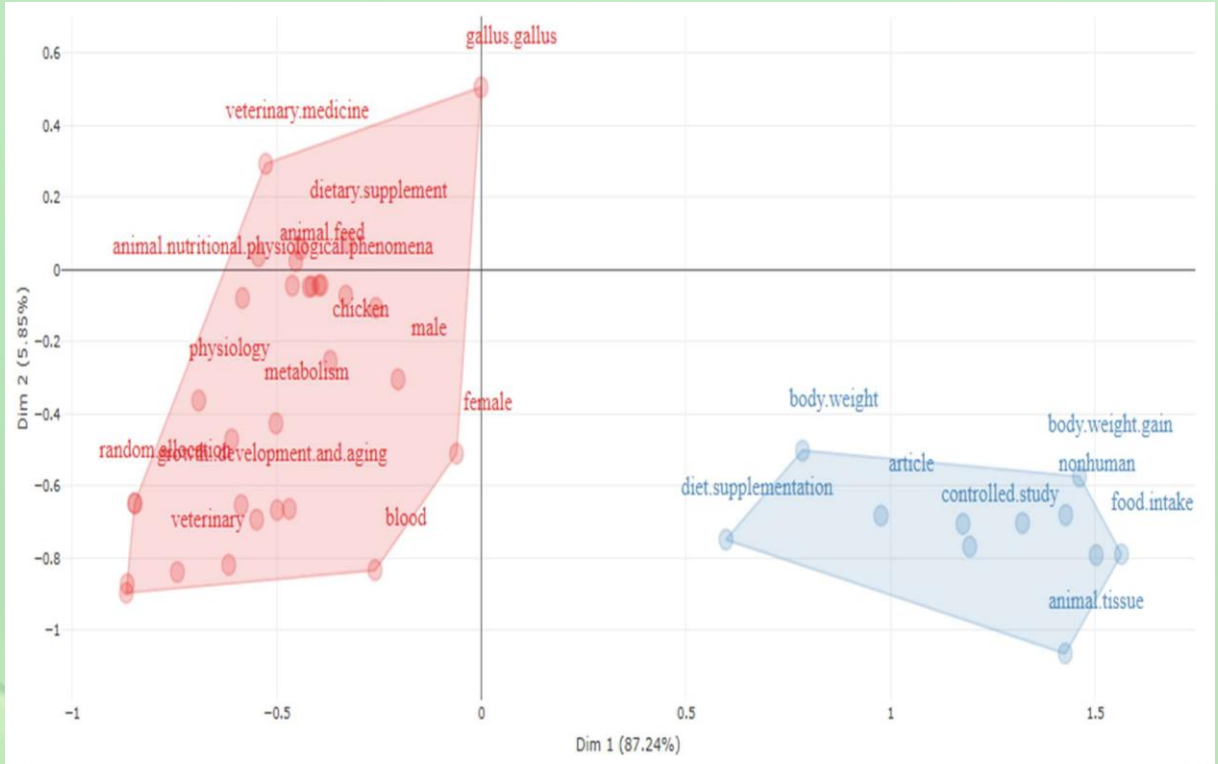


Aşağıda verilen Şekil 8 'de yazarların kullandığı anahtar kelimelerin tematik olarak haritalanmış hali verilmiştir. Şemada yer alan motor tema bölümündeki kümeler, incelenen anahtar kelimenin en temel çalışma alanlarına ait kümeleri göstermektedir. Şemanın temel tema bölümündeki kümeler ise ilgili anahtar kelimenin temel bir yapıda olduğunu ve dönüşüm geçirdiğini, diğer bir deyişle, gelişimini sürdüren kümeleri ifade etmektedir.

Şekil 7. Kelime Bulutu

Tablo 9. Popüler Konular

Term	Frequency	Year (Q1)	Year (Q2)	Year (Q3)
Meat	634	2017	2020	2022
Diet	588	2018	2020	2023
Male	477	2017	2020	2023
Dietary supplement	304	2019	2021	2023
Chicken	278	2015	2019	2021
Veterinary medicine	209	2020	2022	2023
Metabolism	195	2016	2019	2021
Physiology	160	2016	2019	2022
Growth, development and aging	156	2014	2018	2020
Gallus gallus	137	2014	2023	2024

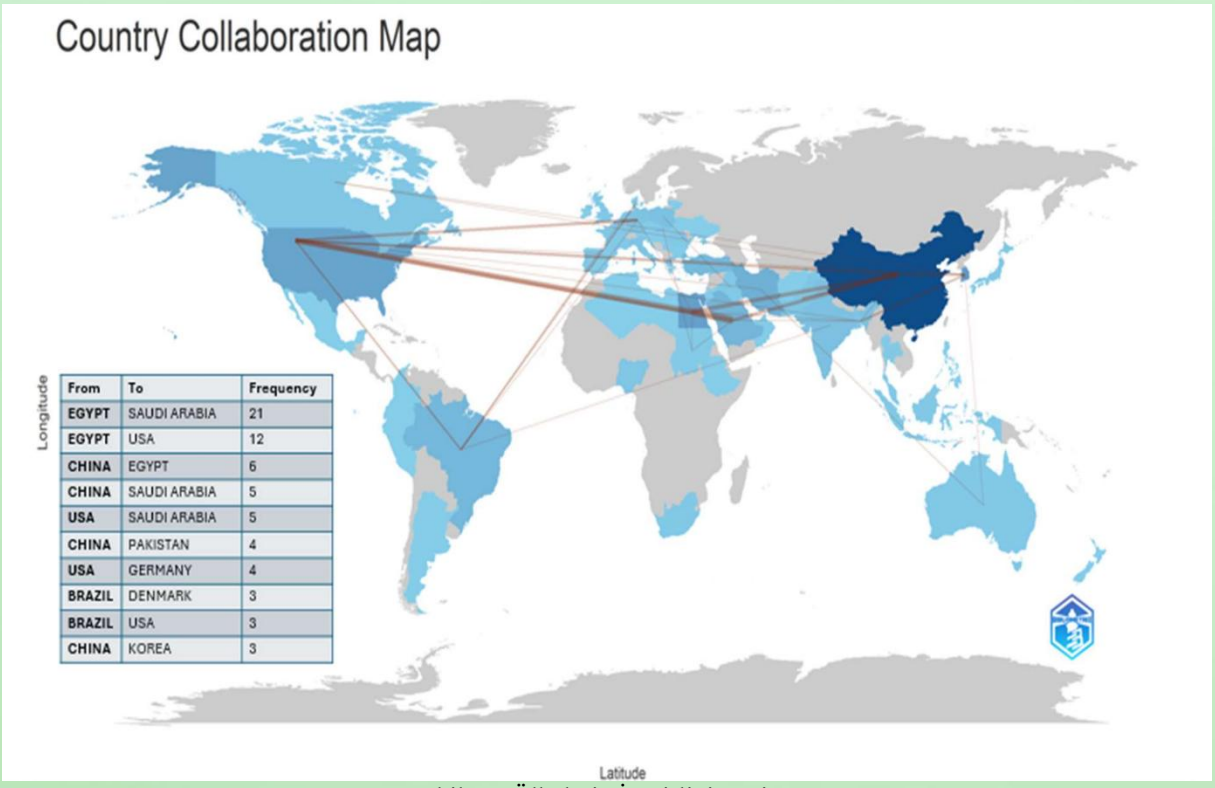


Şekil 8. Yazar Anahtar Kelimelerin Tematik Haritası

Yeni ortaya çıkan veya gerileyen temalar bölümü, yeni ortaya çıkan ya da azalan anahtar kelimeleri gösterirken, niş temalar bölümü ise oldukça fazla sayıda çalışma yapılmış ancak diğer çalışmalardan izole kalmış anahtar kelimeleri içermektedir. Bu nedenle, incelenen anahtar kelimenin hangi bilimsel çalışmalar ile öne çıktığını anlamak için şemanın temel tema ve motor tema bölümlerinin ele alınması gerekmektedir. Motor temada; phytobiotics, meat yield, lipid metabolism, Niche temada; anatioxidant, enzyme activity, creatinin nitrate, amino acid Emergeging temada; cholesterol, bioavabilabity tbars, Basic temada; ise N-3 fatty acids, sensory ve essential oils kelimeleri karşımıza çıkmaktadır.

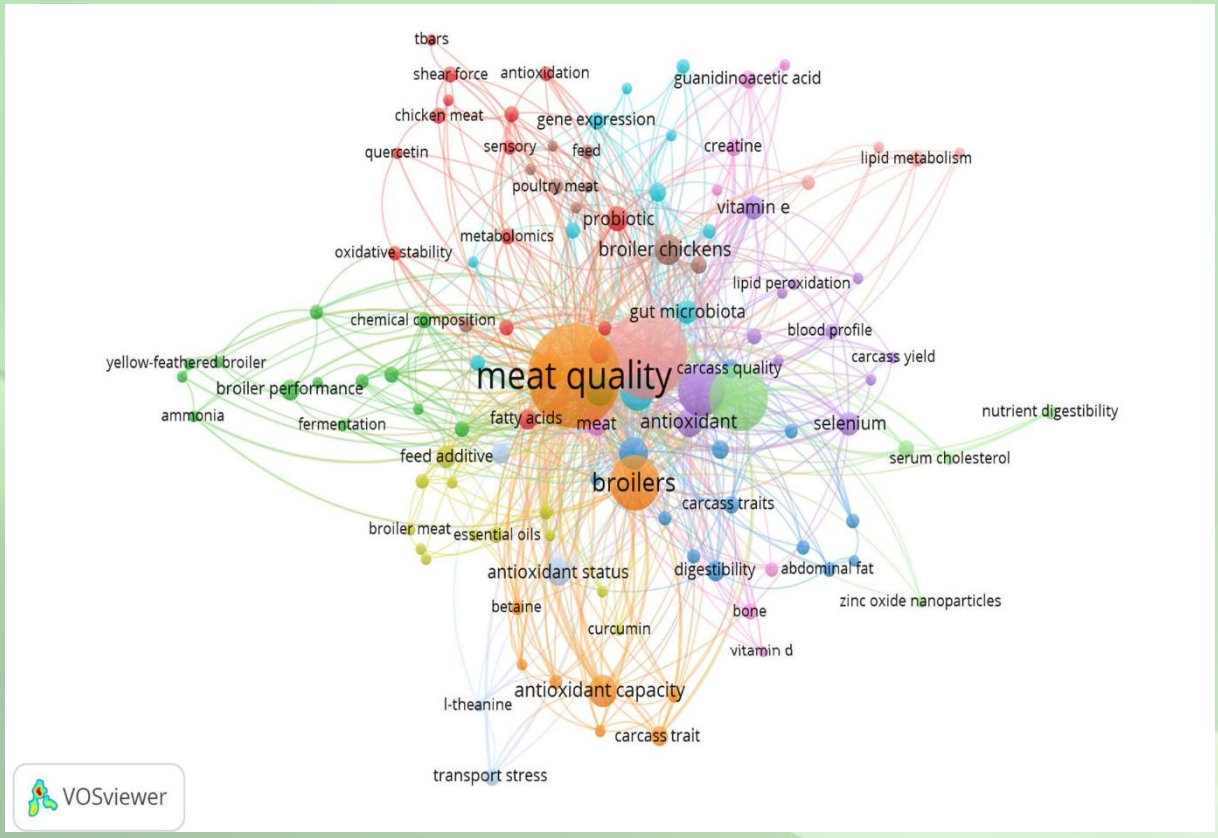
Faktör Analizi

Aşağıda verilen Şekil 9 'da kullanılan kelime kümeleriyle oluşturulan faktör analiz verilmiştir. Faktör analizi, çok değişkenli veri setlerindeki karmaşıklığı azaltmak ve gizli yapıları ortaya çıkarmak için kullanılan istatistiksel bir tekniktir. Bu yöntem, bir veri setindeki değişkenler arasındaki ilişkileri anlamak ve veri setini daha anlaşılır ve yönetilebilir hale getirmek amacıyla kullanılır. Faktör analizi genellikle faktör yükleri olarak adlandırılan katsayılarla ifade edilir. Faktör yükleri, değişkenlerin hangi faktörlerle ilişkili olduğunu ya da belirli değişkenler arasındaki ortaklığı hangi faktörlerin açıkladığını gösterir. Faktör yüklerine göre kırmızı kümede; blood, veterinary medicine, gallus gallus kelimeleri toplanmıştır. Mavi kümede ise body weight, diet supplementation, animal tissue, food intake kelimeleri yer almıştır.



Şekil 9. Faktör Analizi

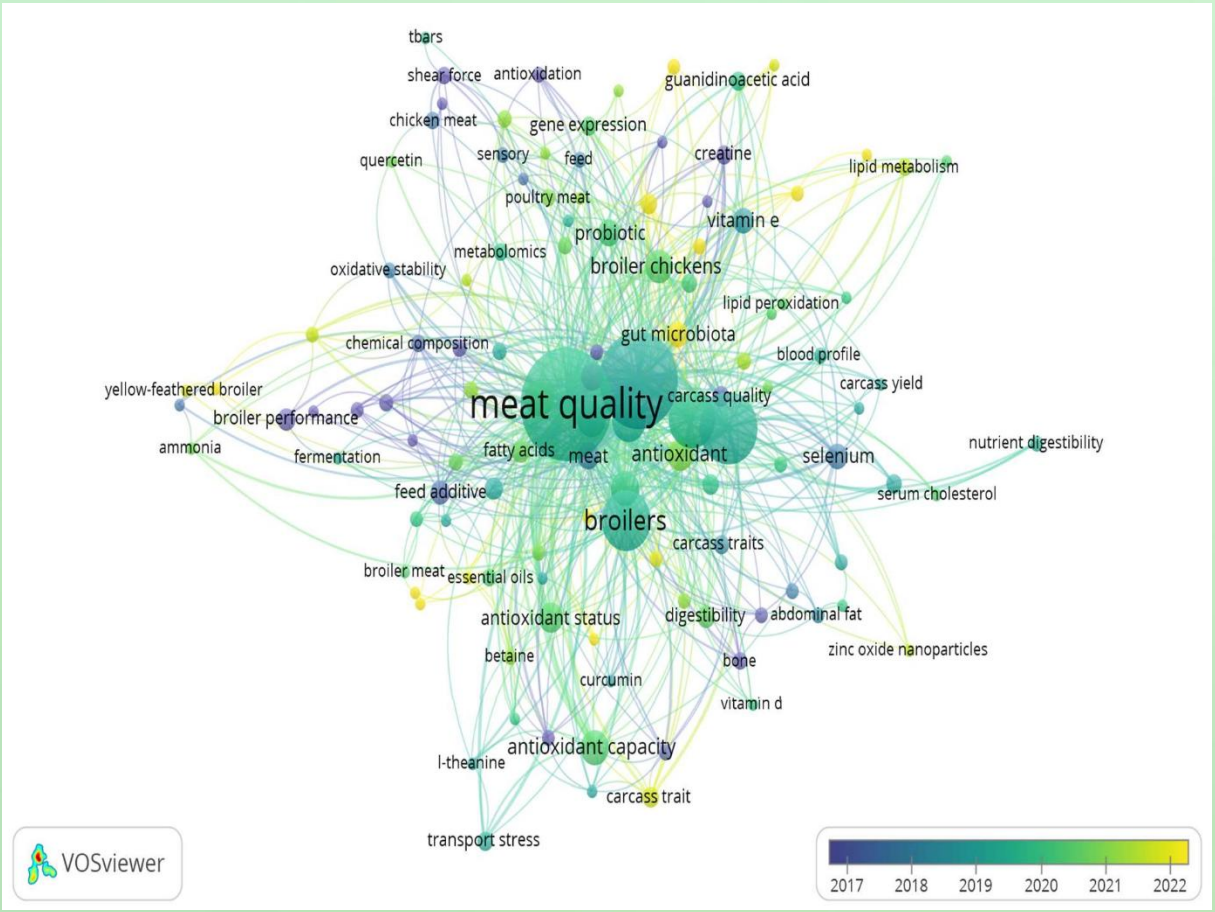
Ülkelerin İş Birliği Haritası



Şekil 10'da yapılan çalışmalarda iş birliği yaparak ilerleyen ülkeler ve bu ülkelerin çalışma sıklığı hem şekil hem tablo olarak verilmiştir. Ülkeler arasındaki iş birliği haritasında kalın kahverengi çizgiler daha çok iş birliği yapıldığını ince kahverengi çizgiler daha az iş birliği yapıldığını göstermektedir. Mısır ve Suudi Arabistan 21 makale ile en çok iş birliği yapan ülkeler arasında birinci sırada yer almaktadır. Mısır ve Amerika Birleşik Devletleri 12 makale ile iş birliği yapan ülkeler arasında ikinci sırayı alırken Çin ve Mısır 6 makale ile üçüncü sırada yer almaktadır. Çin iş birliği yapan ülkeler arasında dünyanın en iyi ülkesi olmuştur.

Ağ Haritası

Aşağıda verilen Şekil 11'de anahtar kelimeler ile oluşturulan ağ haritası verilmiştir. Yukarıda görülen anahtar kelime ağ haritası çalışmasını 12 küme oluşturmuştur. Her renk farklı anahtar kelimeyi temsil etmektedir. Kullanılan çeşitli renklere bakılarak farklı konuların çalışışdığı görülmüştür. Buna göre en önemli üç kelime 'Meat quality, broiler, growth performance' olmuştur.



Şekil 10. Ülkelerin İş Birliği Haritası

Şekil 11. Ağ Haritası

Anahtar Kelimelerin Zaman Çizelgesi

Aşağıda verilen Şekil 12'de zaman dağılımına göre kullanılan anahtar kelimeler verilmiştir. Yukarıdaki şekilde feed additive, chicken meat ve feed kelimelerinin daha sık çalışıldığı görülmüştür. Halen literatürde aktif olarak gut microbiata, broiler meat, carcass trait, lipid metobolism, essantial oils gibi kelimeler kullanılmaktadır.

Şekil 12. Anahtar Kelimelerin Zaman Çizelgesi

Tartışma

Scopus veri tabanı üzerinde yapılan bir tarama sonucunda, ilgili zaman aralığında 'broiler', 'feed', 'supplements', 'meat quality' anahtar kelimeleri ile yayınlanmış ingilizce dilindeki 487 makale tespit edilmiştir. Makalelerin ortalama yaşı 4,95 yıl, belge başına düşen atıf oranı 2014 yılında %37,75 olarak belirlenmiştir. Çalışmalarda yer alan toplam 2160 yazardan 5'i tek yazarlı makalelerde çalışmıştır. Üç Alan Grafiği'ne göre en üretken ülke "Çin", en öne çıkan yazar "Kim Ih.", en sık kullanılan anahtar kelime ise "meat quality" olarak belirlenmiştir.

Bu çalışma, 'broiler', 'feed', 'supplements', 'meat quality' anahtar kelimeleri ile en üretken yazarları, referans alınan makaleleri, kuruluşları, ülkeleri ve akademik alanları belirlemeye yönelik yapılan bibliyometrik çalışmalar arasında yer almaktadır. Çalışmada Scopus veri tabanında indekslenen makaleler incelenmiştir. Makalelerin çoğunun açık erişim olması nedeniyle bu alanda katkıda bulunan yazar sayısı hızla artmakta ve çalışmaları geniş bir şekilde yayımlanmaktadır. Önceki araştırmalara göre, bu alanda en fazla akademik çalışma üreten ülkeler sırasıyla Çin, Mısır ve Güney Kore olup, en çok atıf alan ülkeler ise sırasıyla Çin, Kore ve Amerika Birleşik Devletleri olmuştur.

En üretken dergiler sırasıyla Poultry Science, Brıtısh Poultry Scıence Tropical Animal Health And Productıon olmuştur. Çalışmamızda, konu ile ilgili en çok çalışmaya sahip olan ya da yazarlarının bağlı olduğu kurumun "'Nanjıng Agrıcultural University' olduğu belirlenmiştir. En çok yayın yapan yazar ise 602 makale ile yine "Kim Ih." olarak kaydedilmiştir. En üretken belge, Jiang vd.,2007 yılında Poultry Science dergisinde yayınlanan 'Effects of soybean isoflavone on growth performance, meat quality, and antioxidation in male broilers' makalesi 195 atıf alarak listeye girmiştir.

Anahtar kelime analizi sonucunda, eleman sayısına göre en büyük küme "Meat" olarak adlandırılmıştır. Buna göre en önemli üç kelime 'Meat quality, broiler, growth performance' olmuştur.

Bu çalışmada bilimsel haritalar kullanılarak, 'broiler', 'feed', 'supplements', 'meat quality' alanındaki ilgili araştırmalarda ana eğilimler ve bulgular genel bir bakış açısıyla sunulmuş, yazarların çalışmalarını etkileyen temel temalar, konular ve entelektüel yapılar tanımlanmıştır. Faktör yüklerine göre kırmızı kümede; blood, veterinary medicine, gallus gallus kelimeleri toplanmıştır. Mavi kümede ise body weight, diet supplementation, animal tissue, food intake kelimeleri yer almıştır.

Anahtar kelimelerinin zaman çizelgesi dikkate alındığında, bilimsel araştırmalarda öne çıkan kavramlar; feed additive, chicken meat ve feed kelimelerinin daha çok ön plana çıktığı görülmüştür. Halen literatürde aktif olarak gut microbiata, broiler meat, carcass trait, lipid metobolism, essantial oils kelimeleri yazarlar tarafından çalışılmakta olduğu görülmüştür.

Sonuç

Bu çalışmada, bilimsel başarılar, 'broiler', 'feed', 'supplements', 'meat quality' anahtar kelimeleri ile Scopus veri tabanından elde edilen veriler kullanılarak analiz edilmiş ve değerlendirilmiştir. En iyi araştırmacılar seçilmiş, bölgesel dağılımlar ve yayınlar haritalandırılmıştır. Hem üretilen makale sayısı hem de atıf açısından Çin, en üretken ülke olarak belirlenmiştir. 'Broiler', 'feed', 'supplements', 'meat quality' anahtar kelimeleri ile ilgili makalelerin bibliyometrik değerlendirmesinde, en çok yayın yapan yazar "Kim Ih.", en çok yayınlanan dergi " Poultry Science ", Poultry Science dergisinde yayınlanan 'Effects of soybean isoflavone on growth performance, meat quality, and antioxidation in male broilers' makalesi 195 atıf alarak ilk sırada yer almıştır. Yazarların en önemli anahtar kelimeleri arasında "meat", "diet" ve "male" yer almaktadır. 'Broiler', 'feed', 'supplements', 'meat quality' anahtar kelimeleri ile yapılan araştırmaların kapsamlı bir şekilde özetlenmesiyle, yine bu alanda yeni çalışma alanlarının ve bakış açılarının geliştirilmesine olanak sağlanacağı öngörülmektedir.

Gelecekteki çalışmalar için yönetsel çıkarımlar şu şekilde ifade edilmiştir:

Bu araştırma, mevcut literatürdeki en etkili kaynakları, yazarları, ilişkileri, ülkeleri ve çalışmaları belirleyerek 'broiler', 'feed', 'supplements', 'meat quality' anahtar kelimeleri ile ilgili kritik bilgilerine katkı sağlamaktadır. Uygulayıcılar ve araştırmacılar, hangi makalelerin atıf alacağına, hangi çalışmaların vurgulanacağına ve 'broiler', 'feed', 'supplements', 'meat quality' anahtar kelimeleri ile en büyük etkiye sahip çalışmaların hangileri olduğuna bu bilgiler ışığında karar verebilir.

Bu bibliyometrik çalışma, 'broiler', 'feed', 'supplements', 'meat quality' anahtar kelimeleri ile ilgili önceki ve mevcut araştırmaları ile gelecekteki potansiyel araştırma fırsatlarına kapsamlı bir genel bakış sunmaktadır. Bu anahtar kelimelerin incelenmesi alanında yapılan çalışmaların kapsamlı bir şekilde anlaşılması, akademisyenler için bir referans niteliği taşımaktadır.

Atıflar ve ortak atıflar, araştırmacıların entelektüel yapısını oluşturan birçok araştırma akımını veya disiplini belirlemek için kullanılabilir. Bu yöntem, temaları tespit etmeye ve bilgi edinmeye yardımcı olmaktadır.

Bu çalışma, 'broiler', 'feed', 'supplements', 'meat quality' anahtar kelimeleri ile ilgili çalışmaları incelemek ve hem teorik hem de pratik uygulamalar açısından ileri düzey araştırma alanlarını belirlemek için önemli bilgiler sağlamaktadır. Bu yönüyle hem akademisyenlere hem de uygulayıcılara rehberlik edebilecek bir kaynak niteliği taşımaktadır.

Scopus veri bankası kullanılarak yapılan bu çalışmada 2004-2014 yıllarını içerdiği için ve biblioshiny ve VOSviewer programları kullanılarak filtrelemeler yapılarak sınırlandırılmalar yapılmıştır. Her ne kadar bu analiz Scopus veri tabanına odaklanmış olsa da Web of Science, VOSviewer, R, RStudio gibi diğer veri tabanları da alternatifler arasında yer almaktadır.

Ayrıca, daha ayrıntılı veri kapsamı içeren bir haritalama aracı geliştirilmesi de bir seçenek olarak değerlendirilebilir. Gelecek çalışmalarda, halen literatürde aktif olarak gut microbiata, broiler meat, carcass trait, lipid metobolism, essantial oils kullanılan anahtar kelimeleri üstüne yapılacak olan çalışmalarla literatüre yeni bilgiler katılacağı ön görülmektedir.

Abstract

Cold plasma (CP) technology is gaining recognition as a promising approach in the food industry for preserving the stability and bioactivity of carotenoids. These pigments, abundant in plants and microorganisms, are essential for human health due to their potent antioxidant properties but cannot be synthesized by the human body. CP treatment produces reactive gases by generating plasma at low temperatures, which can inactivate microorganisms and modify enzymatic activity in food systems. The effects of CP on carotenoids are influenced by key parameters such as voltage, treatment duration, type of gas used, and the specific food matrix. CP has the potential to enhance carotenoid content by facilitating their release from cellular structures. However, it may also trigger oxidative reactions that degrade carotenoids under certain conditions. For example, CP treatment has been shown to improve the brightness and redness of carrot juice but reduce its carotenoid content. Conversely, in fruits such as mango, CP can enhance the preservation of carotenoid content during storage. Similarly, in tomatoes, CP treatment has been reported to either increase or decrease lycopene content, depending on the processing conditions. The advantages of CP include its ability to extend the shelf life of carotenoids, its energy efficiency, and its low environmental footprint. Despite these benefits, challenges persist in scaling up CP technology for industrial applications and optimizing its processing parameters. Future research should focus on elucidating the effects of CP on carotenoid stability across diverse food matrices and unlocking the full potential of this innovative technology in the food industry.

Extraction of Anthocyanins from Food Waste Using Ultrasound- and Microwave-Assisted Methods

Neslişah Okur[1]*, Senem Kamiloglu[1,2]

[1]Department of Food Engineering, Faculty of Agriculture, Bursa Uludag University, 16059 Gorukle, Bursa, Türkiye
[2]Science and Technology Application and Research Center (BITUAM), Bursa Uludag University, 16059 Gorukle, Bursa, Türkiye
**E-mail: 502408002@ogr.uludag.edu.tr*

Abstract

Anthocyanins are natural plant pigments responsible for the vibrant red to blue-purple colors in various foods and beverages. They are found abundantly in fruits such as blackberries, blueberries, and strawberries, as well as vegetables like red cabbage and eggplant. Beyond their role as natural colorants, anthocyanins are valued for their significant health benefits. This study explores the definition, sources, biological activities, and applications of anthocyanins in the food industry, with a specific focus on two innovative extraction techniques: ultrasound-assisted extraction (US) and microwave-assisted extraction (MW). US and MW represent advanced, eco-friendly alternatives to conventional extraction methods, offering enhanced speed and efficiency. MW utilizes microwave energy to rapidly heat solvents and plant material, enabling swift extraction, reduced solvent usage, and energy efficiency. However, the technique presents challenges, such as thermal degradation of heat-sensitive compounds and limited compatibility with non-polar solvents. US employs ultrasonic waves to create cavitation, facilitating high extraction yields within shorter timeframes. Several studies highlight the superior performance of US and MW in extracting anthocyanins from food waste. These methods deliver higher yields, reduced extraction times, and lower solvent consumption compared to traditional techniques. By enabling the recovery of valuable bioactive compounds from food waste, these approaches promote sustainable food production systems. Nevertheless, certain limitations persist, including the co-extraction of unwanted compounds, the potential formation of toxic by-products, and the heat sensitivity of anthocyanins. Additionally, scaling up laboratory findings to industrial applications remains a challenge. Overall, US and MW hold immense promise as sustainable and efficient extraction techniques for the food industry. Addressing their limitations through further research and development will pave the way for broader applications and advancements in sustainable food systems.

High-Throughput Phenotyping of Exotic Tomato Germplasm For Fruit Size, Shape, and Color Diversity

Adil Hussain, Muhammad Daniyal Junaid, Javaria Tabassum, Muhammad Arshad Javed

Department of Plant Breeding and Genetics, University of the Punjab, Lahore, 54590, Pakistan
***For correspondence**: mdaniyaljunaid@gmail.com*

Abstract

Tomato (*Solanum lycopersicum* L.) is a globally important crop known for its nutritional value and culinary versatility. Consumer preferences for tomatoes are largely influenced by fruit shape, size, and color, making these traits essential targets in breeding programs. This study utilized high-throughput phenotyping to evaluate fruit morphological traits across 81 tomato genotypes using Tomato Analyzer software. The software quantified 47 parameters, including fruit size, shape indices, blockiness, asymmetry, end shapes, angles, eccentricity, and color, through machine learning and geometrical techniques. Conducted at the University of Punjab, Quaid-e-Azam Campus, Lahore, data were extracted from images of fully mature tomato fruits. The results revealed significant phenotypic diversity among genotypes. The first two principal components explained 75.6% of total variance, with PC1 (50.2%) representing a gradient from small, elongated fruits to large, round fruits, and PC2 (25.4%) capturing variations in fruit end shapes and internal structures. Strong correlations between size parameters and shape indices suggested potential inverse relationship for these traits. This study highlighted the efficiency of high-throughput phenotyping in characterizing complex fruit traits, offering a significant improvement over traditional method. The identified morphological diversity provides a valuable resource for breeding programs aimed at developing market-specific tomato cultivars. Moreover, this comprehensive dataset lays the foundation for genetic studies on fruit morphology, facilitating advancements in tomato crop improvement.

Impact of Ultrasonication on Phase Separation and Sensory Attributes of Tahini

Melek Tuna, Fatmanur Çakiroglu, Fahriye Acar, Eda Adal, Tugba Aktar

Alanya Alaaddin Keykubat Üniversitesi, Mühendislik Fakültesi Gıda Mühendisliği Bölümü, Alanya, Türkiye
***For correspondence**: tugba.aktar@alanya.edu.tr*

Abstract

Tahini is a widely consumed traditional product due to its high nutritional value. However, sesame oil, which makes up 55-60% of tahini, separates from the solid components during storage, causing phase separation, which is undesirable for consumers. This study investigated the effectiveness of ultrasound technology in preventing phase separation in tahini. Two different batches of Bozkır tahini with Geographical Indication (produced from hulled and unhulled sesame seeds) were subjected to 35 kHz ultrasound for different durations (1-30 minutes). The results of this study suggest that the application of ultrasound has the potential to improve the stability of tahini and maintain its quality.

Key Words: *tahini, tahiniultrasound, ultrasound technology, phase separation*

Ultrasonikasyonun Tahinin Faz Ayrımı ve Duyusal Özellikleri Üzerindeki Etkisi

Özet

Tahin, yüksek besin değeri nedeniyle yaygın olarak tüketilen geleneksel bir üründür. Ancak tahinin %55-60'ını oluşturan susam yağı, depolama sırasında katı bileşenlerden ayrılarak faz ayrımına neden olur ve bu da tüketiciler için istenmeyen bir durumdur. Bu çalışmada tahinde faz ayrılmasını önlemede ultrason teknolojisinin etkinliği araştırılmıştır. Coğrafi İşaretli Bozkır tahininin iki farklı partisi (kabuklu ve kabuksuz susamdan üretilen) farklı sürelerde (1-30 dakika) 35 kHz ultrasona tabi tutulmuştur. Bu çalışmanın sonuçları, ultrason uygulamasının tahinin stabilitesini artırma ve kalitesini koruma potansiyeline sahip olduğunu göstermektedir.

Anahtar kelimeler: *tahin, tahinultrason, ultrason teknolojisi, faz ayrıştırma*

Effects of Different Drying Methods and Temperatures on the Bioactive Compounds in Purple Carrot Extracts

Muhammed Zahid Kasapoglu

Department of Nanotechnology, Institute of Nanotechnology and Biotechnology, Istanbul University-Cerrahpaşa, Avcılar, Istanbul 34320, Turkey

Abstract

This study investigated the effects of different drying methods (vacuum, ultrasound-assisted vacuum, and hot air) and temperatures (50, 60, and 70 °C) on the changes in bioactive compounds of purple carrot extracts. The amounts of gallic acid, caffeic acid, hyperoside, quercetin, myricetin, and rutin were evaluated using HPLC analysis. Drying methods, including vacuum (V50, V60, V70), ultrasound-assisted vacuum (USV50, USV60, USV70), and hot air (E50, E60, E70), significantly influenced the phenolic compound content. The results showed that caffeic acid and rutin levels were particularly higher in vacuum and ultrasound-assisted drying methods. The lowest rutin content was observed in fresh carrots (3.76 µg/mL), whereas significant increases were found in USV70 (20.54 µg/mL) and V70 (16.80 µg/mL) samples. Caffeic acid content reached the highest levels in V50 (9.62 µg/mL) and USV50 (10.42 µg/mL) methods. Although compounds like hyperoside and quercetin were present in lower amounts, their levels varied depending on the drying temperatures. These findings highlight the significant impact of drying methods and temperatures on preserving and enhancing bioactive compound levels. This provides an opportunity to develop targeted production strategies for functional food applications using processed products such as purple carrots.

Garlic and Ginger Pastes as natural Antioxidant in Spent Hen Meat Nugget

Olayemi R. Awodoyin and Oluwatobiloba D. Oyekunle

Department of Animal Science, University of Ibadan, Ibadan, Oyo State, Nigeria
Corresponding author. Telephone: +234(0) 8164193904; Email: olayemiawodoyin@gmail.com

Abstract

Economic value of spent hen can be improved through value addition. However, spent hen contain high fat and coupled with the fact that processed chicken meat is more susceptible to oxidative deterioration make spent hen meat products prone to oxidative degradation. Five spent hen chicken nugget emulsions were formulated (T1 ascorbic); T2 0.5% Garlic, T3 1.0% Ginger, T4 0.5% Ginger, T5 1.0%Ginger. The mixtures from each formulation were filled into boxes (20×10 cm) (approximately 40±1 g each), deep fried in Grand Soya oil® for 10 minutes at 190±2oC (frying temperature). The fried nuggets were allowed to cooled down to room temperature and a portion from each nugget was packaged in air tight zip loc bags and stored in a refrigerator (4oC). Frying yield (%), phenol content (GAEmg/g, flavonoid ((mg QE/g), cholesterol (%) and Thiobarbituric reactive substances (TBARS) mg MDA/kg). (Data generated were analysed using ANOVA@Pα0.05. Frying yield 92.29 (0.5% ginger) is similar to 88.62 (0.5% garlic) and significantly higher than 82.29 (ascorbic) and 85.72 (1.5% garlic) but significantly lower than 97.87 (1.5% ginger). Nugget with 1.5% ginger had 24.92 phenol content which is significantly lower (P<0.05) than 20.47 (0.5% ginger), 18.37 (1.5% garlic), 17.63 (0.5% garlic) and 16.06 (ascorbic). Flavonoid (9.34) and cholesterol (72.82) contained in ascorbic nugget is significantly higher than 8.20; 61.84 (0.5 ginger), 8.69; 57.09 (1.5% ginger), 4.71; 68.49 (0.5% garlic) and 6.32; 59.05 (1.5% garlic) for flavonoid and cholesterol respectively. Irrespective of the storage days, ascorbic nuggets had higher TBARS levels than nuggets with ginger and garlic pastes. The reduced cholesterol contents and low levels of TBARS in the spent hen chicken nuggets with ginger and garlic pastes elucidated that both spices can be part of spent hen chicken nuggets formulation.

Key Words: *Nuggets, Oxidative deterioration, Spent hen, Value addition, Scavenging radicals.*

Introduction

The egg industry, at the end of laying cycles produces a significant amount of spent hens as by product (Mahapatra, 1992; Chuaynukool et al., 2007). Spent hen meat is an excellent and cheaper source of animal protein, rich in fat, cholesterol (Sarkar et al., 2020) and similar to broiler meat in term of nutritional quality (Chueachuaychoo et al., 2011). However, despite of these beneficial qualities, spent hens have low economic value (Sarkar et al., 2020). They are most times underutilized and usually used in very low priced minced products (Chuaynukool et al. 2007). This is due to their poor functional characteristics and some sensory properties such as juiciness and tenderness all of which is attributed to the high collagen content they possess (Abe et al., 1996). For instance, spent hen meat still remains tough and fibrous even after cooking with high pressure for a long time (Mendiratta et al. 2012). However, their economic value can be improved through value addition by processing into convenient and shelf stable meat products (Sarkar et al., 2020).

The changing raw meat into to a high quality meat product through processing is usually referred to as value addition of meat. Chicken nugget is an example of food usually preferred by consumers because of its convenience (Sharima-Abdullah et al., 2018) and has been identified as one of the value added meat product that can be used to increase the consumption of poultry meat (Yogesh et al., 2013).

Nugget is a ready to cook and ready-to -eat deep fried meat product usually prepared with chicken meat (Hwuang et al., 2011). Its simple preparation makes it a generally acceptable fried meat products and a popular choice for a quick meal among consumers (Lukman et al., 2009).

Broiler chicken meat is usually used in the production of chicken nuggets because of its high quality characteristics such as high carcasses and better tenderness when compared to spent hen meat (Bhosale et al. 2011). However, throughout the world, broiler chicken meat is of economic importance and also have a good demand for direct meat consumption (Sabikun et al. 2019). It is therefore of utmost importance to find a way of converting the less palatable and tough meat of spent hen into attractive, convenient and more acceptable meat product using appropriate technology. The high fat content of spent hen together with the susceptibility of processed chicken meat to oxidative degradation (Xiao et al., 2011) make spent hen meat products prone to oxidative deterioration. Lipid oxidation in deep fried food has been reported as one of the important criteria that determine the quality and safety of the final product (Izaki et al., 1984). However, this can be reduced or inhibit with the inclusion of

antioxidants in the product during preparation. Antioxidant is one of the strategies and also an effective means used in controlling and reducing the oxidation in meat and meat products (Penchalaraju et al., 2017) as they are the first line of defence against free radicals (Ayoade et al., 2022). This implies that using spent hen meat in the formulation of nuggets will require the incorporation of antioxidant. Natural antioxidants are usually in the form of phenolic compounds such as flavonoids, phenolic acids, tocopherols commonly found in plants (Ali et al., 2008).

Phenolic compounds are group of plant secondary metabolites extensively found across diverse plant, including vegetables, fruits, cereals, legumes, spices and herbs (Balasundram et al., 2006; Zhang et al., 2022). Apart from their use as aroma additives in food many herbs and spices, are excellent sources of phenolic compounds with good antioxidant potentials. Examples of common and readily available spices with good antioxidant properties include garlic and ginger. They are common food spices that are used either singly or in combined form in the diet (Otunola and Afolayan, 2013).

Garlic (*Allium sativum* L.) is culinary spice rich in polyphenolic compounds (Awan et al., 2017; dos Santos et al., 2022) and other bioactive compounds such as flavonoids and organosulfur. These compounds are responsible for its biological activities (Shang et al., 2019; Tavares et al., 2021) such as antioxidant, anti-inflammatory, antimicrobial and immunomodulatory properties (Melguizo-Rodríguez et al., 2022). Fresh garlic bulb contains 65% water, 28% carbohydrates, 2.3% organosulfur compounds, 2% protein, 1.2% free amino acids and 1.5% fiber (Lidiková et al., 2022; Melguizo-Rodríguez et al., 2022).

Ginger (*Zingiber officinale* Roscoe) is usually use in food as a spice (Ali et al., 2008) or seasoning (An et al., 2016). It is composed of phenolic (gingerols, shogaols, and paradols), terpene, polysaccharides, lipids, organic acids and raw fibers (Mao et al., 2019). Fresh ginger contains 85% - 95% water (Prisacaru et al., 2023), 11.97 mg GAE/g total phenolic dry weight (An et al., 2016). This study therefore aimed at investigating the antioxidant potential of garlic and ginger pastes at different inclusion levels in the formulation of spent hen chicken nuggets

Material and methods

Food grade ascorbic acid was purchased from a standard and reputable food stall market. Fresh garlic bulbs were purchased from Bodija a local market within University of Ibadan environment. The garlic (*Allium cepa*) bulb dry skin was removed and the cloves peeled and finely crushed using a kitchen grater. For ginger (*Zingiber officinale* Roscoe), the peels were removed and the fingers cut into slices for easy grinding in the kitchen blender. After grinding, each paste was packed separately in different container until further use.

Sample preparation (raw and cooked nuggets)

Spent hen was obtained from a reputable farm in Ibadan. This was slaughtered, defeathered and cut into primal cuts. Meat was excised from all part of the chicken. All dirts and subcutaneous fat were manually trimmed off and the chicken meat cut into smaller chunks and minced (5mm plate) using a commercial meat grinder. The grounded meat was refrigerated at -4°C until further use. Five spent hen chicken nugget emulsions were formulated (Table 1), each emulsion was thoroughly mixed in an electric mixer for 5minutes to obtain a homogenous mix. The batter from each formulation was filled into boxes (20×20 cm) (raw nuggets) (individual nugget piece weighed 50±1 g/ piece). These were deep fried in Grand Soya oil® at 190±2ºC for 10 minutes with intermittent turning to an inner temperature of 75 °C (using a probe thermometer). The deep fried nuggets were arranged in a tray and placed on a rack and allowed (30 minutes) to cool down to room temperature. The fried nuggets were packaged and stored under refrigeration (4ºC) temperature for further study. The experiment was replicated three times.

Table 1. Ingredient formulation composition of nugget

Ingredients (%)	Ginger			Garlic	
	Ascorbic	0.5%	1.5%	0.5%	1.5%
Chicken meat	70.0	70.0	70.0	70.0	70.0
Ginger paste	0	0.5	1.5	0	0
Garlic paste	0	0	0	0.5	1.5
Ascorbic acid	1.5	0	0	0	0
Refined salt	1.5	1.5	1.5	1.5	1.5
Ice water	5.0	5.0	5.0	5.0	5.0
Pepper	2.0	2.0	2.0	2.0	2.0
0nion paste	2.0	2.0	2.0	2.0	2.0
Skim milk	9.0	10.0	9.0	10.0	9.0
Flour	9.0	9.0	9.0	9.0	9.0
Total	100.0	100.0	100.0	100.0	100.0

Design of the experimental

The study was a completely randomized design. Five different batches nugget were produced: ascorbic, 0.5% garlic, 1.5% garlic, 0.5% ginger and 1.5% and each batch was replicated three times

Parameters measured

pH

Samples (approximately 10g) of each nugget were weighed into a flask followed by addition of 50 mL of distilled water (Nopianti et al., 2012). The samples were then homogenised using an homogeniser (Model Stomacher® 400 Circulator). The pH of homogenized nuggets were measured using pH meter (Model Aqua Lab).

Frying Yield Percentage

Frying yield (%) was calculated, as follows (Naveena et al., 2006):

$$Frying\ yield\ (\%) = \frac{weight\ of\ freshly\ cooked\ spent\ hen\ chicken\ nugget}{weight\ of\ raw\ spent\ hen\ chicken\ nugget} X\ 100$$

Determination of cholesterol content of deep fried nugget

The spectrophotometric procedure was used in determining the cholesterol content of the nuggets as described by Egbert et al. (1991) with slight modifications. Five grams of each of the nugget sample was homogenized and lipid was extracted using the petroleum. The lipid residue was saponified by heating with 8ml of 15% potassium hydroxide in 90% ethanol and 2ml of 3% propyl gallate in water bath at 88°C for 10 minutes and the solvent is later evaporated in a water bath at 50°C. The solution was cool down, and 10ml of petroleum ether added and vortexed for 30 second. After separation, 2mls of the ether layer was pipetted into a clean test tube and evaporated in a water bath in a water bath at 50°C. After evaporation, 3ml of acetic acid saturated with ferrous sulfate and 1ml of concentrated sulphuric acid were added to develop the chromophore for colorimetric analysis of cholesterol. The absorbence was measured with a UV-VIS spectrophotometer at 490mm against a t blank and calculated as;

$$cholesterol\ (mg/g) = \frac{absorbance\ of\ sample\ x\ gradient\ factor\ x\ dilution\ factor}{weight\ of\ the\ sample\ taken}$$

Determination of total phenol and flavonoid contents

These were carried out on the raw garlic and ginger pastes and on the five different cooked Spent Hen Chicken Nuggets (SHCN). The phenol contents were determined using the procedure of Singleton *et al* (1999) through Follin-Ciocalteu reagent and expressed as Garlic Acid Equivalents (GAE). Each sample (200mg) was mixed with 10 ml acetone and extraction with ultrasonic extraction for 20 min (2×10 min, 5 min rest in between) carried out at room temperature. The extract was centrifuged for 10 min at 3000 rpm. One milliliter (1ml) of supernatant was mixed with 0.5 ml Folin-Ciocalteu 1 N and 2.5 ml sodium carbonate, vortexed, and then held for 40 min at room temperature. The absorbance was measured at 725 nm. A standard curve was plotted using different gallic acid concentrations, and the amount of total phenol was calculated as Gallic Acid Equivalents (GAE) in mg/g. The absorbance of both the samples and the standard concentrations were read on a Digital Spectrophotometer at a wavelength of 510 nm. The percentage of phenol is calculated using the formula:

$$phenol\ GAE(mg/g) = \frac{absorvence\ of\ sample\ x\ gradient\ factor\ x\ dilution\ factor}{weight\ of\ sample\ x\ 10{,}000}$$

The total flavonoids were determined spectrophotometrically following the procedure of Zhishen et al. (1999). Total flavonoids of each samples were determined by weighing 5g each of grounded samples into a 100ml beaker and 80ml of 95% ethanol was added and stirred with a glass rod to prevent lumping. The mixture was filtered into a 100ml volumetric flask (through a Whatman No.1. filter paper) and made up to mark with ethanol. One (1) ml of the extract was pipetted into 50ml volumetric flask and four drops of concentrated hydrochloric acid was added after which 0.5g of magnesium turnings was added to develop a magenta red coloration. Standard flavonoid solution of range 0-5ppm were prepared from 100ppm stock solution and treated in a similar way with the hydrochloric and magnesium turnings like sample. The absorbance of magenta red coloration of sample and standard solutions were read on a digital Jenway V6300 Spectrophotometer at a wavelength of 520nm. The percentage flavonoid was calculated using the formula;

$$flavonoids(QE) = \frac{Absorvence\ of\ sample\ x\ gradient\ factor\ x\ dilution\ factor}{weight\ of\ sample}\ x\ 10000$$

Determination of DPPH Radical scavenging activity of ginger, garlic and chicken nugget

Free radical scavenging activities of the garlic, ginger and nuggets were determined using a stable 2, 2-diphenyl-1-picrylhydrazyl radical (DPPH) procedure described by Brand-William *et al*. (1995) and Puntel *et al*. (2005).

Assessment of Lipid oxidation in spent hen meat nugget

The extent of lipid oxidation was assessed using the level of thiobarbituric acid reactive substances in the nuggets at 0, 7 and 14 days. The procedure adopted was described by Radha Krishnan *et al*. (2014) with slight modification and each assessment was carried out in triplicates for each sample The amount of TBARS in the nuggets were expressed as milligrams of malonaldehyde per kilogram of chicken nugget (mg MDA/kg sample).

Statistical analysis

An analysis of variance (ANOVA) was performed on all the data generated and Duncan's multiple range tests at Pα 0.05 was used to determine differences between the treatment means.

Results

Ginger phenol (72.71) and flavonoid (21.06) contents (Table 2) were significantly higher (P<0.05) than 54.91 (phenol) and 18.65 (flavonoid) of garlic.

The DPPH percentage inhibition (Table 3) of ginger 93.68, 88.95, 84.92, 77.67, 71.42 at 5000, 2500, 1250, 625 and 312.5 µg/L were higher (P<0.05) than 90.46, 77.61, 70.39, 63.98 and 49.40 recorded for garlic.

The frying yield (92.20%) of nugget (Table 4) with 0.5% ginger is similar (P>0.05) with 88.62 (0.5% garlic) but significantly higher (P<0.05) than 82.29 (ascorbic) and 85.72 (1.5% garlic) and significantly lower (P<0.05) than 97.87 (1.5% ginger). pH 5.87(0.5% ginger) is similar with 5.43 (1.5% ginger) and 5.63 (0.5% garlic) but significantly higher than 5.33 (1.5% garlic) and lower than6.57 (ascorbic). Phenol (24.92) contained in 1.5% nugget is significantly higher P<0.05) than 16.06 (ascorbic), 20.47 (0.5%ginger), 17.63 (0.5% garlic) and 18.37 (1.5% garlic). Flavonoids (9.34) and cholesterol (72.82) of ascorbic nugget were higher (P<0.05) than 8.20; 61.84 (0.5% ginger), 8.69;57.09 (1.5% ginger), 4.71; 68.49 (0.5% garlic), 6.32; 59.05 (1.5% garlic) recorded for flavonoids and cholesterol contents respectively.

Displayed on (Table 5) is the radical scavenging potential 88.71, 88.51 and 71.86 of nugget with ascorbic at 5000, 2500 and 1250 µg/L were higher P<0.05) than 77.74; 68.71; 65.18 (0.5% ginger), 81.93;72.55; 68.24 (1.5% ginger), 76.00;66.50;53.31 (0.5% garlic), 79.18;71.81;63.20 (1.5% garlic) at concentration 5000, 2500 and 1250 µg/L respectively. At DPPH concentration of 625 µg/L, the inhibition % of nugget with 0.5% (60.88) and 1.5% (61.11) ginger paste were significantly higher (P<0.05) than 56.84 (ascorbic), 45.56 (0.5% garlic) and 54.17 (1.5% garlic). The inhibition % 47.50 of nugget with 1.5% ginger was significantly higher (P<0.05) than 40.90 (ascorbic), 44.32 (0.5% ginger), 36.60 (0.5% garlic) and 38.27 (1.5% garlic).

Table 2. Phenol and flavonoid contents of garlic and ginger used in this study

Parameters (%)	Ginger	Garlic	SEM	P-Value
Phenol GAE mg/g)	72.71^{a}	54.91^{b}	0.091	<.0001

14	0.64[a]	0.45[b]	0.25[d]	0.40[b]	0.37[c]	0.012	<.0001

[a,b,c,d,e:] Means of different superscripts on the same row are significantly different (P < 0.05)

The TBARS (Table 6) at days 0 (0.53), 7 (0.55) and 14 (0.64) were significantly higher (P<0.05) than 0.20;0.24;0.45 (0.5% ginger), 0.18; 0.18;0.25 (1.5% ginger), 0.28; 0.39;0.40 (0.5% garlic) and 0.22;0.32;0.37 (1.5% garlic) recorded at 0, 7 and 14days respectively.

Discussion

The phenols and flavonoids results showed that ginger and garlic possess high amount of phenols and flavonoids with ginger containing higher amounts of both compounds. This result further confirm that ginger is one of the plants that is rich in phenolic compounds (Mahmudati et al., 2019).

Di-phenyl picry hydrazil (DPPH) is widely used as a free radical scavenging assay to evaluate the antioxidant activity of compounds (Ayoade et al., 2022). The DPPH assay is an easy, rapid and convenient method of evaluating antioxidants and radical scavengers (Bao et al., 2005). The percentage Hydroxyl (OH) radicals of ginger and garlic in this study although dose dependent were high indicating a high scavenging ability of hydroxyl radicals in both spices. This trend was also reported by Ayoade et al. (2022) who reported a DPPH of 85.358 and 87.694 for ginger and 83.956 and 79.751 for garlic from aqueous and ethanol extracts respectively.

The pH of the spent hen chicken nuggets with garlic and ginger in this study were lower than what was obtained in nugget with ascorbic acid. This low pH might be attributed to the rich bioactive compounds (Khatun et al., 2022) of both garlic and ginger. The pH of nuggets here was lower than 6.01 to 6.11 recorded by Khatun et al. (2022) in chicken nugget formulated with carrot and ginger.

The frying yield showed that as the inclusion of ginger paste increased the nugget yield increased while the reverse is observed in the nugget with garlic paste inclusion. This could be as a result of the higher water percentage (85-95%) contained in ginger (Prisacaru et al., 2023) when compared to 65% (Melguizo-Rodríguez et al., 2022) in garlic. The yield from garlic and ginger pastes nugget of this study was higher than 88.0-89.3% obtained in nugget with added fat and variable salt contents (Yogesh et al., 2013) and 76.5 - 85.6 g obtained in spent hen nuggets with milk fat and potato mash.

Normally, raw poultry meat usually has a cholesterol content of approximately 27- 90 mg/100 g while that of cooked poultry meat falls within the range of 59 to 154 mg/100g (Bragagnolo, 2009). Nugget samples formulated with various levels of ginger or garlic pastes significantly had lower levels of cholesterol than nuggets with food grade ascorbic acid. The cholesterol content of the spent hen nugget tends more to the lower limit of the required/permissible amount of cholesterol in meat products. This implied a healthier meat products as high cholesterol in food has been reported to have a negative effect on human health.

The higher level of phenol content recorded in the spent hen chicken nugget with ginger paste might be due to the ginger having a high phenolic content (Table 2). This same trend was also reported by Zhang et al. (2016) who opined that the high phenolic content in duck nugget with black garlic powder was due to the high phenolic content of the black garlic powder.

The DPPH scavenging activities of both ginger and garlic used in this study depict that they are dose responsive as scavenging activities increased with higher concentration of either compound. This same trend was also noticed with the spent hen nuggets as scavenging activity respond positively to increase concentration of the pastes in the spent hen nugget.

This further elucidated that scavenging radicals can be inhibited in meat and meat product by adding antioxidant compounds (Lishianawati et al., 2021). The result of the DPPH also revealed that ginger had a higher scavenging potential than garlic thus confirming that ginger had a high antioxidant capacity (Widayat et al., 2017). This also agreed with Ahmed et al. (2019) who reported that ginger exhibited higher scavenging activity than garlic and Nuutila et al. (2003) and Capasso (2013) who both reported lower antioxidant activity in garlic.

The high scavenging potential of the ginger was attributed to the high phenolic contents of ginger (Table 2). This is because phenolic compounds are phytochemicals found in plants and spices which account for most of their antioxidant activities (Ayoade et al., 2022). They are also the major primary antioxidant group of compounds or free radical terminators (Lishianawati et al., 2021) thus the high scavenging potential observed in ginger.

The lipid inhibition by ascorbic, garlic and ginger (Table 6) was obvious throughout the storage period (14 days) as all products did not exceed the permissible limits of TBARS value of 0.90 mg MDA/kg for meat and poultry products (Egyptian Organization for Standardization and Quality Control, 2005; El-Sohaimy et al., 2022). However, at the beginning (zero day) of the experimental storage, there was remarkable significant differences in TBARS levels among the different nugget's samples. The pre-treatment of the chicken nugget ingredients with garlic and ginger pastes reduced lipid oxidation drastically when compared with nugget with food grade ascorbic acid. The potency of ginger and garlic in retarding lipid oxidation in SHCN in the present study implied that there is low aldehyde compounds accumulation which further emphasizes the usefulness and importnace of utilizing ginger and garlic paste in processed meat products such as chicken nuggets.

Furthermore, the antioxidant effect of garlic and ginger paste on spent hen nugget at refrigerated storage was more pronounced with nugget with ginger paste having a lower TBARS value. This effect might be probably due to the fact the ginger contains higher content of phenol and flavonoid (Table 2). This is because linear correlation exists between phenolic content and antioxidant activity (Gheldof and Engeseth, 2002) thus high phenol content increases antioxidant activity (Velioglu et al., 1998; Holasova et al. 2002). Furthermore, higher flavonoids also indicate higher scavenging activity because flavonoids also function in scavenging free radicals, inhibition of peroxidants and chelating transition metals (Nickavar et al., 2007). The antioxidative effectiveness of ginger in reducing lipid oxidation was also reported by Baker and Alkas (2020) when ginger and rosemary extracts were compared on their potency in increasing meat quality. However, the TBARS of nugget with ginger and garlic paste inclusion at end of the storage period did not exceed 0.5 mg/kg reported to be the threshold at which rancid flavour can be detected by consumer (Choi et al., 2010). The obtained TBARS in either of the two spices pastes was lower than 0.46 mg MDA/kg reported in nugget with quinoa flour after 18 days of cold storage (El-Sohaimy et al., 2022).

Conclusion

Quality characteristics of fresh and stored spent hen chicken nuggets with ginger and garlic pastes were highly remarkable implying that both spices can be part of spent hen chicken nuggets formulation. This is evident in the reduced cholesterol contents of the freshly prepared deep fried spent hen chicken nuggets. Furthermore, ginger and garlic pastes were highly effective in reducing the rate oxidative deterioration of the nuggets which is exhibited in the low TBARS when compared with ascorbic acid marinated nuggets. This implied that addition of bioactive compounds such as ginger and garlic pastes up to 1.5% inclusion will be an effective functional ingredient for maintaining the quality attributes especially deterioration of lipid during storage of spent hen chicken nugget. The findings of this study elucidated that spent hen can be effectively utilized by processing into better-accepted, convenience ready-to-eat and shelf stable meat products such as chicken nugget.

Investigation of in vitro Antibacterial Potential of Various Wood Vinegars Against Plant Bacterial Disease Agents

Merve Oğuz*, Soner Soylu, Yusuf Gümüş

Department of Plant Protection, Faculty of Agriculture, Hatay Mustafa Kemal University, 31034 Hatay, Türkiye
**Corresponding Author: mervekara@mku.edu.tr*

Abstract

Wood vinegar, also known as pyroligneous acid (PA), is a liquid mixture with organic properties obtained from the condensation of smoke produced by the charring or pyrolysis of wood. The aim of this study was to determine the *in vitro* antibacterial activity of three different PAs obtained from the pyrolysis of apricot kernels (AKPA), hazelnut shells (HSPA), and kermes oak (OPA) against plant pathogenic bacterial species such as *Curtobacterium flaccumfacies* pv. *flaccumfaciens*, *Pectobacterium carotovorum* subsp. *carotovorum*, *Pseudomonas syringae* pv. *phaseolicola* and *Bacillus pumilus*. The antibacterial activity of wood vinegar on the development of disease agents was evaluated by measuring the inhibition zone diameters under in vitro conditions using the disk diffusion technique. According to the mean inhibition zone diameters, the most effective PA was HSPA with a zone diameter of 20.33, followed by AKPA and OPA with zone diameters of 20.13 and 19.33, respectively. The highest antibacterial activity was shown by HSPA against *C. flaccumfacies* pv. *flaccumfaciens* (24.17 mm inhibition zone diameter), followed by AKPA and OPA treatments with 23.33 and 21.17 mm inhibition zone diameters, respectively. According to the mean inhibition zone diameters, the most susceptible bacterial species was shown against *C. flaccumfacies* pv. *flaccumfaciens* with a zone diameter of 22.89, followed by *Pectobacterium carotovorum* subsp. *carotovorum*, *Pseudomonas syringae* pv. *phaseolicola* and *B. pumilus* with zone diameters of 19.89, 18.50 and 18.44, respectively. Among the bacterial disease agents, *C. flaccumfacies* pv. *flaccumfaciens* was found to be the most sensitive to the three PAs used in the study. AKPA and HSPA were the most effective treatments against *C. flaccumfacies* pv. *flaccumfaciens*, while OPA was the most effective against *C. flaccumfacies* pv. *flaccumfaciens* and *P. carotovorum* subsp. *carotovorum*. The results obtained showed that wood vinegar has the potential to be used as a bio-bactericide against important plant bacterial disease agents.

Abstract

The freshwater fishes (*Schilbe mystus, Sarotherodon galileus, Mormyrus rume and Clarias anguillaris*) are the most commercially important finfishes in Nigeria. Investigations were made on the accumulation of five (5) heavy metals: Lead (Pb), Chromium (Cr), Iron (Fe), Cadmium (Cd), and Zinc (Zn) collected from water, sediment and *fish organs* (gills, intestines and flesh) inhabiting the Ajiwa dam. Standard methods analyses revealed low accumulation of metals in the water and flesh of the finfishes for both seasons compared to the sediment. The mean concentration of heavy metals decreased in this sequence: Fe>Zn>Pb>Cr>Cd (wet season) and Fe>Zn>Cr>Cd>Pb (dry season) for all sampled fish organs. Fe had the highest mean concentration (106±2.30mg/l) in all the samples while Cd (0.43±0.02mg/l) and Pb (0.22±0.01) had the least mean concentration for the wet and dry seasons respectively. The bio-water accumulation factors showed that the flesh accumulated all the five metals with Fe (>0.5mg/l) as the highest and Zn (≤0.221mg/l) as the least. The bio-sediment accumulation factors in the flesh were ≤2 mg/kg. The results of heavy metals concentrations obtained from the sampled fish organs and water from the dam were within the limit of FAO/WHO recommendation for human consumption and striving of the finfishes.

Key Words: *Ajiwa dam, bioaccumulation, finfish, Mormyrus rume, seasonal*

Introduction

Decades ago, the ability of the aquatic ecosystem to sustain this important aquatic resource (fishes) has come under threat, as a result of increasing contamination of surface water and sediments in the aquatic medium as it accumulates in aquatic organisms (planktons and invertebrates) and invariably, bioaccumulates in humans, the final consumer of the aquatic resources, which now pose a great concern globally (Malik et al., 2010; Aghoghovwia *et al*., 2016; Hossain *et al*., 2016; Akinjogunla and Lawal-Are, 2020; Akinjogunla *et al*., 2023). Water plays a very significant role in the life of human and aquatic organisms. Water with zero content of toxicant is essential for living a healthy life since polluted water can pose humans health at risk through direct or indirect contact with dangerous chemicals (Akinjogunla *et al*., 2023).

In the recent times, Ajiwa irrigation Dam, Katsina has been subjected to a lot of anthropogenic pollutants capable of impairing the healthy status of the river with the influence of inhabitants and fisherfolks on the dam (Akinjogunla and Shuai'bu, 2022). Aquatic contamination has been increased by industrial revolution, mechanical waste and anthropogenic activities. Significant pollutant discharge into water have resulted to magnanimous hazards to the fresh water ecosystem. Contaminants of aquatic systems with heavy metals is one of the most challenging problems globally now, because of their toxicity, persistency and ability of bioaccumulation (Zeitoun and Mehana, 2014). Metals accumulate in sediment at a considerable amount and finally enters into the food chain through water and plants (Bhuyan and Islam 2017).

Finfishes constitute major sources of animal protein intake of human, (Akinjogunla *et al*., 2021; Akinjogunla and Usman, 2023; Akinjogunla and Shehu, 2024), particularly in developing countries and are consumed or presented in various palatable ways (fresh, cooked, grilled, dried, fried or smoked) depending on individual's taste, preference or socio-economic status (Akinjogunla *et al*., 2017). Fishes are the most important aquatic biota and are susceptible to heavy metals pollution (Akan *et al*. 2012).

Heavy metal toxic waste is considered as a major ecological disaster because of its inability to breakdown to smaller harmless pieces and so, they regenerate to survive in the environment and also in the aquatic organisms (Ayangbenro and Babalola 2017). In aquatic system, the ambient environment (water and sediment) is usually the medium and receiving point of these metal pollutants (Gilbert &Avenant-Oldewage 2014). Pollution appraisal in an environment based on water analyses only is not a comprehensive and precise method of identifying contaminants in aquatic systems (Ismail *et al*. 2016) while metal concentration in sediment is also an indispensable tool in water quality evaluation (Abdel-Khalek *et al.* 2016). The biotic and abiotic properties of the aquatic

environment differ from one habitat or ecosystem (marine, estuarine or freshwater) to another. Human activities (domestic or industrial) that can result in the alteration of the waterbeds, presence or absence of fauna (preys or predators), support or impeding of aquatic growths etc. can lead to degradation of water quality (Verma *et al.*, 2012).

The concentration of metals becomes toxic to both the fish and the final consumer (human and animals) when it exceeds the permissible level (Abdallah et al., 2012; Adaka *et al.*, 2017; Akinjogunla and Lawal-Are, 2020; Okunade *et al*., 2021; Akinjogunla *et al*., 2023). This threshold limit varies not only between different metals but also among different species. Metals become toxic when the metabolic activities of the organism fail to detoxify them (Mansour and Sidky, 2002). Exposure to heavy metals could eventually lead to health hazards or threats connected with the ingestion of contaminated / polluted fish by man. All these sources of pollution affect the physiochemical characteristics of the water, sediment and biological components (Akinjogunla et al., 2023), and thus the quality and quantity of fish stocks (Mantovani, *et al.*, 2005; Singh, *et al*., 2006).

Schilbe mystus, Sarotherodon galileus, Mormyrus rume and Clarias anguillaris are freshwater fishes that are of great commercial importance and in abundance in the study area (Akinjogunla and Shuaibu, 2022). Fish and other aquatic food are capable of concentrating heavy metals in their tissues (Akinjogunla and Lawal-are, 2020; Akinjogunla et al., 2023) and for the fact that they play a vital role in human nutrition, they need to be checked properly to ensure that unnecessary high level of some organic and inorganic pollutant is not being transferred to human through consumption.

To the best of our knowledge, from literature survey, no work has been reported on the assessment of heavy metals in fishes, sediments and water of the Ajiwa Irrigation Dam. Therefore, in this study we accessed the concentration levels of selected heavy metals such as Cadmium (Cd), Lead (Pb), Chromium (Cr), Zinc (Zn) and Iron (Fe) in the four commonly consumed finfishes (*Schilbe mystus, Sarotherodon galileus, Mormyrus rume and Clarias anguillaris)* tissues (gills, intestine, flesh) of the Ajiwa irrigation Dam.

Materials and Method

Sampling Area

Ajiwa Irrigation dam / reservoir (Figure1) is located at Batagarawa Local Government Area of Katsina State (Akinjogunla and Shuai'bu, 2022) with its primary purpose of suppling water but as time goes on, fishing activities was added (Akinjogunla and Usman, 2023).

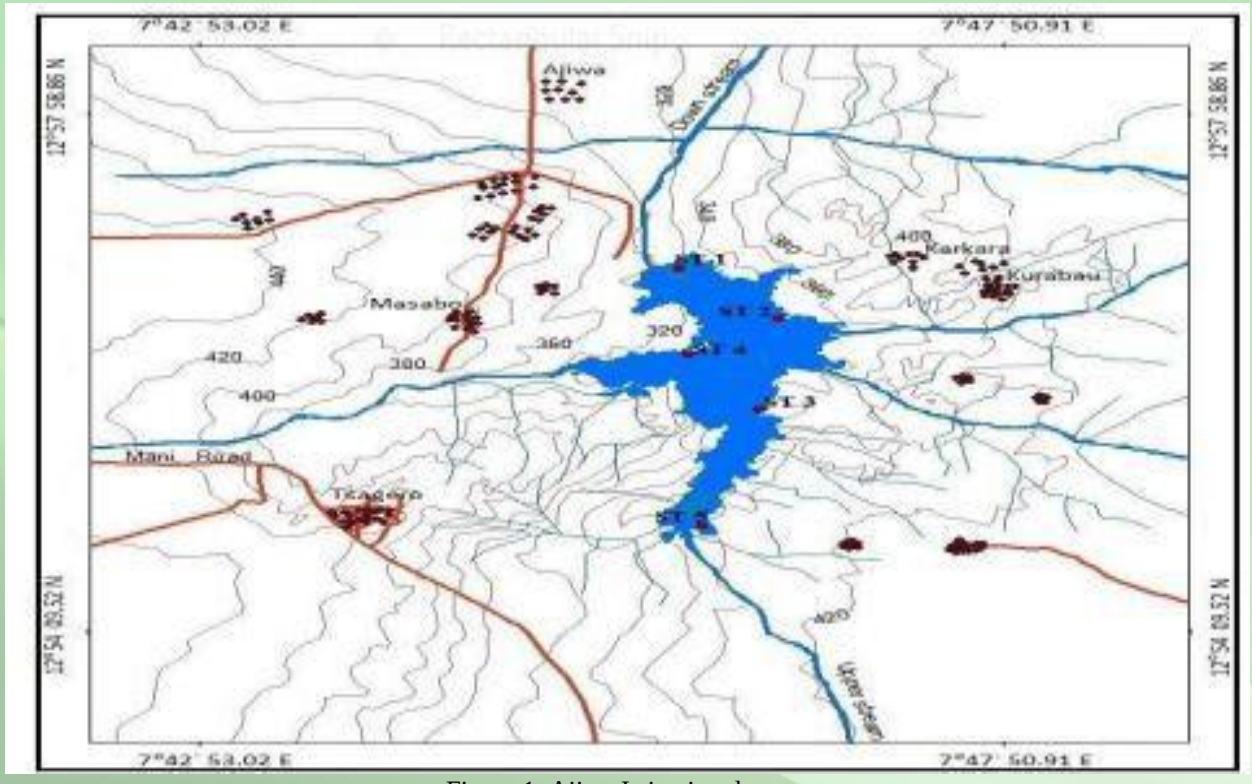

Figure 1. Ajiwa Irrigation dam
Source: Akinjogunla and Shuai'bu, 2022

Sampling stations
Along the river, three (3) sampling stations were selected and named as sampling station A, B, C across the Dam area, with particular reference to areas where there are continuous human interactions and discharge of wastewater.

Water sample collection
Water samples were collected at each sampling station (Station A, B, C) for a period of six (6) months. Water sampling was done by immersing sampling bottles at about 10cm below the water surface. A volume of 500 ml of water sample was collected from each sampling station.

Sediment Sample Collection
Sediment from each study station was collected using hand trowel into pre-cleaned polythene bag for the period of six (6) months between July (which marked the peak of rainy season) to December, 2023 which marked the peak of dry season. All the samples were collected under the same condition. The sediment samples collected were kept in polyethylene bags and preserved under a freezing condition (< -20 °C) before laboratory analysis.

Fish Samples Collection and Identification
Four (4) fish species (*Schilbe mystus, Sarotherodon galileus, Mormyrus rume and Clarias anguillaris*) were collected monthly for a period of six months at the fish landing site of the dam. The fishes were washed using the dam water and preserved in an ice cooler and transported to the Department of Biochemistry laboratory, Gombe State University, Gombe State.

Samples Preparation and Analysis
Water sample
Raw water was subjected to wet digestion. 100ml unfiltered water was measured into a 250ml beaker and 20ml "Analar" nitric acid solution plus 10ml of 50% hydrochloric acid solution was added. The acidified water was evaporated to almost dryness on a hot plate and 5ml of 50% hydrochloric acid was again added and heated for 15 minutes. The beaker was removed and cooled to room temperature before transferring the contents into a 100ml volumetric flask and made up to the mark with distilled water (Wufem *et al*., 2009). The digested water was filtered and analyzed for the levels of heavy metals using AA6800 (Shimadzu Japan). Atomic Absorption Spectrophotometer (AAS).

Fish samples
The fish organs (gills, intestines and flesh) were eviscerated and then transferred into electric oven at 40^0C. They were dried in the oven at this temperature for 24 hours and then pulverized in a clean dry porcelain mortar (Ahmed *et al*., 2010). The pulverized samples were dried further for 1hour at a reduced temperature of 20^0C and put into clean dried bottles. 3.0g of the dried fish samples was weighed into a silica crucible and ashed in a muffle furnace at a temperature of 600^0C for 5 hours (Adeniyi *et al*., 2005). The ashes were cooled to room temperature and sieved to remove particles and then transferred into a 250ml conical flask. Thereafter, 20ml of concentrated HNO_3 was added and diluted to 50ml with deionized water and swirled gently after which the volume was made up to 100ml with deionized water and analyzed for heavy metals as with the water.

Sediment
Sediment Samples were dried, ground and sieved with 200mm mesh screen. For each sample, 5.0g of sediment was measured into 150ml flasks. 50ml of 0.1M HCl was added and the flasks was agitated for 30 mins at 200 rev/min. The mixture was filtered into 50ml flask and made up to the mark with deionized water (Ahmed *et al*., 2010).

Chemical Analysis
Flame atomic absorption spectrophotometry (FAAS) AA6800 (Shimadzu Japan) supplied with ASC-6100 auto sampler and air acetylene atomization gas mixture with elements specific hollow cathode lamp was used for the determination of the targeted heavy metals at Department of Biochemistry laboratory Gombe State University, Gombe State. Analytical grade standards of each target heavy metals were used.

Determination of Bioaccumulation Factors
The bioaccumulation factors of the heavy metals in the organs, water and sediment were determined using the method adopted to gauge the bioaccumulation of trace metals as advocated by the FEPA (2003) in the tissues of commonly consumed fish.

$$BWAF = \frac{Heavy\ metal\ concentration\ in\ organs}{Heavy\ metal\ concentration\ in\ water}$$

$$BSAF = \frac{Heavy\ metal\ concentration\ in\ organs}{Heavy\ metal\ concentration\ in\ sediment}$$

Statistical Analysis

Data generated from this study were analyzed as mean ± standard error using Microsoft Excel 2010. All means recorded were determined considering a level of significance less than 5% ($p < 0.05$) at 95%. It was used to test for significant relationship among heavy metals levels in muscle, water and sediment of the sampling site.

Results

The mean concentration of Cadmium (Cd), Lead (Pb), Chromium (Cr), Zinc (Zn) and Iron (Fe) in the various tissues (gills, intestines and flesh) of common edible fishes (*Schilbe mystus – S. mystus, Sarotherodon galileus – S. galileus, Mormyrus rume – M. rume* and *Clarias anguillaris – C. anguillaris*), sediment and water from three (3) sampling points at the Ajiwa Irrigation Dam in Kastina State during the wet and dry seasons is reported in Table 1.

Table 1. The concentration (Mean ± SD, in mg/kg) of metals in tissues of fish samples obtained from Ajiwa irrigation Dam, Katsina during both wet and dry seasons.

Keys: M: Metals (Mg/kg); Cadmium (Cd); Lead (Pb); Chromium (Cr); Zinc (Zn); Iron (Fe); *Schilbe mystus – S. mystus; Sarotherodon galileus – S. galileus; Mormyrus rume – M. rume* and *Clarias anguillaris – C. anguillaris*

The mean concentration of heavy metals in the fish tissues decreased in the following sequence: Fe>Zn>Pb>Cr>Cd in wet season and Fe>Zn>Cr>Cd>Pb in dry season for all sampled fish organs. There were no significant differences ($p>0.05$) of these metals observed between the sampled fish tissues, water and sediment and seasons. Fe recorded the highest mean values in both seasons (106±2.30mg/kg for wet season and 63.6±0.21mg/kg for dry season). Cd concentration has the lowest value (0.43±0.02mg/kg) in the gills of *C. anguillaris* in wet season while Pb had the lowest value (0.22±0.01mg/kg) in the flesh of *S. mystus* and intestines of *C. anguillaris* in the dry season.

In this study, the gills and flesh of *S. mystus* were recorded to contain the highest levels of Fe for the wet and dry seasons respectively while its intestines were recorded to have the highest value of Cd during the wet season only. The flesh of C. *anguillaris* recorded the lowest value of Fe for both seasons while its gills were recorded to have the lowest value of Cd during the wet season. During the dry season, the intestines of *M. rume* had the highest value of Pb while the intestines of *S. galileus* and *S. mystus* had the lowest levels of Pb.

Table 2. The concentration (Mean ± SD, in mg/l metals in water samples for both Wet and dry seasons obtained from Ajiwa irrigation Dam, Katsina.

Keys: Cadmium (Cd); Lead (Pb); Chromium (Cr); Zinc (Zn); Iron (Fe)

Table 2 below shows the mean concentration of these heavy metals (Cd, Pb, Cr, Zn and Fe) in the sampled water and sediments from the Ajiwa Irrigation dam. The highest metal accumulated was Fe (90.66±0.03mg/l and 106.0±2.57mg/kg) for both water and sediment samples respectively during the dry season while the lowest metal accumulated was Cr (0.07 ± 0.03mg/l and 0.60 ± 0.05 mg/kg) for water and sediment samples respectively for the wet season

The values recorded for Cd exceeded the tolerance limits for both sediment and water samples for both wet and dry seasons while values of Pb obtained in this study were within range for the sediment samples for both seasons but the values obtained for the water samples exceeded the WHO limits.

The values recorded for Cr during this study exceeded the tolerance limits for sediment samples for both seasons and water samples for the dry season only. Zn values exceeded the tolerance limits for both water and sediment samples for both the wet and dry seasons while Fe values recorded during the wet seasons for both water and sediment samples were within the limits but values obtained for both water and sediment samples for the dry season exceeded the acceptable tolerance values.

In Table 3, the bioaccumulation factor of fish tissues to water (BWAF) is presented. Cd values ranged between 0.503 in the gills of *C. anguillaris* to 1.661 in the flesh of *S. mystus* while Pb values were between 0.731 in the gills and intestines of *C. anguillaris* to 1.348 in the gills of *S. galileus*. Cr values ranged between 0.552 (in the gills and intestines of *C. anguillaris*) and 1.932 (in the intestines of *S. mystus*). Lowest to the highest values for Zn ranged from 0.221 in the intestines of *S. mystus* to 0.310 in the gills of *C. anguillaris*. The highest and lowest values of Fe (0.775 and1.813) were recorded for intestines of *S. galileus* and the flesh of *S. mystus* respectively. The least recorded values of Fe, Cr and Cd were found in sampled organs of *C. anguillaris* while least values for Zn and Pb were alternated between sampled organs of *S. galileus* and *S. mystus* respectively.

Table 4 shows the bioaccumulation factor between the fish tissues and sediments (BSAF) collected from the Ajiwa Irrigation dam, Katsina. Cd values recorded ranged across the sampled fish organs (gills, intestines and flesh) of the four selected fish samples from 0.410 (in the gills of *C. anguillaris*) to 1.380 (in the flesh of *S. mystus*). Pb values ranged between 0.537 in the intestines of *S. mystus* to 1.800 in the gills of *M. rume*. The values of Cr recorded was between 0.593 (flesh of *C. anguillaris*) and 2.093 (intestines of *S. mystus*) while the values for Zn recorded ranged from 0.219 in the intestines of *S. mystus* to 0.494 in the intestines of *S. galileus*.

The recorded values for Fe were between 0.523 from the intestines of *C. anguillaris* to 1.537 from the gills of *S. mystus*. Sampled tissues of *C. anguillaris* accumulated the least values of all the heavy metals examined while the highest values accumulated rotates between *S. mystus*, *M. rume* and *S. galileus*.

Discussion

This study revealed that all the heavy metals analyzed were found in water, sediment and fish samples of Ajiwa irrigation Dam, Katsina. The results obtained showed that the water samples were lower in heavy metals concentration in line with reference values for USEPA, (2010). However, the sediments accumulated more heavy metal than the water and fish samples, these have also been observed by numerous researchers (Moruf and Akinjogunla, 2019; Akinjogunla and Lawal-Are, 2020; Akinjogunla et al, 2023) in some study areas. Sediment has been known to be the major depository of metals, holding more than 99% of total amount of a metal present in the aquatic system (Ozturk *et al*., 2009). According to Brady *et al*. (2015), these metal toxins act together with the sediment, to escalate to sequestration. Thus, excessive dilutions of these heavy metal contaminants are detected in sediment which now serves as a reservoir to these metallic ions (Brady *et al*. 2015; Bai *et al*. 2018).

The high levels of metals at surface water observed at wet season could be attributed to the combined effects of the effluents from the use of herbicides, and the mining products depots, which were discharged into the river close to that station; similar conclusion was drawn by Obasohan and Oronsaye (2000). Presence of zinc in water bodies such as Ajiwa dam could be associated with human activities such as the use of chemicals and zinc-based fertilizers by farmers (Egila and Nimyel, 2002). The levels of Zinc, Chromium and Cadmium recorded at all the stations during this investigation were lower than the maximum acceptable limits for aquatic life as recommended by WHO (2011). The presence of Lead may be due to surface runoffs and municipal waste discharges into the water bodies. The values obtained for Pb, Cr and Cd in the flesh, gills and intestine of the finfishes are in line with values reported by Wokoma (2011), where concentration of lead in tissue of *Psuedotolithus elongatus*, *Mugil cephalus* and *Chrisichthyes nigrodigitatus* from Sombreiro River located in Rivers State was 0.23mg/kg, 0.17mg/kg and 0.21 mg/kg respectively while Sambo *et al* (2014) reported the concentration of lead in the flesh of *Oreochromics niloticus* from Ibrahim Adamu Lake, Jigawa state, Nigeria as 0.27mg/kg and the level in the river sample as 0.81mg/l. Opaluwa *et al* (2012) reported the concentration of lead and cadmium from Uke Stream, Nasarawa State, Nigeria from different tissues of *Synodontis schall* respectively as 0.021mg/g and 0.005mg/g (head), 0.014mg.g and 0.015mg/g (gills), 0.011 mg/g and 0.026 mg/g (intestine) and 0.012 and 0.001 mg/g (flesh), while in *Clarias gariepinus*, the levels of lead and cadmium were respectively recorded as 0.031 mg/g and 0.005mg/g (head), 0.022 mg/g and 0.016mg/g (gills), 0.012mg/g and 0.025mg/g (intestine) and 0.013 mg/g and 0.001mg/g (flesh) and the corresponding water and sediment concentration were respectively recorded as 0.040mg/l and 0.095mg/g (lead) and 0.023 and 0.035mg/g (Cadmium).

The slight variation of values for the water and sediments between the findings in this study and those of previous reports could be attributed to the type of anthropogenic activities around the rivers studied, type of wastes deposited into the surface water and /or leached into the aquatic ecosystem through soil erosion.

The bioaccumulation potentials of different fish species as well as their level of tolerance could be a possible factor for the low concentration of these metals in the flesh of these species studied suggested that there may be little or no potential health hazard arising from their consumption with regard to Cadmium and Lead

The bio-accumulation factor (BWAF) values of the heavy metals analyzed in this study showed that bioaccumulation has occurred in the fish but not at an alarming rate as at the time of this study. Even though the fish samples are benthic feeder, their constant contact with the sediment does not affect its food intake to a great extent probably as a result of rapid remobilization of the adsorbed metals back into the surface waters through changes in some physicochemical parameters such as temperature, pH, and redox potentials. Also, the phenomenon that different metals are accumulated at different concentrations in the various organs of fish was

observed in this study. The variance in the level of deposits in the different organs and/or tissues of a fish can predominantly be accredited to the variations in the biological role of each organ, its comportment, regulatory ability, and feeding habits (Van der Oost et al., 2003).

For the fish organs examined, the gills have the highest concentration of all the metals, while the flesh recorded the least value and is thus the least preferred site for bioaccumulation. The high concentration of the metals in the gills could be due to element complexion with the mucus coverings in the gills which cannot be completely removed from the gill lamellae before analysis (Figueiredo-Fernandes et al., 2007). Another important influence in the total metal concentrations in the gills is the fact that metals get adsorbed onto the gills surface as the first target or point of contact for pollutants in water.

The concentrations of these heavy metals may be attributed to accumulation from the run-off of fertilizers and pesticides as well as runoff from the residential area and oil spillages from boats and canoes used at the dam (Chitou *et al*., 2021). The levels of metal in water bodies (lakes, rivers, lagoons) are mostly manipulated in the wet season by stormwater run- off from the environs on the water bodies' catchment and this ordinarily leads to a buildup in the metals. Islam *et al*. (2015) reported that metal concentration is expected to be low during the wet season due to the dilution effect on heavy metals but some site-specific activities and sources of metal contamination could lead to an exception to this general trend. Different trends of seasonal effects on heavy metal levels in water and sediments have been reported (Islam *et al*., 2015; Edokpayi *et al*., 2017; Le *et al*., 2020).

The results obtained from the assessment of these trace metals suggest that they may pose a potential toxicity problem due to the high clay content of the sediments which reduces drainage and increases the reduction of the metals. The continuous and regular intake of these finfishes collected from the Irrigation dam may likely induce health risks with regards to Cr, Pb and Cd intoxication. Although, WHO did not establish guidelines for Fe and Zn because they are not of health concern at levels found in drinking water, while Cr is an essential element that enhances the metabolism of carbohydrates, lipids and protein in humans (Udiba *et al*., 2020).

Conclusion

The study confirms that there was a significant presence of heavy metals in the commercially important finfishes collected from the Ajiwa irrigation dam. The bioaccumulation of some of these metals in the tissues of the finishes and water samples from the dam was within permissible/tolerable limits, indicating they are safe for consumption. The results obtained also revealed that the sediments accumulated metals at concentrations higher than the permissible limits. Continuous exposure of the dam to sources of these metals may pose a hazard to the end consumers (humans), as these finfishes will eventually absorb some of these metals into their edible tissue which is the main part of consumption for humans. Therefore, there is a need to regularly monitor organisms collected from these areas for metals accumulation.

Abstract

Tomato is one of the most important vegetables in the world, cultivated both in the field and in greenhouses. Orthotospoviruses, are among the most economically important pathogens of tomato and cause significant damage to this crop worldwide. Tomato spotted wilt orthotospovirus (TSWV) and Tomato yellow ring orthotospovirus (TYRV) are two species of orthotospoviruses that have been described as potential threats to tomatoes worldwide. In a study of tomato infection in greenhouses in North Khorasan province (Bojnord) with Tomato yellow ring orthotospovirus, plants with symptoms of yellowing and necrosis of leaves and necrosis of stems were observed. Infection of these samples with TYRV was confirmed using test plants, DAS-ELISA, and reverse transcription (RT)-PCR. Infection of *Petunia hybrida* and *Chenopodium quinoa* with this virus was localized, while *Nicotiana benthamiana*, *N. glutinosa*, *Datura stramonium*, and Moneymaker tomato had systemic infection. Using DAS-ELISA and a specific antibody (prepared against the nucleocapsid protein) to detect TYRV, Iris yellow spot orthotospovirus, TSWV, Impatiens necrotic spot orthotospovirus, Groundnut bud necrosis orthotospovirus, Groundnut ring spot orthotospovirus, Tomato chlorotic spot orthotospovirus, and Chrysanthemum stem necrosis orthotospovirus, *N. benthamiana* plants with systemic infection were examined and confirmed to be infected with TYRV only. In the study of samples using RT-PCR, TYRV-specific primers and total RNA extracted from infected *N. benthamiana* leaves, a fragment of approximately 825 bp in size, which included the nucleocapsid protein gene, was amplified. This fragment was sequenced (HQ154131) and a study of amino acid sequence similarity in GenBank showed that the amino acid sequence of this fragment is 99% similar to the amino acid sequence of TYRV from Fars (ABH07703), Tehran (AAV98587), and Markazi (ACT09488) provinces in Iran. This is the first report of TYRV from North Khorasan province (Bojnord) in Iran.

Key Words: *TYRV, Orthotospovirus, Bojnord, Tomato*

Introduction

Tomato is one of the most consumed vegetables in the world due to its nutrients, minerals, and antioxidants (Du et al. 2017). The area harvested of tomato in the world and Iran in 2023 is reported to be approximately 5.4 million and 74,000 hectares, respectively. In 2023, based on the latest available data, China, India, Türkiye, the United States, and Egypt are the top five tomato producing countries in the world, accounting for more than 60% of global tomato production (FAO, 2023). Tomato production is for both domestic consumption and international trade, so it is available throughout the year (Caruso et al., 2022). Monoculture conditions of tomatoes cause the emergence of many pathogens, thus threatening the quantitative and qualitative yield of production (Hanssen et al., 2010l; Caruso et al., 2022). Tomato plants are susceptible to more than 200 diseases caused by different pathogens, both in the field and after harvest (Singh et al., 2017). Fungi, oomycetes, bacteria, phytoplasmas, viruses, and viroids cause the most important tomato diseases. Plant viruses, which are one of the main causes of diseases affecting food production worldwide, are estimated to have an economic impact of more than $30 billion per annum (Sastry & Zitter, 2014; Caruso et al., 2022). The genus *Orthotospovirus*, which belong to the family *Tospoviridae* and infect more than 1000 plant species of 82 families, cause serious damage to agriculture worldwide by infecting economically important plants (Wang et al., 2022). Yellow spots, mottling, wrinkle, withering, and even death are common symptoms of plants infected by the *Tospoviridae* family (Pappu et al., 2009). Thrips transmit members of the *Tospoviridae* family in a persistent manner (Oliver and Whitfield, 2016). These viruses have a wide host range. For example, *Tomato spotted wilt orthotospovirus* (TSWV) infects over 900 species belonging to more than 90 monocotyledonous and dicotyledonous plant families (Pappu et al., 2009, Wang et al., 2022). Orthopoviruses have been known to infect various plant species in Iran (Golnaraghi et al., 2001; Ghotbi et al., 2005; Beikzadeh et al., 2012b). The host range and geographic distribution of species of the genus *Orthopovirus* are increasing (Pappu et al., 2009) and in recent years, new species belonging to this genus have been proposed (Zarzynska-Nowak). One of these species is *Tomato yellow ring orthotospovirus* (TYRV), which was first identified on tomato in Iran (Hassani-Mehraban et al., 2005), and later detected in other plants such as potato, soybean, chrysanthemum, cineraria, gazania, anemone, and alstroemeria in Iran (Hassani-Mehraban et al., 2007; Rasoulpour and Izadpanah, 2007; Golnaraghi et al., 2008; Beikzadeh et al., 2012a; Mortazavi et al., 2013). The virus has also been reported

from Poland and Kenya (Birithia et al., 2012; Zarzyńska-Nowak et al., 2016) and has a wide host range, including ornamentals, weeds, and economically important crops in the Solanaceae and Fabaceae families. Tomato yellow ring orthotospovirus infects crops grown in the field and protected environments (Karavina, 2022). In most plants, this virus causes necrotic lesions on leaves and stems, which leads to a decrease in the quality and quantity of the products. On infected tomato fruits, bright yellow ring patterns are formed (Hassani-Mehraban et al., 2005). This study was conducted to detect this virus in tomato greenhouses in North Khorasan province, Iran.

Materials and Methods

During this study, greenhouse-grown tomato plants with symptoms of yellowing and necrotic leaves resembling those associated with orthotopoviruses, were observed in North Khorasan province (Figure 1).

Figure 1. Symptoms of infection on tomato leaves

Fresh leaves of the infected plants were ground with cold 0.01M phosphate buffer (pH 7.0) containing 0.1% sodium sulfite. The plant sap was mechanically inoculated onto the test plants. The inoculated plants were maintained for one to two weeks under normal greenhouse conditions for symptom expression (Hassani-Mehraban et al., 2005). The symptomatic plants were tested by double antibody sandwich (DAS)-ELISA using polyclonal antisera (Wageningen university) against the eight of the most important orthotopoviruses: TYRV, TSWV, *Iris yellow spot orthotopovirus* (IYSV), *Impatiens necrotic spot orthotopovirus* (INSV), *Groundnut bud necrosis orthotopovirus* (GBNV), *Groundnut ringspot orthotopovirus* (GRSV), *Tomato chlorotic spot orthotopovirus* (TCSV), and *Chrysanthemum stem necrosis orthotopovirus* (CSNV). The absorbance of the yellow reaction mixture at 405 nm is then read using an ELISA plate reader (Clark and Adams, 1977; Williams et al., 2001; de Ávila et al., 1990). The presence of TYRV in ELISA-positive *Nicotiana benthamiana* plants with systemic symptoms was further confirmed by conventional reverse transcription (RT)-PCR using specific primer [N-start: 5'-ATGGCTACCGCACGAGTG-3'(F) and N-stop: 5'-TTAAAATGCATC-3'(R)] complementary to the N gene. The primer pair supposed to amplify about 825 bp fragment (Hassani-Mehraban et al., 2005). Total RNA was extracted from *N. benthamiana*-infected plants using Trizol reagent as recommended by the manufacturer's instructions (Invitrogen) and used as template for cDNA synthesis. PCR reactions were performed by pre-heating at 94ºC for 5 min followed by 30 cycles of 30 sec of denaturation at 92ºC, 30 sec of annealing at 55ºC and 1 min for extension at 72ºC. Finally, the amplified DNA was incubated at 72ºC for 7 min to accomplish a final extension. The PCR reactions were subjected to electrophoresis in 1% agarose gel in TAE buffer and then stained with ethidium bromide (Pozzer et al., 1999; Eiras et al., 2001). The PCR product was purified (GFX™ PCR DNA and Gel Band Purification Kit; GE Healthcare UK Limited) and sequenced (Sanger et al., 1977). Sequence data were compared with those available in GenBank, using NCBI/BLAST, to search for related sequences.

Results

The results obtained from experimental host range studies by mechanical inoculation are summarized in Table 1. Systemic infection of inoculated *N. benthaminana* were confirmed using DAS-ELISA. Of the eight antibodies prepared against the N protein of different orthotospoviruses used in this test, the TYRV antibody reacted positively with extracts prepared from *N. benthaminana* samples (Figure 3). No positive reactions were observed with antibodies to other orthotospoviruses.

The infection of *N. benthamiana* with TYRV was confirmed using PCR. In the PCR test using primers designed based on the N gene of this virus, this gene was amplified and after electrophoresis in agarose gel, a DNA fragment of about 825 bp was observed. No band was observed in the negative control (healthy) sample (Figure 4).

Symptoms observed on the collected samples included yellowing and necrosis of tomato leaves. The characteristic symptoms of plant infection with orthotospoviruses are usually diverse and include chlorotic and necrotic lesions, mottling, leaf deformation, systemic necrosis, vein yellowing, and ringspot (Peters and Goldbach, 1995; Kritzman et al., 2001; Ghent et al., 2004; Ghent et al., 2006). The collected tomato samples showed symptoms similar to those of orthotospoviruses infection. These samples were identified as infected with orthotospoviruses using host range, serology, and polymerase chain reaction tests.

Table 1. Reaction of several host plants to virus infecting tomato after mechanical inoculation.

Test Plant	Symptoms	
	local	systemic
Petunia hybrida	NL	–
Nicotiana benthamiana	CS	Mo, LD, LN
Datura stramonium	CS	Mo, NS
Chenopodium quinoa	NL	–
N. glutinosa	NS	NS
Moneymaker tomato	NS	LY, LN

CS: chlorotic spot, LD: leaf deformation, LN: leaf necrosis, LY: leaf yellowing Mo: mottling, NL: necrotic lesion, NS: necrotic spot, -: no reaction

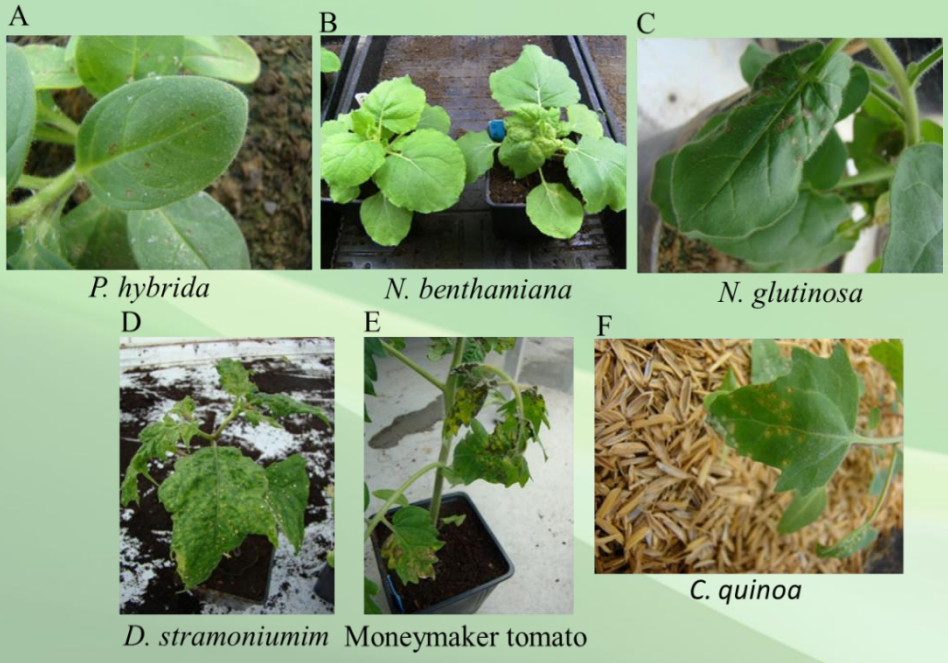

Figure 2. Symptoms of infection on test plants

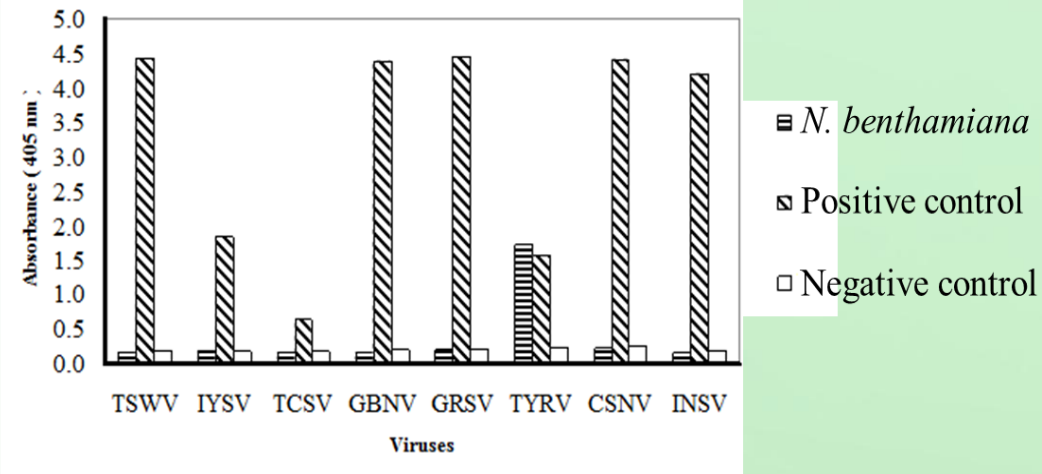

Figure 3. Mean absorbance of *N. benthaminana* sample, positive and negative controls at 405 nm

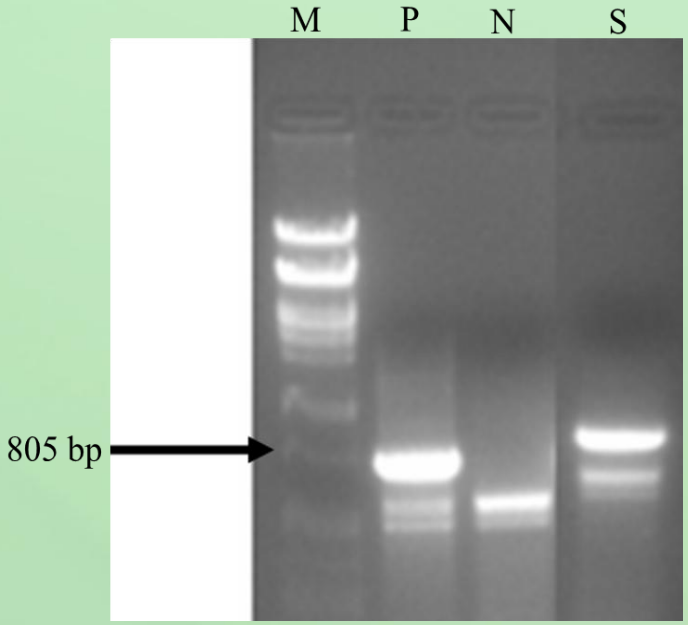

Figure 4. PCR result (M: marker, P: positive control, N: negative control, S: *N. benthamiana*)

Discussion

Host range studies showed that the tomato pathogen is mechanically transmitted. Symptoms of infection on *Petunia hybrida* and *C. quinoa* appeared as localized necrotic spots, while on *N. benthamiana*, *N. glutinosa*, *D. stramoniumim* and Moneymaker tomato they were systemic (Figure 2). Therefore, symptomatology and host range indicates that the samples examined were infected with an orthotospovirus and our results are consistent with several prior studies (Bezerra et al., 1999; Hassani-Mehraban et al., 2005; Rasoulpour & Izadpanah, 2007; Dong et al., 2008; Zheng et al., 2008; Ciuffo et al., 2009; Hassani-Mehraban et al., 2010).

The N-start primer is identical to the first 18 nucleotides of the N gene of TYRV from Iran with accession number AY686718, and the N-stop primer is complementary to the last 12 nucleotides of this gene in this virus. This gene has 825 nucleotides (Hassani-Mehraban et al., 2005), so it is expected that a fragment of 825 bp will be amplified in the PCR test. The amino acid sequence of the N protein reported in this study has been submitted to GenBank under Acc. No. HQ154131. A BLAST search showed that this fragment had 99% identity to TYRV from Markazi (GenBank Acc. No. ACT09488) and Fars (GenBank Acc. No. ABH07703) provinces and TYRV-t from Tehran (GenBank Acc. No. AAV98587) province in Iran. Since the amino acid sequence similarity of the N protein between a new virus and other confirmed orthotospoviruses must be less than 90% to be confirmed as a new species (de Ávila et al., 1990), the isolate examined in this study is not a new species and is confirmed as a Tomato yellow ring orthotopovirus solate based on the amino acid sequence similarity of the N protein.

Abstract

Climate change presents severe global challenges, with regions like Africa experiencing long-term shifts in temperature, precipitation, and wind patterns. Over the past two decades, rising surface temperatures and sea levels have been key indicators of this change, significantly affecting livestock production, a vital sector for rural livelihoods. Livestock farming, which relies on climate and natural resources, is particularly vulnerable, with rural farmers facing considerable risks despite its crucial role in food security and income. Studies on climate change's effects on livestock productivity emphasise the importance of temperature and precipitation, noting that higher temperatures typically reduce productivity, while droughts caused by reduced rainfall further exacerbate the challenges. On the other hand, increased rainfall benefits livestock by improving water availability and forage growth. Recent studies indicate that climate change negatively impacts livestock at the microeconomic level. However, the complexities of these effects, particularly the influence of socioeconomic factors such as market volatility, population growth, and conflicts, have not been thoroughly explored. As the climate crisis escalates, reliable data and effective adaptation strategies become increasingly important to mitigate these risks and ensure the long-term sustainability of livestock farming in Africa. Therefore, this study aims to study climate change and African livestock production. It is essential to expand research to include underrepresented livestock regions. Effective responses to climate change must be context-specific and holistic, with a more diversified focus addressing the impacts on non-ruminant livestock. It is crucial to conduct more research on the effects of climate change on livestock in some detail to develop practical solutions that support the resilience of rural livestock communities in Africa.

Key Words:

Introduction

Climate change continues to be a significant concern globally, posing risks to peace and economic stability. The Intergovernmental Panel on Climate Change (IPCC) predicts that global average surface temperatures will rise soon, while rainfall patterns have grown more unpredictable. In Africa, data from the World Meteorological Organization and the IPCC reveal that the continent has experienced the highest increase in average surface temperatures worldwide (IPCC, 2022). Climate change is emerging as a critical global developmental issue, with SSA expected to face particularly severe effects due to limited resources and adaptive capacity. These impacts are evident in extreme events like floods, storms, heat waves, and droughts (Archer et al., 2021). In South Africa, climate models suggest that temperatures could rise between 5°C and 8°C by 2050, with projections of more hot days, fewer cold spells, reduced overall rainfall, and potentially increased rain along the southern coast. Agriculture, which depends on stable climate conditions, is especially vulnerable to these changes. Given its role in contributing about 3% to South Africa's GDP, any agricultural disruption significantly impacts the economy (Nyoni et al., 2022). Furthermore, over 80% of the land in South Africa is non-arable and better suited for livestock farming, which supports the livelihoods of many rural and landless communities (Vetter et al., 2020). The country has a rich diversity of livestock, with approximately 12.8 million cattle, 19 million sheep, 1.8 million goats, and 1.5 million pigs. However, climate change's effects on livestock—such as higher death rates, slower growth, and reduced milk production—are causing serious challenges for South African livestock farmers (Maluleke et al., 2020). Due to the scarcity of land for new agricultural projects and increasing concerns over deforestation and climate change (Bagdatlı & Belliturk, 2016), temperature and precipitation are considered the most critical climatic factors and extreme events (Nasreldin and Elsheikh, 2022). Seasonal temperature fluctuations are slight; however, there is a significant decline in precipitation and the rainy season's length (Elsheikh, 2021; Elsheikh et al., 2022a). In South Africa, farmers with limited resources manage over half of the livestock population within smallholder traditional farming systems. These systems mainly support unemployed and retired individuals and children who benefit from selling livestock and animal products such as meat and milk. Although livestock farming is vital in enhancing the livelihoods of low-income populations, it operates under challenging environmental conditions that often limit productivity (Musemwa et al., 2012). Strengthening the resilience and efficiency of communal livestock systems is crucial for sustainable production and reducing food insecurity (Elsheikh et al., 2023; Bagdatlı et al., 2023). Livestock also has the potential to enhance climate resilience, often being more adaptable to changing

conditions than crop-based systems. However, to improve livestock's resilience, a deeper understanding of how climate change affects rural farming communities is essential (Maluleke et al., 2020). Effective policies and practices require detailed, sector-specific data on the range and scale of climate impacts, as these vary among livestock systems. Understanding these variations is vital to creating policies and interventions well-suited to specific needs (Archer et al., 2021). Coordinating climate impact knowledge and adaptation efforts across different levels helps identify shared challenges and fosters collaboration among production systems (Elsheikh et al., 2024). Additionally, gaps in research on climate adaptation in rural livestock production limit the sector's ability to anticipate and respond to climate impacts and track progress in adaptation efforts over time (Maluleke et al., 2020). Assessing the effects of climate change on various components of the water cycle is crucial for managing this essential resource, as water availability is increasingly strained due to growing societal demand (Elsheikh et al., 2022b; Bagdatlı & Arslan, 2019; Bagdatlı & Can, 2019).

While the livestock sector in Africa is highly complex, research on climate change's impact on rural communities has lagged compared to studies on crop production, and available evidence remains fragmented. Consistent data on climate-related damages and losses in the livestock sector is threatened. Livestock data is inherently challenging due to diverse production systems, agro-ecological zones, and differing production goals. Moreover, practices across livestock systems vary widely, shaped by cultural, socioeconomic, and institutional factors. Given its wide-ranging socio-economic and cultural benefits, livestock's role in Africa's development agenda is crucial. Despite ongoing efforts, climate change threatens rural livestock production, demanding urgent action (Zhou et al., 2022). This study seeks to address these knowledge gaps by systematically reviewing existing literature on climate change's effects on livestock production and pinpointing gaps that hinder effective adaptation strategies in rural South Africa and Sub-Saharan Africa (SSA) communities.

Climate change and livestock production in Africa

South Africa

Concerns around global climate change are escalating worldwide, with no country spared from its impacts, though vulnerability varies across regions. South Africa faces this challenge, with climate change marked by long-term temperature, precipitation, and wind patterns shifts. Over the last two decades, rising surface temperatures and sea levels have been central indicators of this change. Among agricultural sectors, livestock is particularly vulnerable due to its dependence on climate and natural resources, making rural livestock farming highly risky despite its importance for socio-economic livelihoods in rural areas. This growing climate impact on livestock has captured the attention of researchers, policymakers, and activists in South Africa (Zhou et al., 2022).

The livestock production sector in South Africa is highly vulnerable to climate risks, with both past and ongoing case studies highlighting the severity of these impacts. In the Suid Bokkeveld, an arid region in western South Africa where livestock is a primary source of income for most farmers, a participatory research study investigated the effects of climatic risks on small livestock. The study included weekly condition assessments, behavioral observations, and weather data measurements. The findings revealed significant lamb mortality due to cold conditions and a loss of condition during the dry season, primarily in summer. However, there is some overlap with cross-over summer rainfall (Archer et al., 2021). In the Limpopo region, Stroebel et al. (2011) observed that the impacts of drought were particularly evident in cattle herds, including significant effects on herd health and size. The study specifically focused on whether to cull or sell cattle, finding that such decisions are complex and influenced by how cattle are viewed and valued. Understanding these factors is crucial for making recommendations on managing cattle herd sizes in response to climatic risks.

The available literature highlights the importance of livestock to resource-limited communities, stressing the urgency for adaptation strategies to counter climate risks. Analysis of studies on climate shocks and adaptive responses is crucial for pinpointing priority areas within livestock production that need immediate action. The impact of climate change on rural livestock has gained significant attention since the 2000s, especially after a severe El Niño event triggered one of South Africa's worst droughts in 35 years, leading to disaster declarations in eight provinces. Public debates and policy discussions at all levels intensified as rural livestock farmers faced substantial production and financial losses exacerbated by the drought (Zhou et al., 2022).

From 2013 to early 2016, seven of South Africa's nine provinces reported a 14.4% decline in cattle herds due to climate stress (Maluleke & Mokwena, 2017). Farmers' debts rose by 9%, and feed costs skyrocketed by 177% as farmers struggled to sustain their core herds, many relying on costly feed purchases. Drought forecasting challenges and the reluctance to sell livestock assets further complicated the situation, with poor body conditions and market saturation resulting in low prices, unsold animals, and increased deaths. Predicting climate change risks remains complex, with climatic, ecological, and socio-economic factors influencing livestock losses. The scarcity and reliability of current data on climate effects in communal livestock farming are under scrutiny as climate scientists and policymakers seek more comprehensive and dependable information (Taruvinga et al., 2013).

Sub-Saharan Africa

Livestock production is essential for sustaining populations and diversifying rural communities, helping them cope with declining crop yields. However, recent crises—such as the COVID-19 pandemic and the Russo-Ukrainian war—pose additional threats to livestock production across Sub-Saharan Africa, compounding the adverse effects of climate change. COVID-19 restrictions, including social distancing and lockdowns, limited access to livestock markets, driving up production and feed costs for farmers unable to sell their livestock. The pandemic also restricted access to essential animal feed, veterinary care, and reproductive supplies, all critical for livestock production (FAO, 2020). Furthermore, the Russo-Ukrainian conflict has driven up wheat prices, affecting livestock feed costs and, subsequently, the quality and cost of beef production, as wheat is a primary feed ingredient (Ateba Boyomo et al., 2024).

Animal welfare and production ecology are valuable for analyzing climate change's effects on livestock production. Empirically, studies have shown climate change's negative impacts on livestock at the microeconomic level. However, these studies have limitations. For instance, while Emediegwu and Ubabukoh (2023) identify climate change transmission channels—such as maize prices, water scarcity, agricultural output, and conflict—they do not empirically test these factors. Additionally, the empirical literature on climate change has established that two-way fixed-effects panel data models are preferable to fixed-effects models, as they address omitted variable issues and reduce unobserved heterogeneity among individuals within a dataset (Ateba Boyomo et al., 2024).

Godde et al. (2021) highlight the significant influence of climate change on livestock production. Studies like Habte et al. (2022) and Emediegwu and Ubabukoh (2023) show that rising temperatures negatively impact livestock production in Sub-Saharan Africa, while research by Feng et al. (2021) reveals a positive correlation between rainfall and livestock productivity. Increased rainfall supports livestock production by ensuring animal water availability and forage growth, boosting productivity. Conversely, in Africa, reduced precipitation—and consequently, lower water availability—leads to declining livestock production, a pattern mirrored by the effects of rising temperatures, as drought often results from reduced rainfall. The World Meteorological Organization (WMO, 2022) confirms drought's severe impact on livestock in the Horn of Africa, including countries like Ethiopia, Kenya, and Somalia.

According to Mbow et al. (2019), increased volatility in cereal prices leads to reduced livestock production. The FAO's May 2022 quarterly bulletin supports this, reporting a 12.6% rise in food prices in West and Central Africa from February to March 2022. This increase is attributed to reduced wheat production in the drought-prone Sahel and the effects of the Ukraine conflict. Additionally, studies like Aragón et al. (2021) show that agricultural productivity positively affects livestock production. However, as Rehman et al. (2017) point out, population growth can reduce livestock production due to rapid urbanisation and demographic pressures across Africa, where climate shocks, conflicts, and tropical diseases worsen livestock scarcity.

Conclusion

With the right adaptation strategies, livestock can play a significant role in food security and sustainable development. Climate change is now a pressing challenge, particularly for underprivileged rural populations who rely directly on livestock for survival. The study suggests expanding research to cover more geographic areas and including non-ruminant species affected by different climate stresses. To respond effectively to climate impacts, mitigation strategies should be context-specific and holistic, aiming to enhance livestock production within rural farming communities.

Drought, a primary climate stressor, has prompted adaptive strategies like destocking, supplementary feeding, breed improvements, and diversification efforts. Expanding research to cover underrepresented livestock regions is essential. Effective climate change responses must be tailored and comprehensive, with more diversified research to include the effects on non-ruminant livestock. This paper emphasizes that response capacities will likely be underestimated without clarity on the extent of climate impacts. Additional focused research on adaptation and mitigation is crucial to creating practical solutions for rural livestock communities.

Production and Quality Evaluation of Artisan Spaghetti Incoporated with Xanthan Gum and Eggs

Tasiu[1], Y. G., Alalade[2], O.M., Atiku[3], M.K and Dawi[4], A. W

[1]National Agricultural Extension and Research Liaison Services, Zaria, [2]Aliko Dangote University of Science and Technology, Wudil, Kano, Nigeria. [3]Bayero University, Kano State, Nigeria. [4]Federal College of Agricultural Produce Technology, Kano State

Abstract

Locally processed spaghetti is often associated with low mechanical strength and proximate composition. Xanthan gum (XG) and eggs are used by food industries to improve textural properties and nutritional value of foods. Locally processed spaghetti from three different formulation of wheat flour dough consisting XG and egg (3g, 50ml; 2.5g, 40ml; 2g, 30ml) and control sample with neither XG nor egg were produced. The effects of XG and egg on textural properties, proximate composition, and sensory attributes of the spaghetti were analyzed. Proximate composition were determined using standard methods, texture of dry spaghetti was evaluated using fracturability test method, while for the cooked spaghetti texture analyzer machine was used. The sensory profile was investigated using 9-point hedonic scale method. The results showed that incorporating xanthan gum and egg to wheat flour during dough formation significantly modified the properties of the processed spaghetti. There was increased in protein (26.17%), and fat contents (8.07%) compared to the control spaghetti. Sample with higher XG and gum exhibit more hardness (19.01%), cohesiveness (1.39%), and fracturability (78.11%). XG improved mechanical strength of the dried spaghetti, hardness (19.01%), cohesiveness (1.39%), and fracturability (78.11%) compared to other samples. However, sensory evaluation highlighted a need to manage the aroma due to the eggy smell. This research highlights the potential of xanthan gum and egg as functional additives to enhance the quality, textural and sensory properties of locally processed spaghetti. The findings provide a foundation for scaling up production and improving the competitiveness of local pasta producers in the market.

Key Words: *Xanthan Gum, Egg, Spaghetti quality and Textural characteristics*

Abstract

Postharvest fungal diseases in mandarin fruits cause significant economic and nutritional losses during transport and storage. The control of postharvest diseases in citrus fruit involves frequent and large amounts of chemical fungicides. Increasing concerns about health hazards and environmental pollution caused by the use of chemicals have necessitated the development and use of environmentally friendly control strategies as an alternative to chemicals for the control of post-harvest diseases in citrus fruits. The bacterial isolates as biological control agents (BCAs) are one of the most suitable alternatives to synthetic fungicides, which are banned or restricted for use in post-harvest disease management. Fungal diseases such as black mould (*Aspergillus niger*), blue mould (*Penicillium italicum*), green mould (*Penicillium digitatum*), sour rot (*Geotrichum citri-aurantii*), and anthracnose (*Colletotrichum gloeosporioides*) cause the most significant postharvest losses in citrus fruit. The BCA bacterial isolate used in this study was isolated from healthy mandarins and identified as *Burkholderia ambifaria* by Matrix Assisted Laser Desorption Ionisation Time of Flight-Mass Spectrometry (MALDI TOF MS; MicroFlex LT, Bruker Daltonics, Bremen, Germany) analysis. In this study, the antagonistic activity of *B. ambifaria* on the inhibition of mycelial growth of *A niger, P. italicum, P. digitatum, G. citri-aurantii* and *C. gloeosporioides* isolated from mandarin fruits was determined *in vitro* conditions. In dual culture tests, the BCA *B. ambifaria* isolate inhibited the mycelial growth of *C. gloeosporioides* by 66.67%, *A. niger* by 69.40%, *G. citri-aurantii* by 73.33%, *P. italicum* and *P. digitatum* by 77.78%. The high level of antagonistic activity of the bacterial isolate in inhibiting the mycelial growth of fungal pathogens showed that the *B. ambifaria* has the potential to be used as a BCA against diseases occurring during post-harvest storage.

Abstract

Field trials were conducted over two consecutive growing seasons at the Research and Teaching farm of the Faculty of Agriculture, Bayero University Kano (Latitude 11° 58 N, Longitude 8° 25 E; altitude 458 m als). The efficacy of twelve different weed control treatments using various herbicides alone, in combination, or in addition to hoe weeding was evaluated on cowpea (var. IT99K-573-1-1) in a randomized complete block design (RCBD) with three replications. The treatments comprised of weedy check (control), hoe weeding at 3 & 6 weeks after sowing (WAS), metolachlor at 2.0 kg a.i.ha^{-1}, imazethapyr at 3.0 kg a.i.ha^{-1}, pendimethalin at 2.0 kg a.i. ha^{-1}, pendimethalin at 3.0 kg a.i. ha^{-1}, pendimethalin 1.0 + imazethapyr 1.0 kg a.i.ha^{-1}, metolachlor 1.5 + pendimethalin 1.5 kg a.i.ha^{-1}, imazethapyr 1.0 + pendimethalin 1.0 kg a.i.ha^{-1} + SHW at 6 WAS, metolachlor 1.5 + pendimethalin 1.5 kg a.i.ha^{-1} + SHW at 6 WAS, metolachlor at 2.0 + SHW at 6 WAS, and pendimethalin at 2.0 + SHW at 6 WAS. Data were collected on cowpea growth, yield, and weed management parameters and were subjected to analysis of variance (ANOVA), and treatment means were compared using the Student Newman-Keuls test (SNK) at a 5% level of probability. Results indicated that weed control significantly ($p < 0.001$) influenced crop growth and yield. Herbicide treatments, particularly those involving pendimethalin, imazethapyr, and metolachlor, effectively suppressed weed growth, leading to increased plant height (101.9-147.9 cm), leaf area (44.87-47.93 cm^2), and number of leaves (113.17-122.03). Additionally, these treatments resulted in a higher number of pods (74.47-77.10) and seed yields (702.0-705.5 kg ha^{-1}) compared to the weedy check. Findings further revealed that the combination of herbicides with hoe weeding proved to be the most effective strategy, providing superior weed control and maximizing crop productivity. These findings highlight the importance of integrated weed management practices for sustainable cowpea production.

Key Words: *cowpea, integrated weed management, sustainable, weed control index*

Introduction

Cowpea (*Vigna unguiculata* L. Walp; Fabaceae) is a vital legume with widespread cultivation in Nigeria, playing a pivotal role in both subsistence farming and commercial agriculture. Its resilience to drought conditions and ability to thrive in nutrient-poor soils have established it as a valuable crop, particularly in regions facing these challenges (Ojo *et al*., 2018; Adediran *et al*., 2021). In recent years, the sustainable management of weeds in cowpea production systems has become a significant agricultural challenge in Nigeria.

The expected yield of the crop is considerably diminished by biotic and abiotic stresses, including edaphic factors, drought, cultivar selection, pest and disease infestations, with infestations by weeds being a significant contributor (Liliane and Charles, 2020; Anwar *et al*., 2021; Skendžić *et al.,* 2023). Uncontrolled weed infestation has been reported to cause a 90% reduction in the yield of cowpea (de Campos *et al*., 2023). Among the methods available for checkmating the weed infestation in cropping systems, chemical methods using preemergent herbicides are preferred due to efficiency, selectivity, and reduced drudgery. However, pre-emergence therapies alone are inadequate for preventing weed flushes through the rainy season, thus needing post-emergence therapy following pre-emergence control (Shittu, 2023; Shittu et al., Shittu and Bassey, 2023; Shittu and Lamarana, 2024).

The excessive use of herbicides has led to a myriad of environmental concerns, including water pollution, biodiversity loss, and the emergence of herbicide-resistant weeds (Nwafor *et al*., 2018; Nath *et al*., 2024). These adverse consequences necessitate the exploration of alternative weed control strategies. Addressing these challenges is crucial to ensuring the sustainability of cowpea production, particularly in the face of climate change and increasing global food demands. Integrated weed management (IWM) has emerged as a promising approach to address these challenges. IWM is a holistic strategy that combines various methods to control weeds while minimizing negative impacts on the environment and agricultural productivity. By integrating cultural, biological, and chemical control measures, IWM aims to create a more sustainable and resilient agricultural system (Olowe *et al*., 2020; Adebayo *et al*., 2022).

Additionally, combining cultural practices such as supplementary hoe weeding to broaden the spectrum efficacy of the preemergence herbicide will greatly enhances weed suppression and improves grain yield of cowpea. Thus, the study evaluated herbicide treatments and hoe weeding in Nigeria's cowpea farming system, aiming to improve weed control and crop yield using an integrated approach. The research aimed to determine the optimal combination of herbicides for sustainable weed management, influencing the development of more effective practices in a sustainable manner in the Sudano- Sahelian region of Nigeria.

Materials And Methods

The experiments were conducted during 2019 and 2020 rainy season at the Research and Teaching farm of the Faculty of Agriculture, Bayero University Kano (Latitude 11° 58 N, Longitude 8° 25 E; altitude 458 m als), in a randomized complete block design (RCBD) with three replicates. The soil at the experimental site was sandy loam with low accessible N (0.06 g kg^{-1}), low levels of P (4.87 g kg^{-1}) and medium levels of K (0.32 g kg^{-1}). The gross plot was 3 x 4.5 m (12 m^2) which is made up of six ridges (rows) while the net plot size was 1.5 m x 3 m (4.5 m^2) comprising the two inner rows with an alley of 0.5 m and 1.0 m between the plots and replications, respectively. The effectiveness of twelve different weed control treatments using various herbicides alone, in combination, or in addition to hoe weeding on cowpea (var. IT99K-573-1-1) was assessed. Every year, the crop was sown in the first week of July at a seed rate of 75 kg ha^{-1}, and treated two weeks later with NPK (15:15:15) and SSP (18%) at a rate of 20 kg N, 40 kg P_2O_5, and 20 kg K_2O ha^{-1}. The SSP was however applied during land preparation. Herbicidal treatments were applied as per treatment. The details of the treatments were as follows: weedy check (control), hoe weeding at 3 & 6 weeks after sowing (WAS), metolachlor at 2.0 kg a.i.ha^{-1}, imazethapyr at 3.0 kg a.i.ha^{-1}, pendimethalin at 2.0 kg a.i. ha^{-1}, pendimethalin at 3.0 kg a.i ha^{-1}, pendimethalin 1.0 + imazethapyr 1.0 kg a.i.ha^{-1}, metolachlor 1.5 + pendimethalin 1.5 kg a.i.ha^{-1}, imazethapyr 1.0 + pendimethalin 1.0 kg a.i.ha^{-1} + SHW at 6 WAS, metolachlor 1.5 + pendimethalin 1.5 kg a.i.ha^{-1} + SHW at 6 WAS, metolachlor at 2.0 + SHW at 6 WAS, pendimethalin at 2.0 + SHW at 6 WAS. The herbicidal treatments either alone or in mixture were applied pre-emergence on the tested crop. Data were collected on weed attributes, crop growth and yield related characters which were subjected to analysis of variance (ANOVA) and treatment means were separated using Student Newman-Keuls-test (SNK) at 5% level of probability.

Results And Discussion

Crop Injury Scores and crop vigor

Table 1 presents the effect of weed control methods on crop injury score and crop vigor of cowpea during the 2019 and 2020 seasons and the combined. Results show that the weedy check and the plots that received hoe weeding at 3 and 6 WAS consistently resulted in the lower injury score compared to all other herbicidal treatments, either alone or integrated with hoe weeding at 6 WAS or tank mixture that resulted in slightly higher injury scores during the 2019 and 2020 rainy seasons and the combined. On the other hand, weedy check plots had significantly ($p < 0.001$) the lowest crop vigor scores compared to all other treatments across all seasons combined. The highly significant crop injury scores obtained between treatments, including the weedy check, are a positive finding. This aligns with research by Ribeiro Junior *et al.* (2018), who found that herbicides, when applied according to recommended rates and timings, generally cause minimal to no injury to cowpea plants. This suggests that the weed control methods tested in this study were safe for cowpea at the observed time (6 WAS), and it is highly selective to the crop. Similar findings were reported by Pedroso *et al.* (2020) and Correia and Carvalho (2021) in soybean and sweet potato, respectively.

Similarly, the clear distinction between treatments in terms of crop vigor is noteworthy. Weedy check plots consistently resulted in the lowest vigor scores compared to other treatments that resulted in statistically comparably higher vigor scores. This suggests that hoe weeding at 3 and 6 WAS and other herbicidal treatments provided the most effective weed control, allowing the cowpea plants to thrive with minimal competition for growth resources. The similar vigor scores observed with Imazethapyr, Pendimethalin, and some herbicide combinations compared to hoe weeding are promising. These findings align with studies by Anna Bárbara de *et al*. (2020) and Sinchana and Raj (2020), who reported that Imazethapyr and Pendimethalin effectively controlled weeds in cowpea, leading to improved crop growth and yield. Thus, these herbicidal treatment combinations may offer valuable alternatives to hoe weeding, particularly in situations where manual labor is limited.

Plant height and Number of Leaves

The impact of various weed control treatments on plant height and number of leaves of cowpea at 9 WAS across two growing seasons (2019 and 2020) and the combined is shown in Table 2. There was no significant ($P > 0.05$) variation in plant height during the 2019 and 2020 seasons. However, the weedy check plots resulted in the shortest plants, while all other treatments were not statistically comparable and taller when the seasons were combined. The observed significant differences in plant height between treatments highlighted the importance of weed control for cowpea growth. This corroborates the findings of Sinchana and Raj (2020), who reported that weed competition significantly reduced cowpea plant height compared to weed-free plots. The tallest plants were observed in the imazethapyr + pendimethalin

(1.0 + 1.0 kg a.i.ha^{-1} + SHW) treatment, followed by the pendimethalin (2.0 kg a.i.ha^{-1} + SHW) treatment. This suggests that these herbicide combinations, particularly when combined with SHW, were highly effective in controlling weeds, allowing cowpea plants to grow taller with less competition for growth resources. Conversely, the weedy check plots and plots treated solely with pre-emergence herbicide had statistically similar plant heights, indicating potential growth suppression due to unchecked weed competition that occurs later in the growing season. This finding agreed with those of Shittu (2023), Shittu and Bassey (2023), Shittu *et al.* (2023), and Shittu *et al.* (2024), who reported separately the inability of pre-emergence alone to provide season-long weed control in comparison with plots that received supplementary hoe weeding at 6 WAS or post-emergent herbicide, which cumulatively increase the efficacy of the weed control treatments in tomato, cowpea, and roselle and cucumber, respectively. Similarly, the weedy check plots had the lowest number of leaves ($P < 0.001$) when the years were combined, but plots treated with Pendimethalin at 2.0 kg a.i. ha^{-1} *fb* hoe weeding at 6 WAS recorded the highest number of leaves per plant, although at par with other treatments.

Table 1. Crop injury score and Crop vigor score of cowpeas as influenced by Weed control treatments during 2019 and 2020 rainy season

Treatment	Crop injury scores @ 6 WAS			Crop vigor scores @ 9 WAS		
	2019	2020	Combined	2019	2020	Combined

The findings on the number of leaves suggest a potential positive influence of this treatment on leaf production. It's possible that hoe weeding minimizes herbicide-plant contact, which reduces herbicide phytotoxicity, ultimately leading to less stress on the cowpea plants and allowing for better growth. This is inline with the findings of Galon *et al*. (2021), who reported the increase in growth characters of canola and suppression of weed growth. The lack of a significant difference in the 2019 and 2020 seasons could be due to environmental factors or require a longer observation period beyond 9 WAS to detect variations in leaf production between treatments.

Leaf Area and Leaf Area Index

Table 3 presents the influence of various weed control treatments on leaf area and leaf area index (LAI) of cowpea at 9 WAS across two growing seasons (2019 and 2020) and combined. The result demonstrated that the weedy check plots had the smallest leaves overall. In both years, several treatments significantly ($P < 0.001$) resulted in the larger leaves, including a combination of herbicide and hoe weeding. Overall, the application of pendimethalin and metolachlor, each at 2.0 kg a.i.ha^{-1} + SHW at WAS, the combination of imazethapyr + pendimethalin (1.0 + 1.0 kg a.i.ha^{-1}) + SHW at 6 WAS, and metolachlor + pendimethalin (1.5 + 1.5 kg a.i.ha^{-1} + SHW) significantly resulted in larger leaves, which were at par with other treatments in the 2019 season. A similar trend of results was equally observed during the 2020 season as well as the combined effect. This suggests that the treatments with hoe weeding were particularly effective in controlling weeds, allowing cowpea plants to develop larger leaves with less competition for light and other growth resources. Conversely, the weedy check plots had the lowest leaf area, indicating limitations on leaf growth likely due to weed competition. This aligns with research by Enejoh *et al*. (2018), who found that uncontrolled weeds significantly reduced cowpea leaf area compared to weed-free plots.
Similar to leaf area, the leaf area index (LAI) results showed significant differences between treatments, mirroring the trends observed with leaf area. LAI is a critical parameter reflecting the canopy's light interception capacity, which directly influences photosynthesis. The lower LAI observed in the weedy check plots suggests reduced light interception and potentially lower photosynthetic potential, ultimately impacting plant growth and yield. The result is consistent with those of Saberali *et al*. (2016) and Bisikwa *et al.* (2021), who found that weed competition dramatically lowered cowpea LAI, which in turn led to lower biomass output. As such, crop canopy expansion and competitiveness for solar radiation and production of dry matter can be enhanced by suppression of weed growth within the crop canopy as emphasized by Evers and Bastiaans (2016). Similarly, Ibitoye *et al*. (2020) reported that employing integrated weed management strategies involving hand weeding or mechanical weeding combined with herbicides resulted in a greater leaf area and LAI in cowpea compared to herbicide application alone, which might be attributed to increased spectrum activity of the pre-emergence herbicides to smother the growth of the late-emerging weeds.

Number of pods per plant and Number of seeds per pod

The influence of various weed control treatments on cowpea yield-related characters is presented in Table 4. Results revealed that the application of 2 HW at 3 and 6 WAS, Pendimethalin and Metolachlor, each at 2.0 kg a.i.ha^{-1} + SHW at 6 WAS, significantly ($P < 0.001$) resulted in a higher number of pod plants, although at par with

other treatments compared to the weedy check that had lower values in the 2019 and 2020 seasons and the combine. On the other hand, the application of metolachlor at 2.0 kg a.i.ha^{-1} + SHW at 6 WAS significantly ($P < 0.001$) produced the highest number of seeds per pod, which was comparable with the rest of the treatments, although the weedy check resulted in a lower seed number per pod in both seasons and combined.

Seed Yield and Seed Quality

Table 5 examines the influence of various weed control treatments on cowpea seed yield and hundred seed weight (g) across two years (2019 and 2020) and combined data. The weedy check had the lowest yield across all years. Similar to Table 4, treatments including hand weeding resulted in significantly ($P < 0.001$) higher yields compared to their non-SHW counterparts. For the 2020 rainy season, hoe weeding alone, as well as when integrated with other herbicide treatments, showed the highest seed yield per plot; however, during the 2019 rainy season, hoe weeding alone showed the highest yield and was not statistically different from plots treated with metolachlor and pendimethalin, both at 2.0 kg a.i. ha^{-1}, and Imazethapyr + Pendimethalin, each 1.0 kg a.i. ha^{-1} + SHW at 6 WAS,

compared to other treatments that resulted in decreased seed yield, with the weedy check recording the lowest seed yield across both seasons and combined. The weedy check plots recorded the lowest 100 seed weights across all years and when the data was combined. The plots treated with hand weeding at 3 and 6 WAS recorded the highest seed weights and showed no statistical difference with plots treated with herbicide either alone or in combination with SHW at 6 WAS. The increase in seed yield and yield-related characters of cowpea achieved by the above treatments could be attributed to the efficacy of the second weeding applied to both hoe-weeded and herbicidal-treated plots, which is linked to its ability to suppress late-emerging weeds. This suppression enhances the plants' capacity to utilize available growth resources for photosynthate assimilation, ultimately increasing the production of dry matter allocated to sinks. This finding aligns with the reports of Adeyemi et al. (2019), Omovbude et al. (2020), Naeem et al. (2022), and Shittu et al. (2022), each of which documented the impact of supplementary hoe weeding on the effectiveness of pre-emergence herbicides in improving the productivity of maize, lowland rice, barley, and groundnut, respectively.

Weed characters

Table 6 reports the effects of different weed control treatments on weed cover score, weed index, and weed control index (WCI) of cowpea over two years (2019 and 2020) and the combined data. Weedy check plots consistently had the highest weed cover score and weed index and the lowest WCI across all years, indicating the most significant weed infestation. Performing hoe weeding at 3 and 6 WAS generally resulted in the lowest weed cover score and weed index, along with the highest WCI in both individual years and combined data. This suggests hoe weeding was very effective in controlling weeds. Several herbicide treatments showed promising results, particularly when combined with hoe weeding. These combinations often achieved weed control comparable to sole hoe weeding at 3 and 6 WAS. Among herbicides, a combination of Imazethapyr and Pendimethalin at 1.0 kg ha^{-1} each, or Metolachlor and Pendimethalin at 2.0 kg ha^{-1} each, were generally effective, especially when combined with hoe weeding, although they were at par with other treatments. This finding demonstrated the effectiveness of implementing additional hoe weeding at a later stage to manage late-emerging weeds and expand the range of herbicidal treatment as earlier reported by several scientists (Adeyemi *et al*., 2019; Omovbude *et al.,* 2020; Naeem *et al.,* 2022; and Shittu et al., 2022; Shittu and Lamarana, 2024).

Conclusion

This study investigated the impact of different weed control strategies on cowpea growth, yield, and weed control. The results demonstrated that weed control significantly influenced crop performance. Findings further revealed that herbicidal treatments, combined with hoe weeding, effectively control weeds, improving crop growth and yield, enhancing plant height, leaf area, light interception, and seed production. Therefore, integrated weed management involves combining pre-emergence herbicides with post-emergence hoe weeding, selecting appropriate herbicides based on weed spectrum, crop tolerance, and environmental factors, and implementing cultural practices for optimal control and increases the productivity of cowpea in the study area.

Abstract

This study investigates the effect of various packaging materia
ls on the seed viability of Groundnut (*Arachis hypogaea*), SAMNUT 24 variety. Conducted at the Department of Biological Science laboratory, Ibrahim Badamasi Babangida University, the experiment employed a complete randomized design with five packaging materials:namel; polythene bag, paper bag, cloth bag, aluminum foil, and jute bag. Each material contained 1 kg of seeds, stored for six months. Post-storage, a germination test was performed using 20 seeds from each packaging type, with parameters including germination percentage, germination index, germination rate index, and vigor index assessed after seven days. Results indicated that packaging materials significantly affected seed quality, with aluminum foil demonstrating the highest germination percentage (98.34%) and vigor index (3423.06), followed closely by polythene bags. In contrast, cloth bags yielded the lowest values for both germination percentage (67.45%) and vigor index (987.45). These findings align with existing literature suggesting that effective packaging is crucial for preserving seed viability by protecting against environmental factors. The study underscores the importance of selecting appropriate packaging materials to enhance seed quality and agricultural productivity, with aluminum foil and polythene bags as the most effective in groundnut seed storage.

Key Words: *germination index, storage, polythene , paper cloth , aluminum foil, jute bag*

Introduction

Groundnut (*Arachis hypogaea* L.) is a leguminous oil seed plant grown in semi-arid and sub-tropical regions across the globe (Hussainy et al., 2020). The peanut (*Arachis hypogaea*), also known as the groundnut is a legume crop grown mainly for its edible seeds. It is widely grown in the tropics and subtropics, important to both small and large commercial producers. It is classified as a grain legume and, due to its high oil content, an oil crop (Variath and Janila 2017). The world's annual production of shelled peanuts was 44 million tonnes in 2016, led by China, which made up 38% of the world's total production (Variath and Janila 2017)..

Kebede, (2021) reported that groundnut enhances soil fertility through nitrogen fixation, increasing crop productivity when integrated into crop rotation or cereal farming systems. The limited success of groundnut cultivation in African nations can be attributed to a combination of factors (Mwalongo, et al., 2020). These include unreliable rainfall, predominantly rain-fed farming practices, traditional small-scale farming with minimal mechanization, occurrences of pests and diseases, the use of low-yielding varieties, continued cultivation on suboptimal lands, insufficient adoption of modern agronomic techniques, lack of extension services and poor storage of Groundnut seeds which result to low germination percentage.

Several factors are responsible for declining groundnut yield in Sub-Saharan Africa (Abady et al., 2019). This includes declining soil fertility, pest, and disease incidence as well as germination failure as a result of poor-quality seeds. Enyiukwu et al. (2020) reported that germination failure in groundnuts occasioned by inappropriate storage environments and packaging materials. It is expedient to ascertain the most appropriate packaging material for the preservation of groundnut seed quality.

As a result of poor storage of Groundnut (*Arachis hypogaea* L), farmers have been faced with the problem of low germination percentage, which leads to low yield. Therefore, this study will aim to evaluate the effects of some packaging materials on seed viability of groundnut (*Arachis hypogaea* L) as this will ensure long term storage of the crop.

Materials And Method

Experimental Site

The experiment was conducted at the Laboratory of Department of Biological Science Faculty of Natural Sciences, Ibrahim Badamasi Babangida University main campus, Lapai, Niger State, Nigeria which lies between the latitude of 9.0674ON and longitude 6.5618OE.

Samples Collection

Groundnut *(Arachis hypogeae)* SAMNUT 24 variety was obtained from the Seed Center, Joseph SarwuanTarka University Makurdi, Benue State

Experimental Design

The experiment consisted of one variety of groundnut, (SAMNUT 24) and five (5) packaging materials (polythene bag, cloth bag, paper bag, Aluminium foil, paper bag and jute bag). One kilogram (1kg) of the groundnut variety was measured and kept in each of the packaging materials and stored for duration of 6 months at room temperature

Seed Viability Tests of the groundnut samples

Germination test

After storage, 20 seeds from each of the packaging materials were placed in a petri-dish with filter paper. A total of 25 petri-dishes were used. 5 petri-dishes representing each of the 5 packaging materials and were arranged in a complete randomized design (CRD) in ttriplicates. The seeds in each of the petri-dishes were watered daily and the following parameters shall be calculated:

- $G\% = \frac{\text{Total no.of seedlings emerged}}{\text{Total no.of seeds sown}}$ x 100 (Fakorade and Ojo, 1981)
- $GI = \frac{number\ of\ germinated\ seeds}{days\ of first\ count} + \cdots + \frac{\text{number of germinated seeds}}{days\ of\ final\ count}$ (AOSA, 1983)
- $GRI = \frac{\text{EI}}{\text{E\% (in decimal)}}$ (Fakorade and Ojo, 1981)

Seedling vigor index I, was calculated by multiplying the germination percentage with the mean shoot and root length after 7 days of germination.

Vigor index I = germination percentage × seedling shoot + root length in cm (Beedi et al., 2018).

Data Analysis

Data collected on all the parameters was subjected to analysis of variance (ANOVA) using the Minitab 2017 version and significant means will be separated using Fischer's Least Significant Difference (F.S.L.D) at 5% level of probability.

Results

Mean Squares from Analysis of Variance for Seed Quality of Groundnut

The mean squares from the analysis of variance for the physiological seed quality of groundnut is shown in Table 1. The table showed that packaging materials had a highly significant ($p \leq 0.01$) effect on germination percentage and germination index. On the other hand, packaging material was significant ($p \leq 0.05$) for germination rate index and vigor index.

Table 1. Mean Squares from Analysis of Variance for Seed Quality of Groundnut

SOV	DF	Germination %	Germination Index	Germination Rate Index	Vigor Index
Replication	2	234.23	12.01	651.80	11.56
Packaging Material	4	112.23**	131.92**	121.89*	123.90*
Error	4	36.34	23.46	67.10	38.12

Mean Effect of Packaging Materials on Seed Quality of Groundnut

The result of the mean effect of packaging materials on physiological seed quality of groundnuts is indicated in Table 2. The result of this table showed that seeds stored with aluminium foil recorded the highest germination percentage (98.34), although not significantly higher than those stored in polythene bag (95.97) but were significantly different from seeds stored in paper bag (76.34), cloth bag (67.45) and jute bag (79.52). Seeds stored in cloth bag recorded the lowest germination percentage. Similarly, the germination index was significantly highest in seeds stored in aluminium foil (34.45) but it was not statistically different from seeds stored in polythene bag (34.94). However, both were significantly different from the paper bag (23.78), jute bag (24.82), and cloth bag (25.52).

The lowest germination index was recorded by seeds stored in paper bag. A similar observation was recorded germination rate index where seeds stored in aluminium foil producing the highest germination rate index (401.02) and seeds stored in cloth bag producing the lowest germination rate index (267.98). The vigor index also was observed to follow a similar trend with aluminium foil and polythene bag producing significantly highest vigor index 3423.06 and 3211.90 respectively. Seeds stored in cloth bag were observed to produce the least vigor index (987.45).

Table 2. Mean Effect of Packaging Materials on Seed Quality of Groundnut

Packaging Material	Germination %	Germination Index	Germination Rate Index	Vigor Index
Polythene Bag	95.97	34.94	398.23	3211.90
Paper Bag	76.34	23.78	287.89	1000.40
Cloth Bag	67.45	25.52	267.98	987.45
Aluminum Foil	98.34	35.45	401.02	3423.06
Jute Bag	79.52	24.82	301.02	1343.22
FLSD (P<0.05)	2.12	4.56	3.67	5.12

Discussion

The results of study reveals the significant impact of packaging materials on key seed quality parameters, including germination percentage, germination index, germination rate index, and vigor index. This underscores the critical role of packaging choices in influencing the overall quality of groundnut seeds. This falls in agreement with (Tiwari *et al*., 2022; Dadlani et al., 2023) who also maintained that adequate packaging can additionally safeguard the seeds against environmental factors (temperature and relative humidity) that cause seed deterioration, thereby preserving the integrity of their quality while in storage. Notably, different packaging materials exert varying levels of influence on these parameters, emphasizing the importance of making informed decisions regarding packaging materials to optimize seed quality.

Specifically, the study demonstrates that seeds stored in aluminium foil and polythene bags exhibit the highest germination percentages, which are essential for successful crop establishment. Conversely, seeds stored in paper bags, cloth bags, and jute bags show significantly lower germination percentages. Similarly, Haque, (2014) reported that polythene bags surpassed other storage materials excluding aluminium foil, in terms of achieving superior outcomes regarding germination rates, field emergence, and vigor index. This could be attributed to the fact that polythene prevents the influence of the seed and its external environment thereby preserving its quality.

Furthermore, the vigor index, a comprehensive measure of seed quality, indicates that aluminium foil and polythene bags excel in maintaining seed vigor, while cloth bags yield the lowest vigor index. This suggests that seeds stored in aluminium foil and polythene bags are more likely to produce robust and healthy plants, reinforcing the importance of packaging materials in achieving optimal seed quality. In support of this finding, Affognon et al., (2017) reported that aluminium foil as one of the best packaging materials for viable and vigorous seeds. Similarly, Mutungi et al., (2019). Also agrees with this findings.

These results have practical implications for agricultural practices and seed storage. Farmers and seed producers can use this information to make informed decisions about the choice of packaging materials for groundnut seeds. For optimal seed quality and crop performance, aluminium foil and polythene bags are more effective options compared to paper bags, cloth bags, or jute bags.

Conclusion

The research reveals that the seed viability of groundnuts, indicated that packaging materials have a significant role as far as the seed quality of groundnuts is concerned. Aluminium foil produced the highest seed quality in terms of generation percentage, germination index, germination rate index and vigor index. On the other hand, cloth bag gave the lowest seed quality.

Green Synthesis of ZnO, CuO and ZnO-CuO Nanoparticles from Nigella sativa L. Extract and Effect of Nanoseed priming on Chickpea under Salinity Stress

Misbah Iqbal[1], Raheela Waheed[2], Roomina Mazhar[3], Safa Akhtar[4], Farah Deeba[1]*

[1]Department of Biochemistry and Biotechnology, The Women University Multan
[2]Department of Biosciences and Technology, Emerson University Multan
[3]Department of botany, Banazir bhutto women university peshwar
[4]Department of Microbiology & Molecular Genetics, The Women University Multan
Correspondence: farah.9003@wum.edu.pk

Abstract

Nigella sativa is a medicinal plant commonly referred to as "black cumin" and belongs to the family Ranunculaceae. Nanotechnology, a field that operates at the nanoscale, has numerous practical applications. Due to the unique properties of nanoparticles—including their large surface area, high reactivity, aggregation tendencies, penetration capability, small size, and distinct structure—nanotechnology has enabled a wide range of applications in agriculture. Biosynthesis offers a safe and environmentally friendly method for producing non-toxic, biodegradable nanoparticles (NPs). The objective of the present study was to synthesize ZnO, ZnO-CuO, and CuO NPs from *N. sativa* and to evaluate the impact of seed priming with these nanoparticles on the overall morphology, germination, and growth of chickpea (*Cicer arietinum*) under salt stress conditions. The synthesized NPs were characterized FTIR, XRD, DLS, SEM, and UV-Vis. For nanoseed priming, chickpea seeds were soaked in ZnO, CuO, and ZnO-CuO nanocomposite solutions at varying concentrations (100 ppm, 250 ppm, 500 ppm). The effects of ZnO, CuO, and ZnO-CuO NPs on germination, growth, and biochemical parameters of chickpea under salt stress were analyzed. Salt stress was applied in two phases. Various physiological and biochemical parameters were assessed, including catalase and peroxidase activities, hydrogen peroxide levels, seedling root and shoot lengths, fresh and dry weights, number of leaves, and lateral root development. Chickpea exhibited tolerance to salinity during the flowering stage, contributing to its stability and enhanced productivity. Following data collection, raw data were analyzed using the statistical software STAR. Nanoseed priming showed potential benefits in improving germination rates, enhancing seedling growth, and increasing stress tolerance, making it a promising approach for sustainable agriculture. The findings of this study suggest that ZnO, CuO, and ZnO-CuO seed priming can enhance chickpea growth under saline conditions. Improved seedling performance was associated with increased shoot and root lengths, fresh and dry biomass, and antioxidant enzyme activity, which collectively mitigated salt stress effects through nano-priming.

Transformation of Common Dates of Low Market Value into Crystallized Sugar by Freeze-Drying Process

Elbar Djenette[1], Rekis Abdelkrime[1], Elbar Chaima Yasmin[2]

[1]Center for Scientific and Technical Research for Arid Regions Biskra (CRSTRA) ALGERIA
[2]University Of Biskra ALGERIA
* Corresponding author: elbardjenette@gmailom

Abstract

The common dates can serve as an effective substitute for commercial white sugar, whether it is in the form of icing or crystallized sugar, and their utilization could represent a significant enhancement in terms of socio-economic benefits. The process of producing sugar from these dates begins with the cultivation of low-value date crops. The dates undergo a thorough washing process with water, effectively separating them from any grass, dirt, and other unwanted materials. Once cleaned, the dates are cut open to remove their pits. The extraction of sweet juice from the dates is achieved through a diffusion method. This technique facilitates the transfer of sugar from the date pulp into the water. Adding dates and distilled water in ratio (1/5) in a large flask to hot plate at temperature 65°C and turn slowly for 30 to 60 minutes. After this extraction phase, the sweet juice is filtered using a vacuum pump. The resulting juice contains not only the sugars derived from the dates but also various impurities that must be removed, including mineral salts and organic compounds. To achieve this purification, the filtration process employs lime milk treatment. This combination leads to the formation of insoluble salts and sediments that help stabilize and eliminate the impurities present in the juice. After this treatment, the mixture is passed through filters designed to capture the impurities while allowing the pure sweet juice to flow through. At this stage of processing, the filtered juice is composed of approximately 20% sugar and 80% water.
Using a rotavape, the juice is concentrated at 40°C until it becomes a syrup containing 65% to 70% sucrose, the syrup is then frozen, then sublimated, and finally desorption (lyophilization) by freeze-drying transforms it into crystallized sugar, ready for various applications.

Honeybee Preferences for Pollen Substitute Diets: A Climatic Perspective

Mustafa Güneşdoğdu*, İsmail Yaşhan Buluş[1]

[1]Department of Animal Science and Technologies, Faculty of Applied Sciences, Muş Alparslan University, Muş, Türkiye

Abstract

Honey bees (*Apis mellifera* L.) are the best known and most effective pollinating insects. Not enough information is available on the nutrition of these insects. Various products are used as protein sources for the diet of bees, and these products are usually given to the colony in the form of cake. There is little research on dry protein substitutes used for feeding bees outside the colony. In this study, the preference of bees for different dry protein substitutes was investigated in continental and subtropical climates. The results show that the seven different formulations are most preferred by the bees. In the subtropical climate, the bees showed no interest in these feeds, while in the continental climate they showed considerable interest. In addition, bees visited dark-colored baits more. In addition, baits close to the colonies were preferred more.

Key Words: *Apis, Dry, Feeding, Foraging, Substitute*

Introduction

Pollinators are an important species for the sustainability of flowering plants. Among these species, honeybees (*Apis mellifera* L.) are the most widespread and economically important species for humans (Güneşdoğdu et al., 2023). This species needs nutrients to survive and reproduce. These nutrients are carbohydrates, amino acids, lipids, vitamins, minerals, and water (Huang, 2012). Bees meet their carbohydrate requirements from nectar and honey. When these sources are scarce in nature, beekeepers add sugar syrup. Pollen provides the bees with amino acids, vitamins, minerals, and fats. When pollen is not available in nature, beekeepers use pollen diets or pollen substitutes. There are only a limited number of protein feeds for bees worldwide. These products are not yet sold in most countries (Güneşdoğdu et al., 2024).

The development of pollen substitutes for honeybees has long been of interest to the beekeeping industry. The development of such products makes it possible to feed the bees with protein feed and increase their productivity. Especially from fall to early spring, when there are no natural pollen sources in the environment, these substitutes induce the start of brood production in the colonies and the production of healthy offspring (Zahra and Talal, 2008). For honey production, it is important to start the nectar flow with strong colonies.

It is important to provide protein feed, promote the strengthening of bee colonies, maximize pollination, and protect them from pesticides, parasites, and diseases. Efficient forage production for animals, including insects, depends on palatability, health, and cost (Wilson et al., 2005). However, even a balanced diet that contains all nutrients is only important if it is consumed by the animal. It depends on whether it is consumed by the animals (Forbes, 1995). For bees, the fat and protein content in pollen is important for attractiveness (Ghosh et al., 2020).

Supplying powdered pollen substitutes to honey bee colonies is a simple method and requires minimal time and labor if weather conditions allow bees to leave the hives in search of food (Saffari et al., 2010).

Materials and Methods

Study Locations and Colony Information

This study was conducted in Muş/Turkey (38°46'19"N 41°25'47"E) and Tarsus/Mersin/Turkey (36°57'10"N 34°51'20"E) in the fall and in Kulp/Diyarbakır/Turkey (38°28'30"N 41°02'42"E) and Tarsus/Mersin/Turkey (36°57'10"N 34°51'20"E) in February and March (Figure 1). The elevation of these locations was 1290 mt, 110 mt, and 802 mt above sea level, respectively. There was a total of 105 honey bee colonies in the apiary. The colonies consisted of 3-8 bee covered frames.

Figure 1. Locations where the study was conducted in Turkey.

Raw materials and formulations

The raw materials listed in Table 1 were used to produce the dry pollen substitutes. The raw materials used are in powder or flour form. The quantities listed in Table 2 were used to produce the feeds. Many feed types were formulated, but the seven feed types that were most popular with the bees were indicated.

Table 1. Products used and their nutritional value (g/100g)

Raw Materials	Calories (kcal)	Protein	Carbohydrate	Fat
Ground Rice Flour	365.00	6.00	80.00	1.40

Wheat Starch	177.00	0.17	87.00	0.14

Results and Discussion

Numerous diet compositions were tested. Table 2 shows seven diet compositions that were of great interest to the bees. The results are from three different locations. In Mersin, the bees showed no interest in any forage composition. This could be due to the year-round agricultural activity and natural pollen sources in this region. At the other two sites, the bees were interested in a range of forage compositions (Figure 2). This is thought to be due to the continental climate in these regions and the lack of natural pollen sources at the beginning of the fall season. When bees are offered such diets, it is not known which ones they will choose. Saffari et al. (2010) reported that among three different commercial dry pollen substitutes (Feedbee®, Bee-Pro®, and TLS Bee Feed), Feedbee® was the most attractive. The protein, fat and carbohydrate contents of this product were 36.4%, 3.9%, and 51.8%, respectively. Gregory (2006) and De Jong et al. (2009) reported that these diets increased the protein level in the hemolymph. Furthermore, Gregory (2006) reported that pollen was the most effective in terms of lifespan and colony strength, followed by Feedbee®, Bee-Pro® products.

Recommendations for the use of dry diets;

- The feeding sites should be in the immediate vicinity of the colonies,
- It should be in a shady place without direct sunlight,
- It must be protected from the wind,
- Yellow and darker colored flours should be preferred,
- White flour is rarely preferred,
- It should have good moisture and oil content,
- Pollen sources must be scarce in nature,
- The bees need time to get used to it, there should be no rush.

Table 2. Diets and their proportions (g/100g)

Raw Materials	Diet 1	Diet 2	Diet 3	Diet 4	Diet 5	Diet 6	Diet 7
Ground Rice Flour	20	-	-	-	-	-	15
Corn Flour	20	-	-	-	-	10	-

Figure 2. Different diets and forager bees' density

Conclusion

Honey bees have an important place in people's lives, even if many people are not aware of this. Measures must be taken to reduce the negative impact on these insects. We need to control pests and ensure the quality of food for bees. There is very little research on substitutes for dry pollen. There is a need for numerous studies like our study.

Possibilities of Using Microalgea Varieties in Beekeeping Research

Mustafa Güneşdoğdu*, İsmail Yaşhan Buluş[1]

[1]Department of Animal Science and Technologies, Faculty of Applied Sciences, Muş Alparslan University, Muş, Türkiye

Abstract

In medicine, microalgae are used to produce food supplements and medicines. In particular, algae such as spirulina and chlorella with their high content of proteins, vitamins, minerals and omega-3 fatty acids have positive effects on health. In addition, some types of microalgae have antimicrobial and antiviral properties and are being studied in the treatment of cancer and cardiovascular diseases. In animal husbandry, microalgae are used as a feed additive to improve animal nutrition. Microalgae can accelerate the growth of animals, strengthen their immune system and reduce environmental pollution. In particular, algae used in feed for ruminants can reduce methane emissions. In beekeeping, microalgae are used as food supplements for bees. Food supplements with microalgae can strengthen the bees' immune system and increase their survival rate in winter. In addition, microalgae can promote the production of compounds that increase propolis production. In summary, microalgae offer important health, productivity and environmental benefits in areas such as medicine, animal husbandry and beekeeping. Research in this field continues to provide solutions to support the sustainable and efficient use of microalgae.

Key Words: *Microalgea, Eco-frendly beekeeping, Study, Bee health, Sustainable*

Introduction

Algae comprise about 25,000-50,000 species of different sizes, shapes, pigments and functional compounds (Guiry, 2018). They are generally divided into prokaryotic unicellular cyanobacterial microalgae (blue-green algae) and eukaryotic unicellularand multicellular algae (green algae, red algae and brown algae) (Yaakob et al., 2014; Pereira, 2021; Ullmann and Grimm, 2021). Algae species have been known for centuries and are used in almost all areas of industry. Especially in the countries of the Far East and South Asia, algae species, which are widely used as food, in the medical, pharmaceutical and cosmetic industries and in the production of fertilizers in agriculture, are not only collected in their natural habitats, but also cultivated in the oceans and grown like plants on land (Atay, 1984). They are classified according to the ecosystem in which they occur, their size, their pigments and whether they are prokaryotic or eukaryotic. Algae that do not have true roots, stems and leaves are divided into microalgae and macroalgae according to their size.

Macroalgae are plant organisms that are between 1-2 cm and 40-50 m in size, depending on the species, and provide aquatic organisms with food, protection and reproduction. Macroalgae species have been used in the past as food, fertilizer, animal feed, dye, thickener, soap, glass raw material, gelling agent and to produce biofuels (Jensen, 1966). Microalgae are heterogeneous microorganisms that do not belong to a specific taxonomic group. They can be unicellular, colonial or filamentous. From an ecological point of view, they form a community of unicellular algae belonging to different large groups. Microalgae are widely distributed in freshwater, brackish, and marine ecosystems, although certain species are also capable of thriving in terrestrial environments such as rocks and soils. These microorganisms are the focus of research in botany, phycology, and microbiology. Cyanobacteria, which possess a prokaryotic structure, are not only studied within the fields of botany and phycology but also extensively researched in microbiology. From an ecological perspective, cyanobacteria, unicellular green and red algae, euglenoids (*Euglenophyta*), chrysophytes (*Chrysophyta*), and dinoflagellates (*Dinoflagellata*) collectively constitute the group of microalgae.

As photosynthetic organisms, microalgae play a crucial role in sustaining life on Earth. They contribute significantly to atmospheric oxygen production while simultaneously utilizing carbon dioxide for photoautotrophic growth. Their exceptional biodiversity enables them to inhabit diverse regions across the biosphere. Furthermore, microalgae exhibit remarkable resilience to environmental stressors, allowing them to withstand conditions such as temperature fluctuations, drought, salinity, photo-oxidative stress, anaerobic environments, osmotic pressure, and UV radiation (Minhas et al., 2016).

Numerous algal species have the ability to synthesize bioactive compounds with allelopathic properties. Allelopathy refers to a biological phenomenon in which an organism releases specific biochemical substances that influence the germination, growth, survival, and reproduction of other organisms within its environment. These compounds, classified as allelochemicals, belong to the category of secondary metabolites and can exert either beneficial (positive allelopathy) or detrimental (negative allelopathy) effects on target organisms and ecosystems. The allelopathic potential of microalgae has been explored as a biological strategy for controlling algal blooms and mitigating microbial contamination caused by bacteria, fungi, and protozoa.

Microalgae are also recognized for their ability to produce a wide range of biologically active compounds (BACs) with applications in biotechnology and clinical research. The emergence of antibiotic resistance among bacteria and other microorganisms poses a significant threat to both human and animal health. In this context, microalgae are considered promising candidates for the discovery of novel antibacterial agents that may circumvent resistance mechanisms. Notably, large-scale cultivation of microalgae in photobioreactors can be conducted under controlled conditions, facilitating the production of high or even ultra-high-density cultures (Richmond, 2004; Gordon and Polle, 2007; Sun et al., 2019; Wang et al., 2019; Jin et al., 2020).
This mini-review presents findings related to the utilization of selected microalgae species in various ecosystems and explores their potential applications in beekeeping. Additionally, the discussion addresses their contributions to sustainability and environmental conservation.

Sustainability and environmental benefits: Use of microalgae in beekeeping and impact on the environment
In recent years, microalgae have attracted attention as an important alternative in agriculture and animal husbandry due to their rapid biomass production potential, low environmental footprint and sustainable production methods. Considering the limitations and environmental impact of conventional feeds, microalgae represent a nutritionally and environmentally beneficial option for beekeeping.

Ecological advantages of microalgae production
Microalgae can produce large amounts of biomass through photosynthesis and contribute to the fight against climate change by absorbing carbon dioxide (CO_2) from the atmosphere during this process (Chisti, 2007). In contrast to traditional agricultural practices, the cultivation of microalgae does not cause any expansion of agricultural land or the loss of habitat (Wijffels et al., 2010). In addition, the use of saltwater or recycled wastewater instead of freshwater for microalgae cultivation enables efficient use of water resources (Pittman et al., 2011). This characteristic makes microalgae an attractive alternative in areas with water scarcity.

Sustainability of the use of microalgae in bee nutrition
Sugar syrup and pollen substitute commonly used in beekeeping may not be sufficient in terms of nutritional value and environmental sustainability. Microalgae can contribute to bee nutrition with their high content of proteins, essential amino acids, omega-3 fatty acids and antioxidants (Becker, 2007). These nutrients can boost bee immunity, improve colony health and reduce losses. In addition, the use of microalgae-based feeds can reduce the environmental impact of beekeeping. The production of sugar syrup usually requires large agricultural areas and large amounts of water. The use of microalgae-based feeds offers an environmentally friendly approach by ensuring a more efficient consumption of these resources (Barsanti and Gualtieri, 2014).

Prospects
For microalgae to be widely used in beekeeping, it is of great importance to reduce production costs and develop scalable production techniques. In addition, the long-term effects of microalgae-based feed on bees should be studied in more detail. Scientific studies in this area can accelerate the acceptance of microalgae as a sustainable option for beekeeping. Therefore, microalgae have significant potential as a sustainable feed source that minimizes environmental impact and improves bee health. Research on this topic can make a valuable contribution to both beekeeping and ecosystem conservation.

Effects and use as food
Although honeybee colony losses are thought to be due to a combination of stress factors, research shows that malnutrition is one of the main causes of these losses. Commercial beekeepers are increasingly turning to artificial pollen substitutes to support their colonies in times of food shortages and to increase bee populations prior to pollination. Nevertheless, these artificial diets are known to lack essential macronutrients, including proteins, lipids, prebiotic fibers, as well as vital micronutrients such as vitamins, minerals, and antioxidants. Consequently, enhancing the nutritional profile of pollen substitutes has become a crucial aspect of contemporary beekeeping practices. Microalgae offer considerable potential for plant nutrition as their biochemical composition is similar to that of natural pollen. Although there are few studies on honeybees, microalgae have been extensively studied in insect nutrition (Qiu et al., 2019), aquaculture (Guedes et al., 2015), animal husbandry (Madeira et al., 2017) and human nutrition (Caporgno & Mathys, 2018). The nutritional content of microalgae has been extensively characterized, and it has been shown that they can be evaluated both as a sole source of protein and as a feed additive for various organisms (Guedes et al., 2015; Madeira et al., 2017). Microalgae are rich sources of carotenoid pigments, particularly lutein, zeaxanthin, and astaxanthin, which have been shown to improve survival rates in various organisms when incorporated into their diet (Merchie et al., 1998; Babin et al., 2010). The most promising microalgae species in terms of beekeeping are Arthrospira and Chlorella. Arthrospira (known as Spirulina) consists of 60-70% of its dry weight in protein and is a highly bioavailable protein source. About half of the proteins contain essential amino acids (EAA) (Soni et al., 2017). Similarly, chlorella species have a protein

content of 50-60% and offer a complete EAA profile (Kotrbáček et al., 2015). Arginine, histidine, isoleucine, leucine, lysine, methionine, phenylalanine, threonine, tryptophan and valine are among the essential amino acids required by honeybees, and these amino acids must be obtained from the diet. When worker bees consume pollen, these amino acids are incorporated into the vitellogenin lipoprotein in the fat body and form the precursor of the proteins of the hypopharyngeal glands that are secreted to feed the larvae (Crailsheim, 1990). A recent study has shown that Chlorella sorokiniana has positive effects on the growth and individual nutritional physiology of honey bee colonies. According to the results of the study, bees fed with this microalga showed an increase in fat body protein content, vitellogenin mRNA levels and hypopharyngeal gland size. These results suggest that chlorella is promising as a pollen substitute or dietary supplement (Jehlík et al., 2019).

In another study, a pollen substitute formulation containing Arthrospira was found to increase the performance of bee colonies compared to unfed control colonies (Kumar et al., 2013). However, the exact effects of Arthrospira on the health of individual bees and colony dynamics are not yet fully known. Two essential polyunsaturated fatty acids (PUFAs) that are important for honeybees are linoleic acid and α-linolenic acid (Arien et al., 2015). Studies have shown that dietary PUFA content is related to vitellogenin expression in the fat body (Wegener et al., 2018). 10-20% of the dry weight of Chlorella sorokiniana consists of lipids and studies have shown that this microalga increases fat storage in bees (Jehlík et al., 2019). However, species such as Botryococcus (25-75%), Nanochloropsis (31-68%) and Schizochytrium (50-77%) are known to have a much higher lipid content (Demirbaş and Demirbaş, 2011). Microalgae also contain valuable sources of vitamins such as tocopherols, ascorbic acid and B vitamins, as well as essential minerals such as sodium, potassium, calcium and magnesium (Fábregas and Herrero, 1990). Studies have shown that in worker bees fed with Chlorella vulgaris and Arthrospira platensis, growth rates increase, antioxidant defenses are strengthened, and the expression of heat shock proteins increases (Ricigliano et al., 2022). A significant increase in vitellogenin mRNA expression levels was observed in bees fed spirulina (Ricigliano et al., 2021). In addition, hypopharyngeal gland development, an increase in amino acid content and an increase in vitellogenin mRNA levels were observed in bees whose diet was supplemented with 0.5-10% Chlorella sorokiniana (Jang et al., 2022). In another study, it was reported that bee colonies fed with feed containing 25% spirulina produced more brood compared to the control group (McMenamin et al., 2023). Similarly, the positive effects of feeds containing chlorella (2%) on worker bees and colony health are highlighted (Jang et al., 2023). In addition, spirulina (2 g) was found to have positive effects on vitellogenin expression, abdominal lipid ratio and hypopharyngeal gland development (Güneşdoğdu et al., 2024). Experimental hives fed with Spirulina platensis, Scenedesmus quadricauda, Scenedesmus apiculatus, and Oocystis borgei Snow showed a 2.7% increase in hygienic behavior compared to control hives fed with honey and powdered sugar (Toderas et al., 2017). These results suggest that microalgae can be considered an important food source for honeybees and have the potential to be used as a pollen substitute or food supplement.

Table 1. Nutritional Content and Potential Benefits of Microalgae for Honey Bees

Microalgae	Nutritional Content and Benefits	References
Spirulina platensis	60-70% protein, high bioavailability amino acids, Vitamin and mineral source, Increases bee development and nutritional value, Increases vitellogenin level.	Soni et al., (2017) Becker (2007) Kumar et al., (2013) Güneşdoğdu et al., (2024)
Chlorella spp.	50-60% protein, full essential amino acid profile, High chlorophyll and antioxidant content.	Kotrbáček et al., (2015) Fábregas ve Herrero (1990)
Chlorella sorokiniana	Increases vitellogenin level.	Jehlík et al., (2019)
Chlorella vulgaris	It strengthens bee immunity and increases vitellogenin level.	Ricigliano et al., (2022)
Dunaliella salina	It is rich in beta-carotene.	Caporgno and Mathys (2018)

Antibacterial effect

The antimicrobial properties of microalgae have been associated with various bioactive compounds spanning multiple chemical classes, such as indoles, terpenes, acetogenins, phenols, fatty acids, and volatile halogenated hydrocarbons (Mayer and Hamann, 2005; Cardozo et al., 2007). For instance, the antimicrobial potential of supercritical extracts derived from the microalga *Chaetoceros muelleri* has been attributed to its lipid composition (Mendiola et al., 2007). Similarly, the antimicrobial effects observed in different pressurized extracts of *Dunaliella salina* are not solely linked to fatty acids but are also influenced by other bioactive compounds, including α- and β-ionone, β-cyclocitral, neophytadiene, and phytol (Herrero et al., 2006). As antibacterial agents, microalgae can prevent the occurrence of bacterial diseases. It has been shown that algae-derived long-chain polyunsaturated fatty acids (LC-PUFAs) and algal sterols, such as eicosapentaenoic acid (EPA), have antibacterial properties and can be effective against both Gram-positive and Gram-negative bacteria (Benkendorff et al., 2005; Desbois et al., 2009). A microalgae homogenate obtained from Tetraselmis suecica showed good in vitro antibacterial activity

against various Vibrio species, including important shrimp pathogens such as Vibrio alginolyticus, Vibrio anguillarum, Vibrio parahaemolyticus and Vibrio vulnificus (Austin and Day, 1990). Honeybees infected with *Nosema ceranae* and provided with extracts from *Porphyridium marinum* and *Porphyridium purpureum* exhibited a reduced parasite load compared to the control group. Experimental bees experienced up to a 30% decrease in *Nosema* infection levels relative to untreated controls, and the parasite burden was approximately half that observed in fumagillin-treated individuals (Roussel et al., 2015). Additionally, extracts of *Chlorella sorokiniana* demonstrated antimicrobial activity against plate cultures of *Paenibacillus larvae* (Vránová, 2017), while similar inhibitory effects were noted when *Chlorella vulgaris* extracts were applied to spores and vegetative cultures of *Paenibacillus larvae* (Dostálková et al., 2021).

Microalgae cultures of Chlorella minutissima, Tetraselmis chui, Nannochloropsis species, Arthrospira platensis, and Isochrysis species have been shown to inhibit the growth of bacteria (Vibrio parahaemolyticus, V. anguillarum, V. splendidus, V. scophthalmi, V. alginolyticus, and V. lentus) (Kokou et al., 2012). The first antibacterial compound isolated in history (chlorellin) is believed to have been obtained from the microalgae Chlorella, which showed inhibitory activity against Gram-positive and Gram-negative bacteria (Pratt et al., 1944).

Some microalgae species exhibit antimicrobial activity via various mechanisms. For instance, *Fischerella ambigua*, a cyanobacterium isolated from a soil sample, produces parsiguine, a bioactive compound with antibacterial and antifungal properties (Ghasemi et al., 2004). Parsiguine exhibits antimicrobial activity against *Staphylococcus epidermidis* PTCC 1114 and *Candida krusei* ATCC 44507. Additionally, the marine diatom *Phaeodactylum tricornutum* has been found to contain antibacterial compounds effective against various bacterial species (Desbois et al., 2009). The primary bioactive molecule identified in this microalga is eicosapentaenoic acid (EPA), which has demonstrated potent activity against multidrug-resistant *Staphylococcus aureus* (MRSA) strains 16a and 252, along with other *S. aureus* strains, *Staphylococcus epidermidis*, *Bacillus weihenstephanensis*, and *Bacillus cereus*. Furthermore, EPA has been reported to be effective against *Vibrio (Listonella) anguillarum*, a pathogen responsible for hemorrhagic septicemia in fish, as well as *Micrococcus luteus*, *Photobacterium* species, and *Planococcus citreus*. Notably, eicosapentaenoic acid has also been described as toxic to herbivorous organisms (Jüttner, 2001). Another bioactive compound isolated from *P. tricornutum*, hexadecatrienoic acid, has shown antibacterial effects against *S. aureus* (Amaro et al., 2011). On the other hand, ethanol extracts from the red stage of Haematococcus pluvialis were found to have antimicrobial activity against Escherichia coli and S. aureus. This effect is most likely due to the presence of the short-chain fatty acids butanoic acid and methyl lactic acid (Santoyo et al., 2009). Polyunsaturated aldehydes are of particular importance among the bioactive compounds of algal origin. These compounds are synthesized by diatoms and have been found in species such as Skeletonema marinoi (formerly Skeletonema costatum) (Vidoudez et al., 2008; Sarno et al., 2005), Pseudonitzschia delicatissima and Thalassiosira rotula (Miralto et al., 1999). Decadienal, one of the most important compounds in this group, shows strong antibacterial activity against important human pathogens such as methicillin-resistant strains of Staphylococcus aureus (MRSA) and Haemophilus influenzae as well as bacteria such as Escherichia coli, Pseudomonas aeruginosa, Staphylococcus aureus and Staphylococcus epidermidis. It is thought that decadienal is probably derived from arachidonic acid. This compound has also been reported to inhibit the growth of various Gram-negative bacteria, including *Aeromonas hydrophila*, *Vibrio anguillarum*, *Alteromonas haloplanktis*, *Photobacterium phosphoreum*, and *Psychrobacter immobilis*, as well as Gram-positive species such as *Planococcus citreus* and *Micrococcus luteus* (Smith et al., 2010). Furthermore, extracellular metabolites secreted by *Skeletonema costatum* during its mid-growth phase have demonstrated antibacterial activity against *Listeria monocytogenes* (Terekhova et al., 2009). Organic extracts from *S. costatum* have also exhibited inhibitory effects on several *Vibrio* species (Naviner et al., 1999), specifically suppressing the growth of *Vibrio mytili* T, *Vibrio* sp. S322 (a pathogen affecting Japanese oyster larvae), *Vibrio* sp. VRP (a pathogen of mussel larvae), and *Vibrio anguillarum*.

Additionally, strains of *Chroococcus dispersus*, *Chlorella vulgaris*, and *Chlamydomonas reinhardtii* have shown considerable antibacterial effects against *Staphylococcus aureus*, *Staphylococcus epidermidis*, *Bacillus subtilis*, *Escherichia coli*, and *Salmonella typhi* (Ghasemi et al., 2007). In the same study, *C. dispersus* strains were also found to inhibit the growth of *Pseudomonas aeruginosa*. Moreover, organic extracts obtained from *Euglena viridis* have demonstrated inhibitory effects on a range of bacterial species, including *Pseudomonas aeruginosa*, *Pseudomonas putida*, *Pseudomonas fluorescens*, *Aeromonas hydrophila*, *Edwardsiella tarda*, *Vibrio alginolyticus*, *Vibrio anguillarum*, *Vibrio fluvialis*, *Vibrio parahaemolyticus*, *Vibrio harveyi*, and *Escherichia coli* (Das et al., 2005).

Antiviral effect

Several viral diseases have emerged or re-emerged in recent years. Although there are some antiviral drugs specifically designed to combat these diseases, the constant emergence of drug-resistant mutations in viruses is a major problem. Therefore, microalgae are of great interest as potential sources of antiviral compounds (Borowitzka, 1995). According to Amaro et al. (2011), the viral infection process is divided into three phases: Initial phase: adsorption of the virus to the host cell and invasion of the cell; Mid-phase: the phase in which the

cell is forced to synthesize numerous copies of the virus; Final phase: the maturation of the new virus particles and their release from the cell. The effect of the antiviral drug acyclovir on the herpes simplex virus (HSV), for example, is observed in mid-phase of the viral infection (Elion et al., 1977). In contrast, antiviral factors derived from Dunaliella species neutralize the function of the virus in initial phase (Ohta et al., 1998). *Dunaliella primolecta* extract was found to have the highest antiviral activity against *HSV-1*. Three of these antiviral compounds were purified by chromatographic methods and NMR and MS analyzes showed that these compounds are phophorbide-like structures.

Sulfated polysaccharides from the cell wall of the red microalgae Porphyridium sp. have shown strong antiviral activity against the herpes simplex virus type 1 and 2 (HSV-1, HSV-2) and the varicella zoster virus (VZV) (Huleihel et al., 2001). These sulfated polysaccharides also inhibit the replication of two economically important viruses, viral hemorrhagic septicemia virus of salmonids (VHSV) and African swine fever virus (ASFV) (Fabregas et al., 1999). On the other hand, *allophycocyanin* extracted from *Spirulina platensis* has been observed to mitigate the cytopathic effects in cells infected with *enterovirus 71*. This viral infection poses a significant health risk, particularly in children, as it is associated with high morbidity and mortality rates. The discovery of the antiviral activity of *allophycocyanin* represents a noteworthy advancement in this field. Its mechanism of action has been linked to delaying viral RNA synthesis within infected cells while simultaneously reducing apoptosis in *enterovirus 71*-infected rhabdomyosarcoma cells (Shih et al., 2003).

Several polysaccharides derived from marine algae have also demonstrated substantial antiviral properties (Ahmadi et al., 2015). Among these is *naviculan*, a sulfated polysaccharide isolated from the diatom *Navicula directa* (Lee et al., 2006). Research findings indicate that *naviculan* exhibits strong antiviral effects against *HSV-1* and *HSV-2* (IC_{50}: 7–14 µg/mL) and plays a crucial role in inhibiting the early replication stages of the influenza virus. Notably, *naviculan* has also shown inhibitory activity against *HIV* by interfering with viral attachment and penetration processes. Additionally, it has been reported to prevent the fusion of *CD4*-expressing cells with *HeLa* cells expressing the *HIV* glycoprotein gp160.

Moreover, *p-KG03*, a sulfated exopolysaccharide extracted from *Gyrodinium impudicum*, has displayed significant antiviral activity against *encephalomyocarditis virus (EMCV)* in vitro (EC_{50} = 26.9 µg/mL) (Yim et al., 2004). Similarly, *Cochlodinium polykrikoides* produces polysaccharides (A1 and A2) capable of inhibiting the cytopathic effects of *influenza virus types A and B*, *respiratory syncytial virus types A and B*, and *HIV-1* (Hasui et al., 1995). In another study, *calcium spirulan* extracted from *Arthrospira platensis* demonstrated selective inhibition against multiple viruses, including *HSV-1* (in *HeLa* cells), *HCMV* (in *HEL* cells), *influenza A* (in *MDCK* cells), *Coxsackie virus* (in *Vero* cells), *measles* (in *Vero* cells), *HIV-1* (in *MT-4* cells), *poliovirus* (in *Vero* cells), and *mumps virus* (in *Vero* cells) (Hayashi et al., 1996).

Porphyridium purpureum		

Table 3. Antiviral Effects of Microalgae on Various Bacteria

Microalgae	Viruses It Affects	References
Dunaliella primolecta	*Herpes simplex virus (HSV-1)*	Ohta et al. (1998)
Porphyridium sp.	*Herpes simplex virus (HSV-1, HSV-2), Varicella zoster virus (VZV), VHSV,* and *ASFV*	Huleihel et al. (2001); Fabregas et al. (1999)
Spirulina platensis	*Enterovirus 71*	Shih et al. (2003)
Navicula directa	*HSV-1, HSV-2, Influenza virus,* and *HIV*	Lee et al. (2006)
Gyrodinium impudicum	*Encephalomyocarditis virus (EMCV)*	Yim et al. (2004)
Cochlodinium polykrikoides	*Influenza A/B, Respiratory syncytial virus (RSV),* and *HIV-1*	Hasui et al. (1995)
Arthrospira platensis	*HSV-1, HCMV, Influenza A, Coxsackie, HIV-1, Polio, Measles,* and *Mumps*	Hayashi et al. (1996)
Nostoc flagelliforme	*HSV-1, HSV-2, Human cytomegalovirus,* and *Influenza A*	Kanekiyo et al. (2007)

Furthermore, *nostoflan*, an acidic polysaccharide produced by *Nostoc flagelliforme*, has been identified as an inhibitor of *HSV-1*, *HSV-2*, *human cytomegalovirus*, and *influenza A virus* (Kanekiyo et al., 2007). Studies suggest that its antiviral effect against *HSV* stems from its ability to block viral attachment to host cells.
Despite the significant advancements in this field, various challenges remain. Nevertheless, ongoing research continues to introduce promising new strategies for the sustainable treatment of viral infections, expanding the potential avenues for future scientific progress.

Antifungal effect

Fungal infections are known for their long-term persistence and pathogenic yeasts are a common source of transmission between humans and animals. Infections with Candida spp. are among the most resistant strains, especially in women, and can lead to infertility (Pellati et al., 2008), arthritis (Yordanov et al., 2004) and various organ damage if left untreated. Immunocompromised individuals are more susceptible to fungal diseases caused by yeast and mold spores. Parsiguine, a compound isolated from Fischerella ambigua, and known for its antibacterial properties, has been shown to be effective against the yeast Candida krusei ATCC 44507, and is considered an important antifungal agent (Ghasemi et al., 2004).
In recent studies, ten different strains of microalgae isolated from freshwater sources in Turkey were found to have antifungal activity against the yeast species Saccharomyces cerevisiae, Candida albicans and Candida tropicalis. Among these species, Oscillatoria sp. and Chlorococcus sp. stand out as microalgae with the strongest antifungal activity (Katircioglu et al., 2006). In addition, ethanol extracts of Haematococcus pluvialis were tested on Candida albicans and Aspergillus niger; all extracts were found to be effective against C. albicans but showed no inhibition against A. niger (Santoyo et al., 2009). The compounds responsible for this antifungal activity were butanoic acid and methyl lactate, which were previously known for their antimicrobial properties (Cherrington et al., 1991). In addition, Chlamydomonas reinhardtii, which has a broad spectrum of biological activities, exhibits both antibacterial and antifungal effects. In one study, this microalgae species was found to inhibit the growth of Candida kefyr, Aspergillus niger, and Aspergillus fumigatus (Ghasemi et al., 2007).
In addition, the antifungal effect of the extracts of Scenedesmus obliquus was investigated and in particular the diethyl ether extracts were tested against Aspergillus flavus, Aspergillus steinii, Aspergillus ochraceus, Aspergillus parasiticus, It was found to be effective against fungal species such as Aspergillus westerdijikia, Aspergillus carbonarius, Fusarium verticillioides, Fusarium proliferatum and Penicillium verrucosum (Marres et al., 2019). However, aqueous, methanol, ethanol, acetone and chloroform extract only showed antifungal activity in some fungal species. For example, the aqueous extract proved to be effective against A. flavus, A. steinii, A. westerdijikia and A. carbonarius. Caratungiols A and B isolated from the marine dinoflagellate Amphidinium sp. belong to the class of polyols and studies have shown that caratungiol A at a concentration of 12 µg/disk exhibits antifungal activity on Aspergillus niger (Washida et al., 2006).
According to Abedin and Taha (2008), ethanol, acetone, diethyl ether, and methanol extracts of S. quadricauda exhibited antifungal properties against fungal species such as A. niger, A. flavus, P. herquei, and F. moniliforme. Similarly, Vehapi et al. (2018) found that extracts of Chlorella vulgaris and Chlorella minutissima showed strong antifungal activity against A. niger and Fusarium oxysporum when cultured in iroko tree sap. The study showed that the antifungal activity of these algae species varied when cultured in different media, with lower activity in BBM media and wastewater from Istanbul. In a study conducted by Ghasemi et al. (2007), the antifungal activity of the supernatants of 15 different algae strains was investigated and it was reported that Chlamydomonas reinhardtii, Chlorella dispersus, Chlorella vulgaris, Chlorella sp., Anacystis nidulans, Chlorella ellipsoidea, and Oocystis sp. showed moderate antifungal activity against fungi such as Candida kefyr, Aspergillus fumigatus, and A. niger. However, only the strain C. dispersus 039 proved to be effective against C. albicans, while the other algae extracts showed no activity against C. albicans. These results show that the antifungal activity of microalgae species can be optimized not only with growth media and cultivation techniques, but also with modern molecular biotechnological methods that allow the manipulation of intracellular and extracellular target metabolites.

Table 4. Antifungal Effects of Microalgae on Various Bacteria

Microalgae	Types of Fungi It Affects	References

Table 5. Antiprotozoal Effects of Microalgae on Various Bacteria

Microalgea	Protozoa It Affects	References
Amphidinium sp.	*Tritrichomonas foetus*	Washida et al. (2006)
Calothrix sp.	*Plasmodium falciparum*	Rickards et al. (1999)
Fischerella ambigua	*Plasmodium falciparum* and *Trypanosoma rhodesiense*	Perez et al. (1990)
Microcystis aeruginosa	*Plasmodium falciparum* and *Trypanosoma brucei rhodesiense*	Portmann et al. (2008b)
Nostoc sp.	*Plasmodium falciparum*	Barbaras et al. (2008)

Antiprotozoal effect

Protozoal infections are serious health problems that often affect people living in tropical regions. The people most affected by these diseases often live in the poorest parts of the world. Protozoa are single-celled organisms that, like their host cells, are eukaryotic in structure. This makes it difficult to develop effective drugs against protozoa, which have a low risk of toxicity due to their similar cell structure to their host cells. In addition, drug resistance of protozoa is an important issue that needs to be considered. Algae are an inexhaustible source of biologically active compounds (BACs) thanks to their unique physiological properties. For this reason, many researchers worldwide are focusing on the antiprotozoal potential of algae. Most of these studies focus on macroalgae species (Torres et al., 2014). For example, the marine dinoflagellate Amphidinium sp. also exhibits antiprotozoal properties. Caratungiol A from this alga was found to be effective against Tritrichomonas fetus at a concentration of 1 µg/ml (Washida et al., 2006). Another important species, Calothrix sp., synthesizes indole-[3,2-j] phenanthridine compounds called calothrixin A and B, which show antiplasmodial activity against Plasmodium falciparum FAF6 (Rickards et al., 1999). However, Ambigol C, a natural compound isolated from Fischerella ambigua, showed moderate antiprotozoal activity against P. falciparum clone KI (IC50 = 1.5 µg/mL) and NF54 (IC50 = 2.4 µg/mL) strains (Perez et al., 1990). It has also been reported to be moderately effective against Trypanosoma rhodesiense (Wright et al., 2005). Aeracylamides A and B (Portmann et al., 2008a) and compounds C and D were isolated from M. aeruginosa strain PCC 7806 (Portmann et al., 2008b). Of these compounds, aeracylamide B exhibited submicromolar IC50 values against P. falciparum, while aeracylamide C showed low micromolar activity against T. brucei rhodesiense (Portmann et al., 2008b). The β-carboline indole alkaloid nostocarboline, obtained from Nostoc sp. 78-12A, showed significant activity against the P. falciparum K1 strain (Barbaras et al., 2008). This compound showed growth inhibitory properties at nanomolar concentrations against Plasmodium sp.

Table 6. Antiparasitic Effects of Microalgae on Various Bacteria

Microalgea	Parasites It Affects	References
Cladophora crispata	*Echinococcus granulosus* (Hydatid cyst)	Athbi et al. (2014)
Chlorella vulgaris	*Steinernema feltiae* (Nematode)	Zielinsky et al. (2020)
Chroococcus minutus, Calothrix parietina, and *Gloeocapsa gigantea*	*Varroa destructor*	Hassan and Mahmoud (2006)

Antiparasitic effect

In addition to their antiprotozoal properties, compounds can also be isolated from algae and microalgae that are effective against multicellular parasitic organisms, especially parasitic animals. For example, alkaloid and ethyl acetate extracts from Cladophora crispata have been found to reduce the number and weight of hydatid cysts caused by Echinococcus granulosus (Athbi et al., 2014). In this study, the efficacy of these extracts was compared with the commonly used antiparasitic drug albendazole. Although the lowest number of cysts and the smallest cyst sizes after treatment were found in the albendazole-treated group, alkaloid and ethyl acetate extracts showed a similar effect.

Recent studies have shown that extracts of Chlorella vulgaris have a toxic effect on the nematode Steinernema feltiae (Zielinsky et al., 2020). These nematodes infect insects and kill their hosts through entomopathogenic bacteria. In the study, it was observed that hydrophilic extracts of C. vulgaris completely killed S. feltiae when applied at concentrations of 37.5, 75, and 150 mg/mL. Parasitic diseases are not only a major public health problem for humans, but also of great importance for domestic animals and agricultural production. Previous research shows that antiparasitic agents from the microalgae have been studied more than those from the microalgae. Therefore, further investigation of the antiparasitic potential of microalgae could contribute to the development of new treatment options in the future. Studies conducted mainly on honeybees (*Apis mellifera*) have shown that microalgae can be effective in controlling Varroa destructor mites. A lower infestation rate was found in hives fed with algae than in untreated hives. In colonies fed with the species Chroococcus minutus, Calothrix parietina, and Gloeocapsa gigantea, the average mite infestation rate was 2.7, compared to 26.26% in untreated control colonies. In the same study, a mite infestation rate of 2.9% was recorded in hives treated with oxalic acid (Hassan and Mahmoud, 2006). These data indicate that the antiparasitic potential of microalgae is considerable and that their effect against different parasite species should be investigated in more detail.

Conclusion

In recent years, parasitic, fungal, and bacterial pathogens threatening bee health have necessitated innovative solutions beyond conventional treatment methods. In this context, microalgae stand out as a multifaceted tool for bee health management, not only due to their nutritional value but also their antiparasitic, antifungal, and antibacterial properties. Studies reveal that microalgae species such as *Spirulina platensis*, *Chlorella vulgaris*, and *Nannochloropsis* exhibit inhibitory effects against common bee parasites like *Nosema ceranae*. Moreover, phenolic compounds, polysaccharides, and antimicrobial peptides in microalgal extracts demonstrate antifungal and antibacterial activity against pathogens such as *Ascosphaera apis* (chalkbrood) and *Paenibacillus larvae* (American foulbrood). These bioactive components may enhance individual and colony-level immunity by modulating bees' defense mechanisms. The therapeutic potential of microalgae could reduce reliance on chemical treatments, minimizing residue and resistance risks. However, further research is needed to elucidate their mechanisms of action, optimize dosages, and validate efficacy under field conditions. Investigating synergistic effects of different microalgae strains or their combination with probiotics represents a promising future direction. In conclusion, microalgae are not merely a nutritional supplement but also a natural bioprotective agent for beekeeping. Integrating microalgae-based strategies into sustainable apiculture could offer economic and ecological advantages. Advancing research in this field may revolutionize honeybee health management practices.

Corresponding author: mtafaj@ubt.edu.al

Abstract

Background and aim of study: Mastitis poses a major challenge in Albanian dairy farming, with subclinical mastitis (SCM) causing significant economic losses due to undetected infections. It results from interactions among environmental factors, pathogens, and host immunity. Contagious pathogens are often transmitted during milking, whereas environmental sources include bedding and manure. Research and practice have primarily concentrated on contagious microorganisms, with limited exploration of environmental factors affecting mastitis susceptibility and treatment efficacy. In Albanian dairy farms, subclinical mastitis (SCM) is frequently underdiagnosed due to insufficient awareness among farmers and veterinary professionals. Additionally, a standardized national surveillance system for SCM prevalence is absent. A comprehensive approach integrating both biotic and abiotic factors, as demonstrated in other countries, is crucial for addressing this issue under real farm conditions. Therefore, this study is undertaken with the aim of developing a practice-relevant methodological model for farmers and professionals to conduct an integrated assessment of the biotic and abiotic factors contributing to the occurrence of subclinical mastitis in dairy farms in Albania.

Methodology: This model quasi-protocol integrates a range of practical tools, including questionnaires for both quantitative and qualitative data collection, direct testing on dairy farms and animals, and rapid analytical methods for milk and feed samples. Additionally, professional evaluations from veterinarians or animal science experts are conducted, with findings communicated to farmers in an simple practical format. The implementation of the protocol involves the following steps: 1st step) collection of farmer information; 2nd) random selection of cows for testing; 3rd) on-farm assessment of clinical mastitis, udder and milking hygiene, and stable hygiene; 4th) administration of the California Mastitis Test (CMT); 5th) collection of milk samples from cows with subclinical mastitis (SCM) for agent investigation and rapid physicochemical testing; and 6th) evaluation of herd feeding status and feed quality through organoleptic assessment and rapid analysis using NIRS equipment.

Results: This practical model was tested in a study on nine Holstein dairy farms in Albania, spanning both lowland regions (Durrës and Shkodra) and hilly areas (Korça). The study involved measurements taken over 8 months of lactation, up to the onset of the dry period. On each farm, 6-10 cows in lactations 1-3 were randomly selected for CMT tests and milk sampling. The average productivity parameters were as follows: herd size ranged from 21 to 140 cows; daily milk production ranged from 12 to 30 kg; and the average days in lactation were 32-83 for the first measurement, 146-213 for the second, and 241-300 for the third. To assess the relationship between subclinical mastitis (SCM) and milk physicochemical properties under real farm conditions, no changes were made to housing, hygiene, or feeding practices, though these factors were documented. Variance and regression analyses using SPSS were conducted to evaluate the influence of biotic and abiotic factors on SCM and their interactions with other variables. The study concludes that this protocol is practical and easily applicable on Albanian dairy farms, for veterinarians, zootechnicians, and trained farmers alike.

Investıgatıon of the Effects of Propolis on Some Blood Parameters in Rainbow Trout (*Oncorhynchus Mykiss*) Exposed to Long-Term Bısphenol-A

Yağmur Ötün[1], Ahmet Regaib Oğuz [1]

[1]Van Yüzüncü Yıl University, Faculty of Science, Department of Biology, Van, Türkiye
Corresponding author: mtafaj@ubt.edu.al

Introduction

In recent years, studies have revealed the harmful effects of Bisphenol-A (BPA), whose use and production have increased, on living organisms. Many chemicals, like BPA, designed to simplify life, adversely affect it. Therefore, it is needed to identify alternative substances to replace these chemicals or to develop new compounds that can mitigate their harmful effects. Research has shown that many food products with antioxidant properties can counteract the toxic effects of xenobiotics. One such product is propolis, which has been used in alternative medicine for many years. It aims to investigate the effects of BPA long term sexposure on certain blood parameters in rainbow trout. Additionally, it seeks to explore the potential protective role of propolis in alleviating these harmful effects.

Material-Method

Rainbow trout were used as the experimental material in this study. The experimental setup consisted of a total of 8 groups, including fish exposed to BPA concentrations of 500, 1000, and 1500 µg/L, as well as BPA + propolis groups, where fish were fed with propolis-supplemented feed during the exposure. It lasted for 7 weeks. After experiment, blood samples were collected following the dissection of the fish, centrifuged, and analyzed for the necessary blood parameters.

Results

It was observed that different doses of BPA and propolis applied to rainbow trout affected the values of certain blood parameters following chronic toxicity exposure. The blood values obtained from the fish were analyzed and statistically evaluated.

Conclusion and Discussion

After analyses, different doses of BPA increased the levels of certain blood parameters in fish, indicating toxic effects. Other groups treated with propolis, a natural antioxidant, showed reduced levels of these blood parameters. Consequently, it can be stated that the application of propolis mitigated the toxicity caused by BPA in rainbow trout.

Bisfenol-A'ya Uzun Süreli Maruz Kalan Gökkuşağı Alabalığında (*Oncorhynchus Mykiss*) Propolisin Bazı Kan Parametreleri Üzerine Etkilerinin Araştırılması

Giriş

Son yıllarda kullanım alanı ve üretimi artış gösteren Bisfenol-A (BPA)'nın canlılar üzerindeki zararlı etkileri yapılan çalışmalarla ortaya konmuştur. BPA gibi hayatı kolaylaştırmak adına üretilen pek çok kimyasal hayatı olumsuz yönde etkilemektedir. Bu kimyasalların yerine konulacak alternatif maddelerin en kısa zamanda bulunması veya zararlı etkilerini azaltacak yeni maddelere ihtiyaç duyulmaktadır. Yapılan çalışmalarda ksenobiyotiklerin zararlı etkilerini giderecek antioksidan özellikte pek çok gıda ürünü bilinmektedir. Bunlardan birisi uzun yıllar alternatif tıpta kullanılan propolistir. Bu çalışma, BPA' nın uzun süreli maruziyetinin Gökkuşağı alabalığı üzerindeki bazı kan parametreleri açısından etkilerini incelemeyi amaçlamaktadır. Aynı zamanda, bu zararlı etkilerin hafifletilmesinde propolisin potansiyel koruyucu rolünü araştırmayı hedeflemektedir.

Materyal-Metot

Çalışmada materyal olarak Gökkuşağı alabalığı kullanılmıştır. Deney düzeneği, balıkların 500, 1000 ve 1500 µg/L BPA konsantrasyonlarına maruz bırakıldığı ve BPA + propolis gruplarının bu süreçte propolis ilaveli yemlerle beslendiği toplamda 8 gruptan oluşup 7 haftalık bir maruziyet süresini kapsamaktadır. Deney sonunda balıkların diseksiyon işlemin ardından kan örnekleri alınarak santrifüj edilip, gerekli kan parametreleri analiz edilmiştir.

Bulgular

Gökkuşağı alabalığına uygulanan farklı dozlardaki BPA ve propolis dozlarının kronik toksisite maruziyetinin ardından bazı kan parametrelerindeki değerleri etkilediği gözlemlendi. Balıklardan alınan kan değerlerinin veri analizi yapılarak istatiksel açıdan değerlendirilmesi yapıldı.

Sonuç ve Tartışma

Yapılan analizler sonucunda farklı dozlarda uygulanan BPA dozlarının balıkların bazı kan parametlerini seviyelerini artırarak toksitite etkisi yaptığını ve doğal bir antioksidan olan propolis uygulanan gruplarda ise bu kan parametrelerinin değerlerinin azaldığı gözlemlendi. Sonuç olarak, propolis uygulamasının Gökkuşağı alabalıklarında BPA'nın neden olduğu toksisiteyi azalttığı söylenebilir.

The Impact of Climate Change on Agricultural Insurance: The Role of Artificial Intelligence

Cevher Özden

Department of Computer Science, Faculty of Science and Literature, Çukurova University, Adana, Türkiye

Abstract

Climate change has significantly increased the frequency and severity of extreme weather events, posing serious risks to agricultural production and food security. Agricultural insurance plays a crucial role in mitigating financial risks for farmers by compensating for climate-related losses. However, the unpredictability of climate patterns challenges traditional risk assessment and premium calculation methods, threatening the sustainability of agricultural insurance systems. Recent advancements in Artificial Intelligence (AI) offer innovative solutions to enhance risk prediction, optimize premium pricing, and improve claims management. AI-driven models, utilizing machine learning and big data analytics, enable more accurate weather forecasting, early warning systems, and real-time damage assessments. This study explores how AI can strengthen agricultural insurance against climate change-induced uncertainties. Additionally, it discusses policy recommendations and technological innovations to enhance the resilience and efficiency of agricultural insurance systems in the face of climate change.

Keywords: *Climate change, artificial intelligence, agricultural insurance, risk assessment, machine learning, predictive modeling.*

İklim Değişikliğinin Tarım Sigortaları Üzerine Etkisi: Yapay Zekanın Rolü

Özet

İklim değişikliği, aşırı hava olaylarının sıklığını ve şiddetini artırarak tarımsal üretim ve gıda güvenliği üzerinde ciddi riskler oluşturmaktadır. Tarım sigortaları, çiftçilerin iklim kaynaklı kayıplarını telafi ederek finansal riskleri azaltmada önemli bir rol oynamaktadır. Ancak iklim değişikliğinin öngörülemez doğası, geleneksel risk değerlendirme ve prim hesaplama yöntemlerini zorlaştırarak tarım sigortalarının sürdürülebilirliğini tehdit etmektedir. Yapay Zeka (YZ), risk tahminlerini iyileştirmek, prim hesaplamalarını optimize etmek ve hasar yönetimini geliştirmek için yenilikçi çözümler sunmaktadır. Makine öğrenmesi ve büyük veri analitiği ile desteklenen YZ tabanlı modeller, daha doğru hava tahminleri, erken uyarı sistemleri ve gerçek zamanlı hasar tespitleri sağlamaktadır. Bu çalışma, yapay zekanın iklim değişikliği kaynaklı belirsizlikler karşısında tarım sigortalarını nasıl güçlendirebileceğini incelemektedir. Ayrıca, tarım sigortalarının dayanıklılığını ve verimliliğini artırmak için politika önerileri ve teknolojik yenilikler ele alınmaktadır.

Anahtar Kelimeler: *İklim değişikliği, yapay zeka, tarım sigortaları, risk değerlendirme, makine öğrenmesi, öngörüsel modelleme.*

Giriş

İklim değişikliği, tarım sektöründeki risk yapısını kökten değiştirmektedir. Kuraklıklar, seller ve fırtınalar gibi aşırı hava olaylarının sıklığı ve şiddeti artmış; bu durum hem çiftçiler hem de sigortacılar için benzeri görülmemiş zorluklar yaratmıştır. Birleşmiş Milletler Gıda ve Tarım Örgütü'ne (FAO) göre, doğal afetlerin yıllık meydana gelme oranı 1970'ler ve 1980'lere kıyasla şu anda üç kat daha fazladır. Tarım sektörü bu etkilerden orantısız şekilde etkilenmekte olup, afet kaynaklı kayıpların yaklaşık %63'ünü üstlenmektedir. Özellikle kuraklık, küresel ölçekte tarımsal üretim kaybının en büyük nedeni olarak öne çıkmaktadır.

İklim değişkenliğinin artması sonucu, ürün verimlerinde daha fazla dalgalanma yaşanmakta ve felaket düzeyinde kayıplar daha sık meydana gelmektedir. Bu durum, verim kayıplarının ve piyasa dalgalanmalarının öngörülemez hale gelmesine yol açmaktadır. Sektör uzmanlarının ifadelerine göre, küresel ısınma hava olaylarını giderek daha "öngörülemez" ve yıkıcı hale getirmiştir; bu da, geleneksel olarak istikrarlı risk istatistiklerine dayanan sigortacılık sektörüne derin bir belirsizlik enjekte etmektedir.

Gerçekten de, iklim değişikliği tarihsel modellere olan güveni sarsarken, sigortacılar "güven krizine" girmiştir. Bu istikrarsızlık, sigorta tazminatlarının ve primlerinin yükselmesine yol açmakta; hatta bazı sigortacıları yüksek riskli bölgelerden çekilmeye zorlamaktadır.

Tarım sigortası, çiftçilerin geçim kaynaklarını bu tür tehlikelere karşı koruyan kritik bir risk yönetim aracı olarak hizmet vermektedir. Kanıtlar, iklim değişikliğinin tarımsal üretimi ve gıda güvenliğini olumsuz etkilediğini, ancak

tarım sigortasının bu olumsuz etkileri hafifletebildiğini göstermektedir. Başka bir deyişle, etkili sigorta koruması, çiftçilerin iklim şoklarına karşı dayanıklılık geliştirmelerine yardımcı olur.

Bununla birlikte, geleneksel sigorta modelleri ve fiyatlandırma stratejileri, geçmişteki hava ve verim verilerine dayanıyordu ve bu yaklaşım günümüzde yetersiz kalmaktadır. Geçmişteki istatistiksel ilişkiler, değişen iklim desenleri karşısında artık daha az öngörücü hale gelmiştir; eski aktüeryal modeller yeni aşırılıklar ve oynaklıklar nedeniyle geçerliliğini yitirmiştir. Son dönem raporlarına göre, aşırı olayların hızla artan temposu, sigortacıları ürünlerini çok daha değişken bir çevreye göre yeniden tasarlamaya zorlamaktadır. Basitçe ifade etmek gerekirse, yalnızca geçmiş veriler artık değişen iklim koşullarında riskin tam bir resmini sunmamaktadır. Sigortacıların, ayakta kalabilmek için ileriye dönük iklim projeksiyonlarını da hesaba katmaları ve yeni yöntemler benimsemeleri gerekmektedir.

Bu noktada Yapay Zekâ (YZ) teknolojileri, tarım sigortasını bu zorluklar karşısında güçlendirmek için umut verici bir çözüm olarak ortaya çıkmıştır. Makine öğrenmesi ve veri analitiği gibi YZ teknikleri, karmaşık iklim verilerini analiz etmenin, yeni desenleri tespit etmenin ve geleneksel yöntemlerin ötesinde öngörü doğruluğunu artırmanın yenilikçi yollarını sunmaktadır. Sigorta sektöründe YZ, risk değerlendirmesinden poliçe düzenlemeye, prim hesaplamadan hasar yönetimine kadar değer zincirinin her aşamasında iyileştirme sağlayabilir.

Bu çalışma, iklim değişikliğinin tarım sigortası üzerindeki etkisini incelemekte ve YZ araçlarının sektöre nasıl uyum sağlama imkânı sunduğunu tartışmaktadır. İlerleyen bölümlerde, YZ'nin tarım sigortasına uygulanma yöntemleri özetlenecek, kuraklık risk tahmini için küçük ölçekli bir örnek model sunulacak ve ardından bu örneğin sonuçları ile YZ'nin risk değerlendirme, prim fiyatlandırması ve hasar işleme süreçleri üzerindeki daha geniş etkileri tartışılacaktır. Son bölümde ise anahtar bulgular ve öneriler sunulacaktır.

Tarım Sigortaları (Tarsim)

TARSİM (Tarım Sigortaları Havuzu) tarafından sunulan Bitkisel Ürün Sigortası, çiftçilerin doğal afetler ve çeşitli riskler nedeniyle karşılaşabilecekleri maddi kayıpları güvence altına almayı amaçlayan bir sigorta türüdür. Tarım ve Orman Bakanlığı'nın belirlediği kayıt sistemlerine kayıtlı parsellerde (açık alan) yetiştirilen bitkisel ürünler, meyve ağaçları, çay ve asmalar ile fidanlar bu sigorta kapsamında değerlendirilmektedir.

Teminat Kapsamındaki Riskler

Sigorta, aşağıdaki risklerin neden olacağı maddi zararları sigorta bedeline kadar teminat altına alır:

- Dolu, fırtına, hortum, yangın, deprem, heyelan, taşıt çarpması, sel ve su baskını nedeniyle ürünlerde meydana gelen miktar kaybı
- Dolunun yaş meyve, yaş sebze ve kesme çiçeklerde neden olduğu kalite kaybı
- Yaban domuzu ve geyik gibi yabani hayvanların tarla ürünleri, sebzeler, fidanlar ve çilekte neden olduğu miktar kaybı
- Kuşların, ayçiçeği ürünlerinin olgunlaşma ve hasat döneminde tohumları yemesiyle oluşan miktar kaybı
- Yağmurun, pamuk ve pamuk (sertifikalı tohumluk) ürünlerinde kozaların açılmasından itibaren hasada kadar olan dönemde neden olduğu miktar kaybı
- Don riskinin, meyve fidanları ve bağ fidanlarında neden olduğu miktar kaybı

İsteğe Bağlı Ek Teminatlar

Ek prim ödemesiyle aşağıdaki riskler de teminat kapsamına alınabilir:

- Don riskinin yaş meyveler, yağ gülü ve enginarda neden olduğu miktar kaybı
- Dolu ağı ve örtü ile destek (telli terbiye) sistemleri ve bu sistemlerin altında bulunan ürünlerde; dolu, dolu ağırlığı, kar ağırlığı, fırtına, hortum, yangın, deprem, heyelan, sel ve su baskını, taşıt çarpması risklerinin neden olduğu zararlar
- Yağmur riskinin; kiraz ve üzüm ürünlerinde olgunlaşma ve hasat dönemlerinde neden olduğu miktar kaybı ile taze tüketime yönelik olarak üretilen incirlerde olgunlaşma ve hasat dönemlerinde yol açtığı kalite kaybı, kurutmalık amaçlı üretilen incirlerde olgunlaşma ve buruklaşma dönemlerinden hasada kadar olan dönemde neden olduğu miktar ve kalite kaybı
- Dolu, fırtına, hortum, yangın, deprem, heyelan, taşıt çarpması, sel ve su baskını, yaban domuzu zararı risklerinin, arpa, buğday, çavdar, tritikale, yulaf ve kaplıca buğday ürünleri ile bu ürünlerin sertifikalı tohumluklarının sap kısmında neden olduğu miktar kaybı
- Dolu, fırtına, hortum, yangın, deprem, heyelan, taşıt çarpması, sel ve su baskını risklerinin, salamuralık yaprak üretimi yapılan asmaların yapraklarında neden olduğu miktar kaybı
- Sıcak havanın, altıntop, limon, mandalina, portakal ürünlerinde çiçeklenme, meyve tutumu ve küçük meyve dönemlerinde kuruma, dökülme; üzümlerde ise çiçeklenme ve tane bağlama dönemlerinde salkımlarda tane tutumunun gerçekleşmemesi ve tanede büyümenin durması, kuruması ve dökülmesi şeklinde neden olduğu miktar kaybı
- Don riskinin, şekerpancarı, kabak (çerezlik), domates, biber, patlıcan, kavun, karpuz, patates ürünlerinde fide ve yapraklanma döneminde yeniden ekim dikime neden olacak şekilde meydana getirdiği zararlar

Devlet Desteği
Bitkisel Ürün Sigortası'nda üreticilerin priminin %50'si, meyvelerde ise don teminatı priminin %67'ye varan kısmı devlet tarafından karşılanmaktadır.

İklim Değişikliği ve Tarım Üzerindeki Etkileri

İklim değişikliği, tarımda riskleri çeşitli mekanizmalar yoluyla artırmaktadır. Bu etkiler Tablo 1'de özetlenmiştir.

Tablo 1. İklim Değişikliğinin Tarımsal Üretim Üzerindeki Etkileri

Etki Kategorisi	Açıklama
Sıcaklık Artışı	Bitkilerde ısı stresi, büyüme dönemlerinin kısalması
Yağış Desenlerinde Değişim	Artan kuraklık ve sellerin toprak ve ürünler üzerindeki olumsuz etkileri
Artan Zararlı ve Hastalıklar	Zararlı ve hastalıkların yaygınlığında değişimler
Aşırı Hava Olayları	Fırtına, dolu, don gibi olayların ani kayıplara yol açması

(Kaynak: IPCC, 2022'den uyarlanmıştır)

Elif Çekici (2009), tarımın iklim değişkenliklerine en duyarlı sektörlerden biri olduğunu vurgulamış; kuraklıkların, sellerin ve beklenmeyen don olaylarının ürün verimlerinde ciddi düşüşlere yol açtığını belirtmiştir. Damlama sulama gibi teknolojik ilerlemelere rağmen, çiftçiler doğadan kaynaklanan riskleri tamamen ortadan kaldıramamaktadır.

Tarım Sigortası Üzerindeki Etkiler

İklim değişikliği, tarım sigortası sistemleri üzerinde baskı oluşturarak hasarların sıklığını ve şiddetini artırmaktadır. Başlıca etkiler şunlardır:

- Hasar Sıklığında Artış: Aşırı hava olaylarının daha sık meydana gelmesi, hasar taleplerinin artmasına yol açmaktadır (Torusdağ ve diğ., 2024).
- Öngörülebilirlikte Azalma: Tarihsel modellere olan güven azalmakta, bu da risk değerlendirmesini zorlaştırmaktadır (Torusdağ ve diğ., 2024).
- Prim Artışları: Yükselen riskler, sigorta primlerinin yükselmesine neden olmakta ve çiftçiler için sigorta erişimini zorlaştırmaktadır (Torusdağ ve diğ., 2024).

Türkiye'de tarım sigortası, 2005 yılında devlet destekli sigortanın TARSİM (Tarım Sigortaları Havuzu) aracılığıyla devreye girmesiyle önemli ölçüde ivme kazanmıştır. Şengün ve Özden'e (2022) göre, mevcut sigorta programlarına rağmen çiftçiler sigortayı genellikle pahalı bulmakta ve kapsamı yetersiz olarak değerlendirmektedir; bu da politika tasarımı ile çiftçi beklentileri arasında önemli boşluklar olduğunu göstermektedir.

Tablo 2. İklim Değişikliği Altında Tarım Sigortasının Karşılaştığı Zorluklar

Zorluk	Sonuç
Hasar Sıklığında Artış	Primlerin Yükselmesi ve Kapsamın Daralması
Risk Öngörülebilirliğinin Azalması	Poliçe Düzenleme (Underwriting) Zorlukları
Çiftçi Algı Problemleri	Düşük Katılım Oranları

Ayrıca, Çekici (2009) tarım sigortalarının, iklim değişikliğinin etkilerine karşı anlamlı olabilmesi için, kuraklığa bağlı verim kayıplarına karşı da koruma gibi daha geniş kapsamlar içerecek şekilde evrilmesi gerektiğini vurgulamıştır.

Yapay Zeka'nın Tarım Sigortasında Kullanımı
İklim değişikliğinin yarattığı yeni risk ortamında, geleneksel tarım sigortası yöntemleri artık yeterli gelmemektedir. Yapay Zeka (YZ), bu zorlukların aşılmasında güçlü bir çözüm aracı olarak öne çıkmaktadır. YZ teknikleri, tarım sigortasında birçok aşamada etkili bir şekilde kullanılabilir:
a) Risk Değerlendirme ve Önceden Tahmin
Makine öğrenmesi ve veri analitiği yöntemleri sayesinde çok büyük ve karmaşık iklim, toprak ve ürün verileri analiz edilebilir. Bu sistemler:

- Geçmiş hava olayları ile ürün zararları arasındaki ilişkileri daha doğru biçimde modelleyebilir.
- Geleneksel aktüeryal (sigorta matematiği) modellerin ötesine geçerek, gelecekteki riskleri iklim projeksiyonlarına dayalı olarak öngörebilir.
- Yeni gelişen riskleri (örneğin, farklı bölgelerde yaygınlaşmaya başlayan zararlı hastalıklar) erken tespit edebilir.

b) Prim Fiyatlandırması
Yapay zeka sistemleri:
- Her çiftçi, ürün türü ve coğrafi bölge için kişiselleştirilmiş risk puanları oluşturabilir.
- Böylece prim hesaplamalarını daha adil ve hassas hale getirerek, aşırı prim artışlarının önüne geçebilir.
- Özellikle küçük ölçekli üreticiler için daha erişilebilir sigorta paketleri tasarlanmasına olanak tanır.

c) Hasar Tespiti ve Tazminat Süreçleri
- Uydu görüntüleri, insansız hava araçları (drone) verileri ve IoT (Nesnelerin İnterneti) sensörlerinden toplanan bilgiler, YZ ile analiz edilerek hızlı ve doğru hasar tespiti yapılabilir.
- Yapay zeka tabanlı sistemler, sahada birebir ekspertiz ihtiyacını azaltabilir, böylece hasar ödemeleri çok daha hızlı gerçekleşir.
- Bu, çiftçilerin gelir kaybını hızla telafi etmelerine yardımcı olur ve sigortaya olan güveni artırır.

d) Sahtekârlık Önleme
- YZ algoritmaları, olağan dışı hasar başvurularını ve dolandırıcılık şüphelerini erken aşamada tespit edebilir.
- Böylece sistemin finansal sürdürülebilirliği korunmuş olur.

Küçük Ölçekli Uygulama: Kuraklık Riski Tahmin Modeli
Bu çalışmada, YZ'nin tarım sigortasına uygulanabilirliğini göstermek amacıyla küçük ölçekli bir kuraklık risk tahmin modeli geliştirilmiştir. Model, geçmiş yıllara ait sıcaklık, yağış ve toprak nem verilerini kullanarak, belirli bölgelerdeki kuraklık olasılığını tahmin etmektedir. Bu tür modeller:
- Kuraklık teminatlı sigorta ürünlerinin daha hassas ve gerçekçi şekilde yapılandırılmasını sağlar.
- İleriye dönük tarımsal üretim planlaması ve devlet destekli sigorta programlarının daha etkin hale getirilmesine katkı sunar.

Sonuç

İklim değişikliği, tarımsal sürdürülebilirlik ve bunu destekleyen sigorta sektörü için giderek büyüyen bir tehdit oluşturmaktadır. Tarihsel iklim istikrarına dayanan geleneksel sigorta modelleri, artık etkili olma özelliğini büyük ölçüde yitirmiştir. Tarım sigortasının geleceğini güvence altına almak için, yeni teknolojileri, kamu-özel sektör iş birliğini ve çiftçi katılımını içeren dinamik ve ileriye dönük yaklaşımlar gereklidir. Yapay zeka modellerinin çığır açan sonuçları, sigorta tahmin modellerine olası entegrasyonları açısından bilimsel olarak detaylı bir şekilde incelenmelidir.

Extraction and Isoelectric Precipitation of Protein from Hazelnut Meal

Esra Kibar Balballı, Gülşah Karabulut

Food Engineering Department,Faculty of Engineering, Sakarya University, Sakarya, Türkiye

Abstract

This study investigates the two-stage protein extraction from hazelnut meal and the evaluation of isoelectric precipitation efficiency. In the first extraction stage, proteins were extracted at pH 8, 9, and 10 for one hour, followed by a second extraction on the residual solids. The first extraction yielded 9649, 10238, and 10355 mg/mL at pH 8, 9, and 10, respectively, indicating increased solubility at higher pH. The second extraction recovered additional protein but with lower efficiency, yielding 8599, 8677, and 8838 mg/mL at pH 8, 9, and 10, respectively. A two-stage extraction was found to enhance overall protein recovery, but further extractions beyond this point may not be efficient. The study also examined the precipitation efficiency at the isoelectric point (pI = 4.5). After the first extraction, supernatant protein concentrations were 291, 279, and 299 mg/mL at pH 8, 9, and 10, demonstrating effective precipitation. Similar results were obtained for the second extraction, confirming the efficiency of the precipitation step. Additionally, proteins extracted at pH 10 were precipitated at different pH values, with supernatant concentrations of 644 (pH 3.5), 341 (pH 4), 336 (pH 4.5), and 347 mg/mL (pH 5). These findings highlight that a pH 9-10 extraction followed by precipitation at pH 4.5 maximizes protein recovery and precipitation efficiency. The study provides insights into optimizing protein isolation from hazelnut meal for potential applications in food processing.

Key Words: *Hazelnut meal, protein extraction, isoelectric precipitation, pH optimization, protein recovery.*

Combine Activated Carbon and Calcium Hydroxide to Lower the Salinity of Irrigation Water

Elbar Djenette[1], Rekis Abdelkrime[1], Elbar Chaima Yasmin[2]

[1]Center for Scientific and Technical Research for Arid Regions Biskra (CRSTRA) ALGERIA
[2]University Of Biskra ALGERIA
** Corresponding author: elbardjenette@gmailom*

Abstract

High salt concentrations in irrigation water in arid regions can lead to significant nutritional imbalances, adversely affecting plant growth and productivity. The use of such water can also cause sodium fixation in soil, contributing to salinization that degrades soil quality, resulting in clay dispersion, structural deterioration, reduced permeability, and plant asphyxiation. Our treatment method combines activated carbon and calcium hydroxide, leveraging activated carbon's high adsorption capacity for chemical compounds. Calcium hydroxide ($Ca(OH)_2$) is an effective, cost-efficient alkaline product that enhances water quality by neutralizing acidity, softening, purifying, and removing turbidity and impurities. In our methodology, we activate charcoal from palm residues with citric acid and mix it with calcium hydroxide to reduce chloride levels, resulting in clean water that meets salinity standards. The application of this mixture to saline irrigation water yielded a 20-40% reduction in ion levels (calcium, magnesium, sodium, potassium, carbonate, and bicarbonate), demonstrating the treatment's effectiveness. These results support the design considerations for using activated carbon from palm residues alongside calcium hydroxide to lower salinity levels. Given these promising findings, further research is necessary to assess the long-term stability of the treated water and its suitability for various agricultural applications. We plan to conduct field trials to evaluate the treatment's performance under different environmental conditions and its effects on soil health and crop yield. Additionally, we will analyze the economic feasibility of scaling up the process, taking into account raw material costs and potential benefits for farmers facing salinity challenges.

In conclusion, our initial findings indicate that utilizing activated charcoal derived from palm residues in combination with calcium hydroxide presents a viable solution for salinity remediation in irrigation. This eco-friendly approach not only helps manage saline water but also promotes agricultural waste recycling, contributing to a more sustainable farming future.

Keywords: salinity, irrigation water, activated charcoal, citric acid, Calcium hydroxide.

Food Safety in Hazelnut Enterprises: Risks and Solution Suggestions

Rabia Cemre Yayla[1], Hasan Karaosmanoğlu[2]

[1]Giresun University, Institute of Science, Department of Hazelnut and Hazelnut Products, Giresun, Türkiye
*[2]*Giresun University Bulancak Vocational School, Hazelnut Expertise Program, Giresun, Türkiye*

Abstract

This study examines food safety in hazelnut firms, the associated hazards, and the techniques for risk management. In sensitive agricultural goods like hazelnuts, aflatoxin contamination, microbiological and chemical hazards, hygiene inadequacies, and environmental factors are significant threats to food safety. Mitigating these dangers is essential not only to safeguard consumer health but also to enhance Türkiye's worldwide trade potential in the hazelnut industry. The research underscores the necessity of adopting international standards like HACCP and ISO 22000 in hazelnut firms, asserting that contemporary processing and storage methods enhance product quality by maintaining circumstances of low temperature and relative humidity. Moreover, stringent regulation of pesticides, the establishment of routine testing techniques, and adherence to hygiene standards are advised to avert chemical and microbiological contamination. Enhancing employee hygiene awareness and environmental sanitation contributes to the sustainability of food safety in organizations. The implementation of modern technology, including sensor-based monitoring systems and inert gas atmospheres, along with adherence to international food safety regulations, is essential for ensuring safe production processes and enhancing competitiveness in hazelnut firms. Therefore, ensuring food safety in hazelnut operations not only protects consumer health but also plays a crucial role in maintaining the sustainability of Türkiye's agricultural exports.

Fındık İşletmelerinde Gıda Güvenliği: Riskler ve Çözüm Önerileri

Özet

Bu çalışma, fındık işletmelerinde gıda güvenliği kavramını, karşılaşılan riskleri ve bu risklerin yönetimine yönelik stratejileri ele almaktadır. Fındık gibi hassas tarımsal ürünlerde afla toksin kontaminasyonu, mikrobiyolojik ve kimyasal riskler, hijyen eksiklikleri ve çevresel faktörler, gıda güvenliğini tehdit eden en önemli unsurlar arasında yer almaktadır. Bu risklerin kontrol altına alınması, yalnızca tüketici sağlığını korumakla kalmayıp, Türkiye'nin fındık sektöründeki uluslararası ticaret kapasitesini artırmak için de bir zorunluluktur. Araştırmada, HACCP ve ISO 22000 gibi uluslararası standartların fındık işletmelerinde uygulanmasının önemi vurgulanmakta; modern işleme ve depolama tekniklerinin, düşük sıcaklık ve bağıl nem gibi koşulların sağlanmasıyla ürün kalitesini artırdığı ifade edilmektedir. Ayrıca, kimyasal ve mikrobiyolojik kontaminasyonların önlenmesi için tarım ilaçlarının sıkı denetimi, düzenli test protokollerinin uygulanması ve hijyen standartlarına uyum önerilmektedir. Çalışanların hijyen farkındalığının artırılması ve çevresel hijyenin iyileştirilmesi de işletmelerde gıda güvenliğinin sürdürülebilirliğine katkı sağlamaktadır. Sonuç olarak, yenilikçi teknolojilerin (örneğin, sensör tabanlı izleme sistemleri ve inert gaz atmosferleri) benimsenmesi ve uluslararası gıda güvenliği standartlarına uyum, fındık işletmelerinde güvenli üretim süreçlerinin sürdürülmesi ve rekabet gücünün artırılması açısından kritik bir rol oynamaktadır. Bu bağlamda, fındık işletmelerinde gıda güvenliğinin sağlanması, yalnızca tüketici sağlığını korumakla sınırlı kalmayıp, aynı zamanda Türkiye'nin tarımsal ihracatında sürdürülebilirliği sağlamanın temel taşlarından biri olarak değerlendirilmektedir.

Anahtar Kelimeler: *Fındık işletmeleri, gıda güvenliği, gıda güvenliği yönetim sistemleri, ISO 22000, Hijyen ve Sanitasyon*

Giriş

Corylus avellana familyasında yer alan ve cevizle birlikte Avrupa'da yetiştiriciliği en fazla yapılan kuruyemiş olan fındığın en önemli üreticisi Türkiye'dir (% 62). Türkiye'yi İtalya (% 13), ABD (%6), Azerbaycan (%5), Şili (%3), Gürcistan (%3) ve Çin (%2) takip etmektedir (Karaosmanoğlu, 2025). Avrupa açısından ekonomik önemine ilaveten, fındık içerdiği tekli doymamış yağ asitleri, tokoferoller, fitosteroller gibi yağ bileşenlerinin yanı sıra biyolojik olarak aktif polifenoller gibi fitokimyasallar nedeniyle insan beslenmesi açısından önemli bir role sahiptir (Karaosmanoğlu, 2024; Karaosmanoglu 2023a). Yüksek oranda yağ içermesi, sahip olduğu özel aromasının yanı sıra gevrek tekstürü nedeniyle çerez olarak tüketiminin yanı sıra başta çikolata endüstrisi olmak üzere şekerleme ve pastacılık alanlarında yoğun olarak kullanılmaktadır (Karaosmanoğlu ve Üstün, 2019).

Gıda güvenliği, halk sağlığını ve ekonomik sürdürülebilirliği korumada kritik bir unsurdur. Fındık gibi tarımsal ürünlerin işlenmesinde ortaya çıkabilecek kimyasal ve biyolojik tehlikeler, tüketici sağlığını doğrudan tehdit etmektedir. Afla toksin kontaminasyonu, hijyen eksiklikleri ve yetersiz depolama koşulları hem halk sağlığı hem de ihracat potansiyeli açısından önemli riskler oluşturmaktadır. Gıda kaynaklı hastalıklardan kaynaklanan üretkenlik kaybı ve tıbbi harcamalar, ekonomik değeri yüksek olan fındık ihracatını da olumsuz etkileyebilir (Jaffee et al., 2018).

Fındık ürünleri, üretimden tüketime kadar geçen süreçte biyolojik, kimyasal ve fiziksel risklere açık bir gıda grubudur. Özellikle afla toksin kontaminasyonu, kimyasal kalıntılar ve mikrobiyolojik tehditler, tüketici güvenini sarsabilir ve uluslararası pazarlarda ciddi sorunlara yol açabilir (Karaosmanoglu, 2023b; Chen et al., 2023). Bu nedenle, fındık işletmelerinde gıda güvenliğinin sağlanması yalnızca halk sağlığı açısından değil, aynı zamanda ekonomik sürdürülebilirlik ve ticari başarı açısından da hayati bir gerekliliktir.

Gıda güvenliği konusunda yapılan araştırmalar genellikle üretim veya tüketim aşamalarına odaklanmakta, ancak işleme, taşıma ve depolama gibi kritik ara aşamalar yeterince değerlendirilmemektedir (Reardon, 2015). Bu süreçlerin kontrol altına alınması hem kalite korunumu hem de ihracat başarı şansı açısından belirleyici bir rol oynamaktadır. Bu bağlamda, risk temelli yaklaşımlarla desteklenen entegre gıda güvenliği yönetim sistemlerinin uygulanması kaçınılmazdır (Food Standards Agency et al., 2020).

HACCP gibi yönetim sistemleri, risk değerlendirmesi sonucunda fındık üretim ve işleme süreçlerindeki kritik kontrol noktalarını belirlemeye ve bu noktalarda gerekli önlemleri almaya olanak tanır. Böylece afla toksin kontaminasyonu veya kimyasal kirleticiler gibi potansiyel tehlikeler, erken tespit edilip kontrol altına alınabilir (Sartoni et al., 2025).

Fındık işletmelerinde bu sistemlerin etkinliği, sektöre özgü ön koşul programlarının ve HACCP ilkelerine dayalı yapıların benimsenmesiyle artırılabilir. Aynı zamanda bu sistemlerin sürdürülebilirliği, işletme ölçeği, çalışan eğitimi, teknolojik altyapı ve izleme rutinlerinin kalitesi gibi faktörlerden etkilenmektedir (Nguyen & Li, 2022).

Sonuç olarak, fındık işletmelerinde gıda güvenliği, yalnızca hijyen kurallarıyla sınırlı kalmamalı; mevzuat uyumu, risk yönetimi ve teknolojik uygulamalarla desteklenmelidir. Bu çalışma, fındık işletmelerinde gıda güvenliği yönetim sistemlerinin önemi, karşılaşılan riskler ve çözüm önerileri üzerine kapsamlı bir değerlendirme sunmayı amaçlamaktadır (Matthews, 2014; Panghal et al., 2018).

Fındık İşletmelerinde Gıda Güvenliği Yaklaşımı

Fındık sektörü, üretimden tüketiciye uzanan tedarik zinciri boyunca çok sayıda güvenlik riskine maruz kalmaktadır. Bu riskler; biyolojik (mikroorganizma kontaminasyonu), kimyasal (pestisit kalıntıları, afla toksinler) ve fiziksel (yabancı maddeler) olarak sınıflandırılabilir. Bu tür tehditlerin kontrol altına alınabilmesi için sistematik ve bilimsel temellere dayanan bir gıda güvenliği yönetimi gereklidir.

Tehlike Analizi ve Kritik Kontrol Noktaları (HACCP) sistemi, fındık işletmelerinde uygulanabilecek en etkili önleyici kontrol mekanizmalarından biridir. Bu sistem, tüm gıda işleme süreci boyunca kritik kontrol noktalarının belirlenmesine, bu noktalarda tehlikelerin tanımlanmasına ve kontrol önlemlerinin uygulanmasına imkân tanır (Motarjemi & Lelieveld, 2014). HACCP, nihai ürün analizine dayalı geleneksel yöntemlerin aksine, riskleri ortaya çıkmadan önce önlemeye odaklanır.

Ancak yalnızca HACCP'in uygulanması yeterli değildir. Günümüzde giderek daha fazla işletme, tüm tedarik zincirini kapsayan entegre gıda güvenliği yönetim sistemlerine yönelmektedir. Bu kapsamda ISO 22000 standardı öne çıkmaktadır. ISO 22000, HACCP'i de içinde barındıran, risk temelli düşünceye dayalı ve organizasyonel bağlama uygunluk sağlayan bir çerçeve sunar (Başaran, 2016).

ISO 22000'in sunduğu sistematik yapı sayesinde, gıda güvenliği yönetimi yalnızca üretim aşamasında değil, aynı zamanda taşıma, depolama ve dağıtım gibi zincirin tüm aşamalarında kontrol altına alınabilir. Bu durum, fındık gibi hassas ürünlerin güvenliğini sağlamada büyük avantaj sunar. Ayrıca, ISO 22000 standardı, iç ve dış iletişim mekanizmalarının güçlendirilmesi, sürekli iyileştirme süreçlerinin işletilmesi ve izlenebilirlik gibi konularda da işletmelere değer katar (WCS, 2017).

Bununla birlikte, fındık işletmelerinin HACCP ve ISO 22000 sistemlerini benimsemesi; sadece belge sahibi olmakla sınırlı kalmamalı, aynı zamanda sistemlerin gerektirdiği eğitim, denetim, ekipman uygunluğu ve kurumsal kültürün oluşturulması gibi gereklilikler de yerine getirilmelidir. Aksi takdirde, bu sistemlerin uygulamada etkinliği sınırlı (Öztürk & Arıcı, 2019).

Sonuç olarak, fındık işletmelerinde etkin bir gıda güvenliği yaklaşımı için yalnızca mevzuatlara uyum değil; aynı zamanda eğitim, teknoloji kullanımı, proses takibi ve kurumsal farkındalık da temel unsurlar olarak değerlendirilmelidir.

Risk Faktörleri ve Tehditler

Fındık işletmeleri, üretimden tüketime kadar olan süreçte birçok risk faktörüyle karşı karşıya kalmaktadır. Bu riskler genel olarak mikrobiyolojik, kimyasal ve fiziksel kontaminasyonlar şeklinde sınıflandırılabilir. Her bir risk grubu hem ürün kalitesi hem de tüketici sağlığı üzerinde doğrudan tehdit oluşturmaktadır.

Mikrobiyolojik Riskler

Fındık ürünleri, özellikle hijyen eksikliklerinin bulunduğu işletmelerde Salmonella, Listeria ve E. coli gibi patojenlerle kontamine olabilmektedir. Bu mikroorganizmalar; uygun olmayan personel hijyeni, kirli ekipman kullanımı ve yetersiz sanitasyon uygulamaları sonucu gıdaya bulaşmaktadır (Vaillant et al., 2005). Ayrıca, bu bakteriler termal işleme dayanıklı olup uzun raf ömrü boyunca canlı kalabilmektedir. Dünya genelinde gıda zehirlenmelerinin %90'ından fazlasının mikrobiyal kontaminasyondan kaynaklandığı bilinmektedir (Fung et al., 2018). Bu nedenle fındık işletmelerinde düzenli mikrobiyolojik analizler, hijyen protokolleri ve sanitasyon programları zorunludur.

Kimyasal Güvenlik Riskleri

Kimyasal kirlenme, fındık işletmeleri açısından ciddi sağlık ve ticari sonuçlar doğurabilecek bir diğer önemli tehlikedir. Tarım ilaçları kalıntıları, ağır metaller (kurşun, arsenik, kadmiyum, cıva vb.) ve proses ekipmanlarından sızan maddeler, ürünlerin kimyasal güvenliğini tehdit etmektedir (Fung et al., 2018). Özellikle afla toksinler, Aspergillus flavus ve Aspergillus parasiticus türü mantarlar tarafından üretilen, kansorejen etkiye sahip toksinlerdir ve fındıkta en yaygın görülen kimyasal risk faktörüdür (Siciliano et al., 2016). Afla toksinler, termal işlemlerde parçalanmaz ve ürünün raf ömrü boyunca stabil kalabilir. Bu nedenle, üretimin her aşamasında kimyasal risk yönetimi büyük önem taşımaktadır.

Fiziksel Tehlikeler

Fındıkların işlenmesi ve paketlenmesi sırasında cam, metal, taş, plastik parçacıkları gibi fiziksel kontaminantların ürüne karışması, tüketici açısından önemli bir sağlık riski yaratmaktadır. Bu tür bulaşmalar genellikle ekipman arızaları, zayıf kalite kontrol sistemleri ya da yetersiz eğitimli personel kaynaklıdır. Fiziksel risklerin kontrolü için metal dedektörleri, optik ayırıcılar ve etkili kalite güvence sistemlerinin kullanımı gereklidir (Frank et al., 2011).
Tüm bu risk faktörleri, fındık ürünlerinin iç ve dış pazarda güvenilirliğini doğrudan etkileyen unsurlardır. Bu nedenle, işletmelerin üretim zinciri boyunca etkili bir izleme ve kontrol sistemi oluşturması elzemdir (Silver & Bassett, 2008).

Depolama, Taşıma ve İşleme Koşulları

Fındık ürünlerinin kalitesi ve güvenliği, yalnızca üretim aşamasında değil, aynı zamanda depolama, taşıma ve işleme koşullarında da belirlenmektedir. Hasat sonrası süreçlerde uygulanan yöntemlerin yetersizliği, ürünlerde mikrobiyolojik ve kimyasal kontaminasyon riskini artırarak gıda güvenliğini tehdit eder hale getirebilir (Silvestri et al., 2021).
Depolama koşulları, özellikle afla toksin oluşumunu etkileyen temel faktörlerden biridir. Afla toksin üreten mantarlar, sıcak ve nemli ortamlarda kolaylıkla çoğalabildiğinden dolayı, fındıkların düşük sıcaklıkta ve %60'tan az bağıl nem seviyesinde saklanması önerilmektedir. Bu parametrelerin kontrol altında tutulması hem raf ömrünü uzatmakta hem de toksik maddelerin oluşumunu sınırlandırmaktadır (Mencarelli et al., 2008).
Ayrıca, inert atmosfer teknikleri (örneğin; azot- N_2 veya karbondioksit- CO_2 ile doyurulmuş ortamlar), oksijenin depolama alanlarından uzaklaştırılmasını sağlayarak kimyasal oksidasyonu azaltır. Bu yöntem, özellikle lipid oksidasyonu ve renk bozulmalarını önlemede etkin bir rol oynar. Böylelikle ürünün besin değeri ve duyusal özellikleri korunabilir (Yurttas et al., 2000).
Taşıma süreci de gıda güvenliğini etkileyen önemli bir halkadır. Uygun olmayan taşıma araçları, hijyenik olmayan yüzeylerle temas, aşırı sıcaklık ve nem gibi çevresel faktörler, fındığın güvenliğini riske atmaktadır. Bu noktada, taşıma araçlarının düzenli dezenfekte edilmesi ve sıcaklık-nem izleme sistemleri ile donatılması önerilmektedir (Ghirardello et al., 2014).
İşleme alanlarında hijyen, sadece ürün kalitesini değil, aynı zamanda çalışan sağlığını da doğrudan etkileyen bir unsurdur. Gıda ile temas eden ekipmanların yüzey temizliği, iş elbiseleri, kişisel hijyen ve çevresel hijyen gibi faktörler bir bütün olarak değerlendirilmelidir. Üç kritik bölge olan gıda bölgesi, sıçrama bölgesi ve gıda dışı bölge, temizlik ve dezenfeksiyon açısından farklı stratejilerle ele alınmalı ve düzenli kontrol edilmelidir (Covolan, 2024).
Sonuç olarak, fındık işletmelerinde yalnızca üretim süreçlerinin değil; depolama, taşıma ve işleme süreçlerinin de bilimsel ilkelere uygun olarak yönetilmesi, gıda güvenliğinin sürdürülebilirliği açısından vazgeçilmezdir.

Gıda Güvenliği Sistemlerinin Etkinliği ve Uygulanabilirliği

Fındık işletmelerinde gıda güvenliği sistemlerinin etkin bir şekilde uygulanabilmesi, yalnızca teknik altyapıya değil, aynı zamanda organizasyonel kapasiteye, çalışan eğitimi düzeyine ve yönetim anlayışına da bağlıdır. Özellikle küçük ve orta ölçekli işletmeler (KOBİ'ler), bu sistemleri uygulama konusunda çeşitli zorluklarla (Mensah & Julien, 2011).

HACCP ve ISO 22000 gibi sistemlerin etkili olması için, yalnızca teknik dökümantasyon yeterli değildir. Bu sistemlerin başarıyla sürdürülebilmesi; personelin farkındalık düzeyi, yönetim desteği, düzenli iç denetimler ve sürekli iyileştirme döngüsünün varlığı gibi birçok faktörü bir arada gerektirir. Bu bağlamda, işletmelerde gıda güvenliği kültürü oluşturulması büyük önem taşımaktadır (Nguyen & Li, 2022).

Özellikle HACCP sisteminin işlevsel hâle gelebilmesi için ön koşul programlarının (örneğin: temizlik ve sanitasyon programları, haşere kontrolü, ekipman kalibrasyonu) sistematik biçimde işletilmesi gerekir. Ön koşulların eksik olduğu durumlarda, HACCP'in etkili çalışması mümkün değildir.

Gıda Güvenliği Yönetim Sistemlerinin mevcut performansını değerlendirmek amacıyla teşhis araçları, iyileştirme matrisleri ve seçim kılavuzları gibi araçlar geliştirilmiştir. Jacxsens ve arkadaşlarının (2010) geliştirdiği teşhis modeli, işletmelerin bağlam durumu, kontrol faaliyetleri ve çıktı performansı gibi bileşenleri analiz ederek güçlü ve zayıf yönlerin belirlenmesini sağlamaktadır. Bu analizler sayesinde, işletmeler kısa, orta ve uzun vadeli geliştirme planları oluşturabilir (Luning et al., 2008; Luning et al., 2011).

Ayrıca, Mikrobiyal Değerlendirme Şeması (MAS) gibi protokollerle yapılan değerlendirmeler, gıda güvenliği performansının ölçülmesine katkı sağlamaktadır. MAS, mikrobiyolojik verilerin sistematik şekilde analiz edilmesini ve potansiyel darboğazların tanımlanmasını kolaylaştırır (Jacxsens et al., 2010).

Bu sistemlerin sürdürülebilirliği açısından, devlet desteklerinin ve uluslararası proje fonlarının özellikle KOBİ'lere yönelik olarak artırılması önemlidir. Gıda güvenliği düzenlemelerinin yerel düzeyde uygulanabilir hâle getirilmesi, sektörel katılımı artıracak ve sistemlerin sahada işlerliğini kolaylaştıracaktır.

Kısacası, fındık işletmelerinde gıda güvenliği sistemlerinin etkinliği yalnızca teknik bilgiye değil; aynı zamanda bütüncül, sürekli geliştirilebilir ve işletmeye özgü uyarlanabilir bir yaklaşım gerektirir.

Sonuç ve Öneriler

Fındık işletmelerinde gıda güvenliği; üretim, işleme, depolama ve dağıtım süreçlerinin tamamını kapsayan bütüncül bir yaklaşım gerektirmektedir. Afla toksin kontaminasyonu, mikrobiyolojik ve kimyasal riskler ile hijyen eksiklikleri, sektörde karşılaşılan başlıca sorunlar arasında yer almaktadır. Bu sorunların kontrol altına alınabilmesi için HACCP ve ISO 22000 gibi sistemlerin etkili biçimde uygulanması büyük önem taşımaktadır.

Fındık işletmelerinde modern depolama koşulları, inert atmosfer uygulamaları, mikrobiyolojik test protokolleri ve çalışan hijyenine yönelik eğitimler, gıda güvenliği sistemlerinin başarısını doğrudan etkilemektedir. Aynı zamanda, teşhis ve değerlendirme araçlarının kullanımı, işletmelerin güçlü ve zayıf yönlerini görmelerine yardımcı olmakta; sürekli iyileştirme anlayışını desteklemektedir.

- Gıda güvenliği sistemlerinin (HACCP, ISO 22000) uygulanması teşvik edilmeli ve zorunlu hâle getirilmelidir.
- Depolama, işleme ve taşıma süreçlerinde sıcaklık ve nem kontrolü sağlanmalı, inert atmosfer teknolojileri yaygınlaştırılmalıdır.
- Tarım kimyasalları ve proses ekipmanları düzenli analizlerle denetlenmelidir.
- Çalışanlara yönelik hijyen ve sanitasyon eğitimleri periyodik olarak düzenlenmelidir.
- KOBİ'ler için teknik destek ve finansal teşvik programları geliştirilmeli, mevzuat yerel ölçeklere uyarlanmalıdır.

Fermented Foods and Human Health

Souhila Mazguene

Biological and Chemical Food Division, Agri-Foods Technologies Research Center (CRTAA), Route de Targa Ouzemour, University Campus, Bejaia 06000, Algeria
souhila.mazguene@crtaa.dz

Abstract

Humans need nutrients to survive, essential for good health and strength of the body. However, current biological, social and psychological practices greatly affect people's dietary intake, leading to health-related problems. Situation which forces individuals to take drugs and supplements, with many undesirable secondary effects. In this way, scientists investigate uncountable strategies to solve these complications, and one of the alternatives is fermented foods. About 30% of the human diet consists of fermented foods, consumed in most societies with different cultures and lifestyles. They are cost-effective due to their preparation using available seasonal raw materials from local farming. This type of alimentation, widely distributed, was adopted for thousands of years for its organoleptic and mainly preservative characteristics. The fermentation gives specific sensory proprieties and prolongs shelf life/safety depending on the products and fermenting microorganisms. The most studied category of fermented foods is dairy products. Nowadays, their consumption is motivated by health-related prospects. Increasing evidence of the association of fermented foods with health has further increased their popularity in recent years. Fermented foods are a source of biotics (probiotics, prebiotics, synbiotics, postbiotics and parabiotics), related to various health benefits, from the digestive (assimilation, microbiota equilibrium…) to the immune system modulation. Differences in the microbial consortia present or used have various health effects. Several studies evaluated their anti-inflammatory, anti-microbial, anti-diabetic, anti-oxidative and other effects induced by beneficial components produced during fermentation processes. The adoption of fermentation technology is in progress and many start-ups are created in the West.

Determinants of Poverty Among Rural Farming Households in Ganye Local Government Area of Adamawa State, Nigeria

Yahaya Zira Dia[1], Daniel Stephen Oaya[1]

[1]Department of Agricultural Extension and Management, School of Agriculture and Agricultural Technology, Adamawa State College of Agriculture, Science and Technology, P.M.B. 2088 Ganye, Nigeria

Abstract

Poverty is one of the difficult problems that affect rural farming households in Nigeria because farming is their primary source of income. In Ganye Local Government Area of Adamawa State, Nigeria, the study examined the causes of poverty among rural agricultural households. The particular research objectives were to define the socioeconomic characteristics of the respondents, determine their level of poverty, and investigate the reasons that cause poverty among the respondents. The primary data for the investigations came from 250 respondents who were selected using a multi-stage random selection technique. The analytical techniques used were descriptive analysis, Foster-Greer-Thorbeeke (FGT) and Logit regression model. The study's findings revealed that the majority of rural farming households' heads were men (84.40%), married (85.60%), with a mean age of 41.25 years, educated (84.00%), and with a mean farm size of 2.56 ha and a mean household size of 7 individuals. However, the majority of responders (87.60%) lacked access to credit. The distribution of respondents by level of poverty (P_o, P_1, and P_2) according to the study's findings was also discovered to be 0.60 for incidence, 0.31 for depth, and 0.19 for severity. The Logit regression model's findings demonstrated that while age, marital status, and household size had adverse effects on poverty status among farming households and were statistically significant at different levels, sex, formal education, primary occupation, access to credit, total income, and annual remittances had favorable effects. The study's conclusions recommended that rural farming households have access to centers for skill development, that adequate financing be provided for the development of infrastructure, and that credit facilities be accessible. These suggestions would contribute to reducing poverty.

Key Words: *Determinants, Poverty status, Rural farming household, Logit regression model and Adamawa State*

Introduction

Poverty is widely recognized as a significant indicator of underdevelopment, with its reduction often equated with progress in development or economic advancement. It is a social state characterized by inadequate access to necessities of life (food and non-food) to maintain a minimal level of living that is socially acceptable in a particular society. Ample food, a place to live, access to potable water, health care, education, and employment opportunities are a few of these fundamental well-being determinants. Since most of these facilities are essentially controlled by the market, who possesses what always depends on an individual's income or other disposable resources that are available to households or individuals (Mansi et al., 2020, Henry et al., 2023).. According to Ike and Uzokwe (2015), poverty is defined as a household or individual not having enough income to meet these demands at the bare minimum levels in the society in question. It goes without saying that poverty is a global issue, yet the threat of poverty is most destructive in the developing world. Particularly over the past ten years, the majority of developing countries' human conditions have drastically worsened, real disposable income has significantly decreased, and rates of hunger have increased. The quantity and quality of health have drastically declined, and food production has barely kept up with population growth (Waseem et al. 2020). The extent of poverty among farmworkers and farmers is influenced by the larger society in which they reside. Low levels of assets combined with poor returns lead to poverty. Only their own labor, which is invariably used in laborious, physically taxing, low-paying employment, makes up the majority of the poor's possessions. Poverty perpetuates itself. There is a great likelihood that a poor person or family will remain poor. High disease risks, mobility restrictions, and restricted access to education are all associated with low earnings (Adekoya, 2014).

According to Hagan (2018), poverty results from a lack of assets and low returns. Only their own labor, which is invariably used in laborious, physically taxing, low-paying employment, makes up the majority of the poor's possessions. Poverty perpetuates itself. There is a great likelihood that a poor person or family will remain poor. High disease risks, mobility restrictions, and restricted access to education are all associated with low incomes. When one or more people fall short of the standard of living that is considered to be a fair minimum in terms of economic welfare, whether in an absolute sense or by the standards of a particular society, they are said to be living in poverty (Jude et al., 2020). The prevalence of poverty is rising, along with its consequences for the country as a whole and the rural population in particular. One in five people on the planet are said to be living in abject

poverty. According to Mood and Jonsson (2016), poverty is the inability to effectively meet needs for things like food, shelter, clothes, and Medicare. It is also a condition in which a person, family, community, or country may find themselves lacking in basic necessities. It is a widely multifaceted, partially subjective phenomenon that is frequently seen as both the root of underdevelopment and one of its symptoms. It takes various forms, one of which is the inability of an individual or group to contribute to and thrive in society.

As of 2022, a staggering 712 million people worldwide were living in extreme poverty (defined as less than $2.15 per day, based on the international poverty line). According to the World Bank (2024), extreme poverty continues to be concentrated in regions of Sub-Saharan Africa, areas affected by conflict and fragility, and rural settings. The report emphasizes that addressing poverty comprehensively necessitates addressing its multifaceted dimensions. Furthermore, it highlights that countries cannot effectively combat poverty without simultaneously enhancing the overall well-being of their populations, including through equitable access to healthcare, education, basic infrastructure, and services, as well as digital technologies. Rural poverty is a significant issue globally, with nearly 63 percent of poverty concentrated in rural areas (UN, 2024).

In 2018 over 62.32 million people live in extreme poverty in Nigeria representing about 30.90% of the population (World Bank, 2022). According to the National Bureau of Statistics (NBS, 2020), location and education both have a significant impact on poverty. In Nigeria, poverty is mostly perceived as a rural issue because the majority of residents depend on agriculture for a living. According to IFAD (2007), poverty in Nigeria is generally evenly distributed throughout the nation, but it is particularly bad in some regions, such as the desert northern region bordering Niger. Rural areas have a particularly high level of poverty since there are few or no social services and little infrastructure. Farm and non-farm activities are becoming increasingly important, but little is known about how they fit into rural households' income generating plans in emerging nations like Nigeria (Ibekwe, Onyemawa, Henri-Ukoha, Korie & Nwaiwu, 2010). Even though it is common knowledge that rural households have a propensity to work several jobs, it is important to systematically relate livelihood diversification to programs aimed at reducing rural poverty and ensuring food security.

Statement of the problem

Although poverty is a global problem, its consequences are particularly noticeable in rural South East Asia and sub-Saharan Africa (Uchechi & Okewale 2010). Despite being endowed with natural resources, Nigeria, one of sub-Saharan Africa, continues to experience widespread poverty. This is accurate when one considers that, according to Iheke (2010), 35% of Nigerians live in absolute poverty, with over 70% of the population being categorized as poor. According to Igbuzor (2006), poverty is defined as the inability of a person to obtain basic requirements of life or to live on less than $1 per day. According to Obadan (2001), poverty has numerous manifestations and aspects, including living in unsanitary neighborhoods, being over-indebted, being dependent on money, being unable to exercise one's independence, and being unable to meet one's fundamental requirements. These exert pressure on the physical environment, contributing to the deterioration of the environment.

The effects of poverty on rural households are troubling because these households are more vulnerable to adverse changes in the political, social, economic, and environmental factors that worsen their poverty. Federal Office of Statistics (FOS, 2011) and Iheke (2010) list these factors as being worsened food insecurity, risk-averse behavior to protect the meager resources at hand, low income due to subpar social amenities, and unfavorable government policies. Because rural households are particularly vulnerable to poverty, it is necessary to start programs that will increase their sources of income in order to reduce their poverty. The majority of people in sub-Saharan Africa's rural areas make their living primarily from agriculture, so it is crucial to increase agricultural productivity through the use of advanced technology as well as their capacity to market and distribute their goods in order to increase their income (Uchechi & Okewale 2010). In Nigeria, the poverty headcount rate in 2019 was 40.09%, or 40.1 percent of the country's population. While the squared poverty gap index (severity) is 5.63 and the poverty gap index is 12.85%. In Adamawa state, the poverty headcount was 75.4%1, the poverty gap index was 27.64%, and the squared poverty gap index (severity) was 13.21%; poor families are headed by 82.6% women and 70.9% men, respectively (NBS, 2019).

Objective of the Study

i. describe the socio-economic characteristics of the respondents
ii. determine the poverty status of the respondents in the study area,
iii. examine the determinants of poverty among the respondents

Materials and Methods

Study Area

The study was carried out in Ganye local government areas of Adamawa State (Fig. 1). Ganye local government areas lies between latitude 8º12’- 8º40’North and longitude 11º37’-12º15’ East. It is bounded by Jada to the north, Mayo-belwa to the northwest, Toungo to the south, Taraba state to the west and Cameroon Republic to the east.

Ganye has a land mass of 2,011.47 km2 and a projected population of 240,686. The mean annual temperature of the study area for maximum is 32.3ºC and minimum 19.6ºC while the average annual rainfall total is 1,231 mm with a distinct dry season which begins in November and ends April and the wet season begins in April and ends in October or sometimes in November. The areas are located within the Guinea Savannah zone of the Nigeria's vegetation zones. The major economic activity in the area is agriculture. Food crops grown in the area are maize, sorghum, cowpea, cassava and potatoes. While cash crops such as groundnuts, rice, yam and sugarcane are produced in large quantities. Major livestock reared in the zone are cattle, sheep and goats (Adebayo and Zemba, 2020; Akosim et al., 2020; Kadams et al., 2020; Zemba et al., 2020).

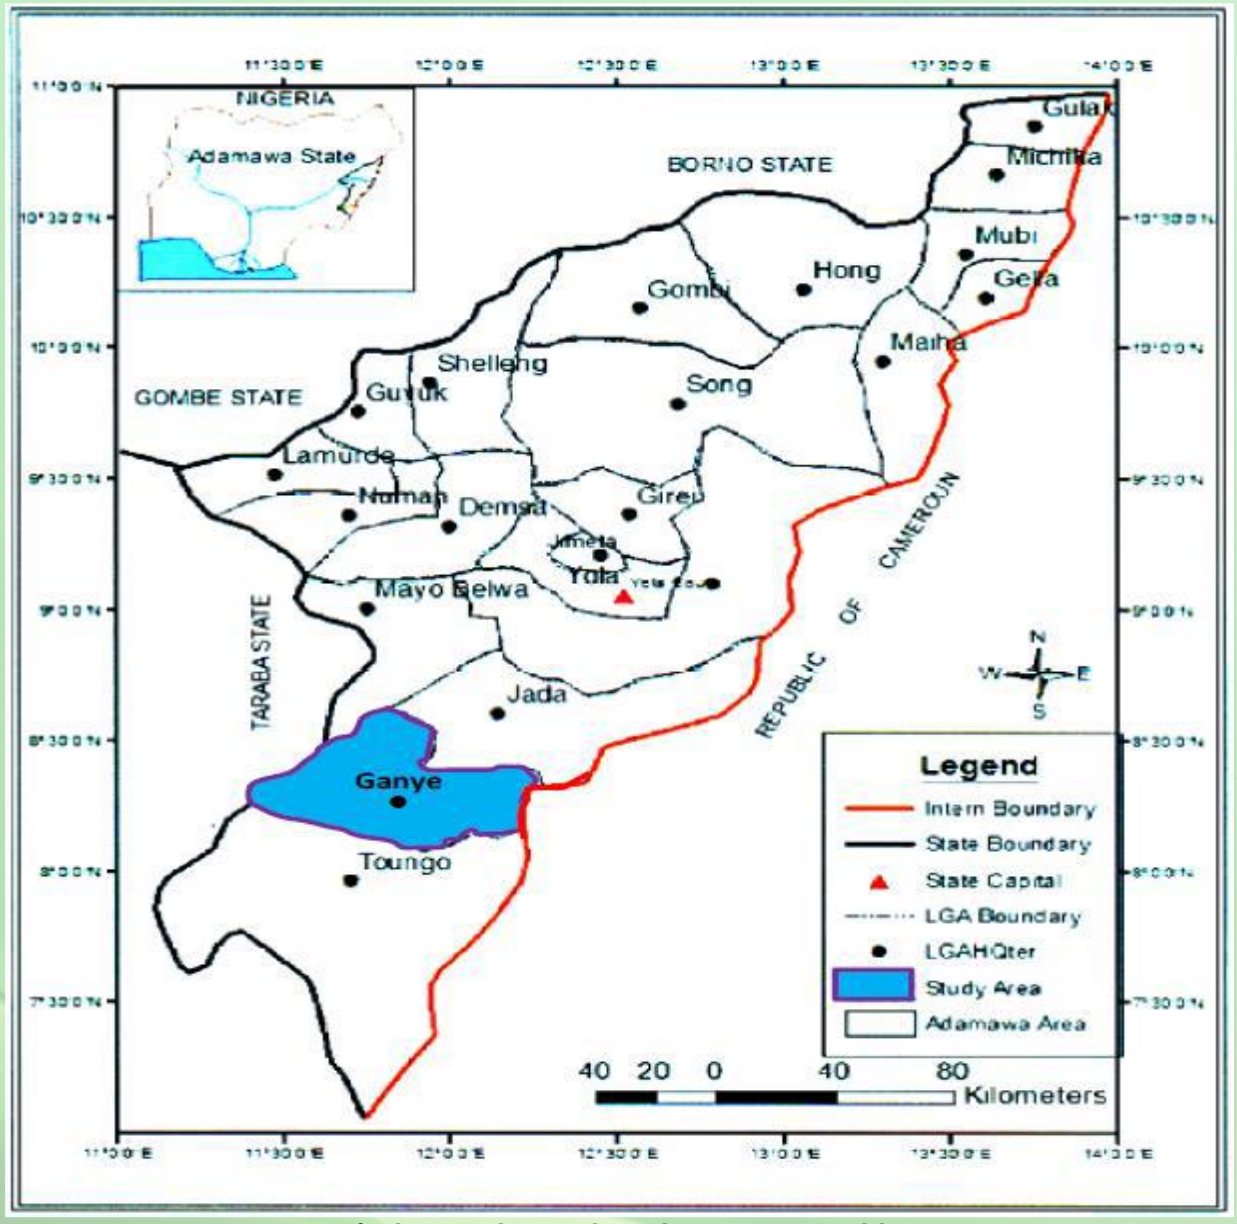

Fig 1:Map of Adamawa Showing the study Area Source: Adebayo, 2020

Sampling procedure and Sampling Size

A multi stage sampling technique was used to collect primary data from 250 rural farming households in the study area using questionnaire, selected from fifteen farming communities namely Santasa, Sangasumi, Sanyigmi, Gamu, Dalebbi, Dimgam, Gurum, Gurum-Novan, Jangani, Kwana-doya, Yebbi, Sugu, Jagg, timdore and Dabirra respectively. The respondents were randomly selected from each community proportionate to the number of the household in each community.

Method of Data Collection

Primary data was gathered from rural homes in the study area using a structured questionnaire and interview schedule.

Analytical Technique

Both descriptive and inferential statistics were used to achieve the research objectives of the study. Descriptive statistics was used to describe the socioeconomic characteristics of the respondents while inferential statistics such as Foster, Greer and Thorbecke (FGT) poverty model to determine their poverty status and Logit regression model was used to determine theeffect of some socio-economic characteristics on poverty.

Foster, Greer and Thorbecke (FGT)Poverty model

One of the methods that was used in the study is the popular FGT measures of poverty. This was used to determine the Poverty Status of the farming households in the study area. The poverty status of the farmers was measured based on their consumption/expenditure from the sources of their livelihood. The consumption/expenditure level that separates the poor from the rest of the population is called the poverty line. The poverty line helps us in classifying the poor and non-poor and then calculates the poverty indices for rural households in the study area. The first step in calculating the consumption/expenditure based index is to assess a level of consumption/expenditure below which an individual is defined as poor: the so-called poverty line. It is well known that if consumption/expenditure is divided into two categories, food consumption/expenditure and non-food consumption/expenditure, the poorer people are, the higher the proportion of their overall expenditure that is accounted for by food consumption/expenditure. In determining consumption/expenditure levels that can be used to separate the poor from the non-poor, food consumption/expenditure is the most significant measure. Thus a food poverty line (a minimum level of food consumption/expenditure) is first calculated. A non-food minimum allowance is then calculated and added to the food poverty line to provide the total poverty line. This poverty line was used to determine the magnitude and intensity of poverty among the farming household in the study area.

The Foster-Greer-Thorbeeke (FGT, 1984) indices was used to measure the magnitude, depth and severity of poverty. The P_α class of poverty according to Foster *et al.* (1984) can be addressed in respect of poverty incidence, ($\alpha = 0$); depth of poverty ($\alpha = 1$); and severity of poverty ($\alpha = 2$), the higher the value of α, the greater the weight given to the severity of poverty. For $\alpha = 0$, FGT reduces to headcount ratio (H) and when $\alpha = 1$, it reduces to poverty gap and if $\alpha = 2$, we have poverty severity index.

Following Greene (2003) as well as Adigun, Bamiro & Adedeji (2015) general class of a poverty measure which combines these three characteristics of poverty can be written as:

$$P_\alpha(y,z) = \frac{1}{n}\sum_{i=1}^{q}\left(\frac{z-y_i}{z}\right)^\alpha \quad (1)$$

Where:

n = Total number of households in a population

q = The number of poor households

z = The poverty line (Naira)

y_i = Household per capita expenditure (Naira)

α = Poverty aversion parameter and takes values, 0, 1, 2

$\left(\frac{z-y_i}{z}\right)$ = Proportionate shortfall in income below the poverty line

α takes on the value 0, 1, 2, to determine the type of poverty index.

When $\alpha = 0$, the expression reduces to

$$P_o = \left(\frac{1}{n}\right)q = \left(\frac{q}{n}\right) \quad (2)$$

Where:

P_o = poverty incidence

n = total number of households in a population

q = the number of poor households

This is referred to as the Headcount Ratio (poverty incidence) describing the proportion of the population that falls below the poverty line. This measure gives equal weight to all poor irrespective of the intensity of their poverty. The headcount ratio has been criticized for focusing only on the number of the poor being insensitive to the severity of poverty and changes below the poverty line. That is, it treats all the poor equally whereas not all the poor are

equally poor. Also, neither a transfer from the less poor to poorer, nor a poor person becoming poorer would register in the index, since the number of the poor would not have changed.
Where $\alpha = 1$, the expression in the equation (equation 1) reduces to:

$$P_1 = \frac{1}{n}\sum_{i=1}^{q}\left(\frac{z - y_i}{z}\right) \quad (3)$$

Where:
P_1 = poverty gap
n = total number of households in a population
q = the number of poor households
z = the poverty line (Naira)
y_i = expenditure of the poor household less than the poverty line (Naira)
And this is called Poverty Gap (depth of poverty) each poor is weighed by his or her distance from the poverty line, relative to z.
Where $\alpha = 2$, the expression now becomes

$$P_2 = \frac{1}{n}\sum_{i=1}^{q}\left(\frac{z - y_i}{z}\right)^2 \quad (4)$$

Where:
P_2 = poverty severity
n = total number of households in a population
q = the number of poor households
z = the poverty line (Naira)
y_i = expenditure of the poor household less than the poverty line (Naira)
Equation (4) is called poverty severity index. In this measure, the weight given to each poor is proportional to the square of his or her income shortfall from the poverty line. This index weighs the poverty of the poorest individual more heavily than those just slightly below poverty line. This measure all the three indicators of the poverty stated above.

Binary Logit Model
The Binary Logit (BNL) Model was employed in this study. In this model, the data on the dependent variable (poverty status) is bi-variate, that is, poor or non-poor. The BNL model was therefore, employed due to the nature of the decision variable. For such a dichotomous outcome, the BNL model is the most appropriate analytical tool (Pur et al. 2016; Benedicta et al. 2010; Kristof, 2009). The implicit form of the model is expressed as:

$$Y = \ln\left(\frac{\emptyset_1}{1-\emptyset_1}\right) = \beta_o + \sum_{j=1}^{k}\beta_j X_{ij} + \varepsilon_i \quad (5)$$

Where:
Y = Dependent variable (i.e, the binary variable; Y = 1 for a household that diversified livelihood activities and Y = 0 for otherwise.
β_o Intercept
β_i = Estimated parameters
X_i = Explanatory variables
i = 1, 2, 3, ------ n number of explanatory variables
ε_i = the matrix of unobserved random effects, $\frac{\emptyset_i}{1-\emptyset_i}$ is "odd", and $ln\left(\frac{\emptyset_i}{1-\emptyset_i}\right)$ is the logarithm of "odds".
Equation (5) can be manipulated to give the odds ratio using equation (6):

$$\frac{\emptyset_i}{1-\emptyset_i} = \exp\left(\beta_0 + \sum_{i=1}^{k}\beta_i X_i\right) \quad (6)$$

The probability of the extent of access was calculated using equation (7):

$$\emptyset_i = \frac{exp\left(\beta_0 + \sum_{i=1}^{k}\beta_j X_{ij}\right)}{1 + exp\left(\beta_0 + \sum_{i=1}^{k}\beta_j X_{ij}\right)} \quad (7)$$

Equation (11) is intrinsically linear since the logit is linear in X_i (Gujarati, 2004); it indicates that probability $\emptyset_i$lies between zero and one and vary non-linearly with X_i. The equation for calculating partial effects of continuous variable is denoted by:

$$\frac{\partial \emptyset_i}{\partial x_i} = \emptyset_i(1-\emptyset)\beta_j \quad (8)$$

The partial effects of the discrete variables will be calculated by taking the difference of the mean probabilities estimated for the respective discrete variable, X_i = 0 and X_i = 1.
The marginal effects measure the expected change in probability of a particular choice being made with respect to a unit change in an explanatory variable (Greene, 2003).

$$Y = \ln\left(\frac{\emptyset_1}{1-\emptyset_1}\right) = \beta_o + \sum_{j=1}^{k} + \beta_1 X_1 + \beta_2 X_2 \ldots\ldots + \beta_{10} X_{10} + \varepsilon_i \quad (9)$$

Y = Dependent variable (i.e, the binary variable; Y = 1 for poor and Y = 0 for non-poor.
The independent variables were defined as follows:

Table 1. Exogenous variables in the binary logit regression to test poverty status

Variable	Measurement	Expected sign
Age (X_1)	In years	±
Sex (X_2)	Binary variable (1=male, 0=otherwise	+
Marital Status (X_3)	Binary variable (1=married, 0 = otherwise)	+

Formal Education (X_5)	Years	±
Primary Occupation (X_6)	Binary (1 = farming, 0 = otherwise)	±
Access to Credit (X_7)	Binary (1= yes, 0 = No)	±
Total Annual Income (X_8)	Naira	+
Annual remittances(X_9)	Naira	+

Results and Discussion

Socio-economic characteristics of the respondents

The socio-economic characteristics of the respondents here is presented in Table 1. Majority 82.80%) of the respondents are less than 50 years of age with the mean age of 41.25 years. The results showed that 89.18% of the household heads were male. The finding also agrees with Micheal et al. (2015) which revealed that there are more male-headed households in rural Nigeria than female-headed households. Majority (85.60%) of the respondents were married. This indicates that married people constitute bulk of household heads in the rural areas. This agrees with Igwe (2013) who reported that married people could imply larger household size with more mouths to feed. This could aggravate poverty. It also shows that majority (84.00%) of the respondents had one form of formal education or the other. The result revealed that majority of the respondents were literate and this can enhance the level of productivity. This agrees with the study conducted by Ume and Ochiake (2016) that education plays a vital role in formal orientation on dessimination of improved farm practices.

The result on household size reveals that, majority (41.20%) were between 6 – 10 people with a mean household of 7 people. This indication implies that a large household size means more responsibility to catter for the need of the family. The results indicate that75.20% of the respondents were engaged in farming as their primary occupation which include both arable cropping and rearing of livestock. This implies that major occupation of most of the household heads in the study area was farming. This finding corroborates with the finding by Odoh and Nwibo (2016) and Dia et al. (2023) who posited that most rural family in Nigeria are engaged in farming as their primary occupation.

The result shows that majority (82.80%) of the respondents had farm size between 1 – 3 hectares with mean farm size of the respondents is about 2.56 hectares. This is an indication that the farmers in the study area are small-scale farmers, hence food production will be in subsistence level. This finding corroborates with the finding o Fadipe at al. (2014) that majority of rural farmers in Nigeria are small-scale farmers who cultivate less than 5 hectares of land. The result indicates that 85.20% of the respondents had between 1 – 20 years farming experience. This indicates that the farming households' heads had farming experience that can help them improve their productivity on the farm by knowing the correct practices. It also revealed that 87.60% have no access to credit facilities. Their lack of access to credit facilities is as a result of them not being in any registered cooperative or farmers association. This study is in agreement with the study conducted by Sekumade and Osundare (2014) who posited that only few in the rural communities in Nigeria had access to credit.

Assessing the Level of Poverty among Rural Farming Households

Analysis of Expenditure of Respondents and Determination of poverty line

The Foster-Greer-Thorbeeke (FGT) class of poverty measures was employed to estimate the poverty status of the rural farming households in the study area. Following the adoption of Foster, Greer and Thorbeeke measures the households' total expenditure was used to determine the households' poverty status. The result presented in Table 2 shows the household food and non-food expenditure, total expenditure, per capita expenditure, mean per capita expenditure and poverty line. The poverty line was constructed as two-third of the mean per capita household expenditure of all households. This approach has been used by many researchers and institutions (Oyakhilomen & Kehinde, 2016; NBS, 2020). Households were then classified into their poverty status based on the poverty line.

Hence, non-poor households were those whose per capita expenditure was above or equal to two-third of the mean per capita expenditure (poverty line) of all households while those households whose per capita expenditure were below two-third of the mean per capita expenditure were classified as poor. Based on this, the poverty line constructed as two-third of the mean per capita expenditure of all the households was N111,032.98. This implies that households whose annual per capita expenditure fell below N111,032.98 were classified as poor while households whose per capita expenditure equalled or above the poverty line was classified as non-poor.

Table 2. Analysis of Expenditure of Respondents and Determination of Poverty Line

Item	Amount (N / Annum)
Household Food Expenditure	69,362,195.00
Household Non-food Expenditure	53,208,640.00
Total Household Expenditure	122, 570, 835.00
Per Capita Household Expenditure $= \frac{Total\ household\ Expenditure}{Number\ of\ household\ members}$	41,637,366.50
Mean Per Capita Household Expenditure (MPCHE)	166,549.47
2/3 MPCHE (Poverty line)	111,032.98

Source: Field Survey, 2024

Poverty Indices of the Rural Farming Households

The values for the poverty measures the poverty incidence (P_o), Poverty gap index (P_1) and Poverty severity (P_2). From Table 3, a relative poverty line of N111,032.98 was established from the annual food and non-food expenditure of the rural farming households. This implies that a household having an average annual expenditure above the N111,032.98 was considered non-poor, those with average annual expenditure between N55,516.49 and N111,032.98 were considered moderately poor while those having annual average expenditure less than N55,516.49 were considered very poor. Thus the result of the poverty incidence (P_o) is 0.60 which indicate about 60% variability in the poverty of farming households were poor which means 62% of the farming household were not poor. That is out of the 250 rural farming households interview 151 of them were poor. This indicates that poverty was not predominant among the rural farming households which might be due to the fact that most of the household heads diversify their livelihood activities to earn more income to meet their daily needs.

The poverty gap index (P_1) results revealed was 0.31 indicating the gap between the poor and poverty line was 31%, therefore the poor will require 31% rise in their per capita expenditure to become non-poor which translate into N34,420.22 increament to the per capital expenditure of the poor. The poverty severity index (P_2) of the rural farming households was 0.19. This indicates that out of 151 poor households interview only 48 of that households were extremely poor. This implies that poverty is severe among poor farming households with about 19% of the farming households constitute the poorest among the respondents. In other words, the squared poverty gap takes into account not only the distance separating the poor from the poverty line, but also the inequality among the poor. The result is similar with the findings of Asogwa et al. (2012) who reported a poverty gap of 0.27 and poverty severity of 0.15 among farming households in Nigeria.

Determinants of Poverty among farming households in the Study Area

A Logit regression was employed to determine the determinants of poverty among farming households in the study area (Table 4). The usual regression diagnostics for the binary logistic regression models were computed to assess the fit of the individual observations. In this study, the result of the goodness of fit test shows that the overall goodness of fit is reflected in a non-significant of Pearson Chi-square p-value which is 0.9822. This implies that the data has a good-fit in explaining the relationship. The model adequacy test shows p-value for hat to be 0.000 which is highly significant and p-value for hatsq is 0.726 which is non-significant. The non-significant of hatsq suggest good model adequacy.

The result showed that The log likelihood function (-60.37) shows that the estimated model including a constant and the set of explanatory variables fit the data better. This implies a better relationship between odds ratio, probability of factors influencing poverty status (dependent variable) and the explanatory variables included in the model collectively contribute significantly to the explanation of farmers' influence in adopting a livelihood diversification strategy. R^2 (coefficient of determination) is 0.6047, suggesting that the model has a good fit to the data. This indicates that 60% of the variation in poverty in the study area is explained by variations in the specified explanatory variables on the changes in poverty among the respondents.

Table 3. Poverty Indices of the Respondents

Poverty Indices	Estimates
Mean Per Capita Household Expenditure	N166,549.47
2/3 Mean Per Capita Household Expenditure (Poverty line)	N111,032.98
1/3 Mean Per Capita Household Expenditure	N55,516.49
Poverty incidence (P_o)	0.60
Poverty depth (P_1)	0.31
Poverty severity (P_2)	0.19
Poor Households	60%
Non Poor Households	40%

Source: Field Survey, 2024

The results logit regression indicates that age (P<0,01), sex (P<0,05), marital status (P<0.10), household size (P<0.05), formal education (P<0.05), primary occupation (P<0.01), access to credit (P<0,05), annual income (P<0.05)) and annual remittances from children and relatives (P<0.01) significantly influence the probability that a household will be poor or non-poor.

The result of age of the household heads was found to have negative effect on the level of poverty and was significant at P<0.01 probability level with marginal effect of 0.8244273. This implies that a unit increase in age of household heads reducees their income by 82%. That is the older the respondents are more likely to become poor compare to their younger counterpart. This supports the theory put forth by Ola-fakuade et al. (2019), according to which the probability of poverty rises with the age of the household heads.

Sex had negative effect on level of poverty with marginal effect of 0.1077759 and was significant at P<0.05 level of probability. This implies that male household heads are 10% more likely to become poor compare to their female counterpart. Because most male household heads shoulder more responsibility than the female from both most culture or society.. This supports the findings of a study by Ike and Uzekwe (2015), which suggested that the majority of rural Nigerian women depend on their male counterparts for productive resources.

Marital status had negative effect on poverty and statistically significant at P<0.01 probability level to poverty with marginal effect of 0.0675921. This results show that monogamous marriage, divorce/separation and widowhood are negatively and significantly by 6% and is correlated with the probability of being poor. This implies that monogamous marriage has probability of reducing poverty polygamous marriage increases poverty. This supports the theory put forth by Anyanwu (2014), who said that monogamous marriage has the best chance of lowering poverty in Nigeria.

The household size had negative with marginal effect of 0.7702981 and was significant at P<0.05 probability level. The indicates that a unit increase in household size increases the likelihood of increasing the poverty level of household by 77%. This is consistent with research by Masood and Nasir (2014) and Adekoya (2014), which suggested that the number of children in a household increases its likelihood of poverty because they are often unproductive and consume a significant amount of household income for things like clothing, food, and school supplies.

Formal education in years have a positive impact to the level of poverty and is significant at P<0.05 level of probability with marginal effect of 1.123572, which implies that a unit increase in level of education will reduce the level of poverty of household by 112%. This is in line with the findings of Ume and Ochiaka (2016), who suggested that education makes people more objective when assessing innovation, which will improve their farm's output and reduce poverty.

Note: *** = Significant at 1%, ** = Significant at 5%, * = Significant at 10%

Primary occupation of the respondents in the study area have a positive effect on poverty and is significant at P<0.01. The marginal effect of primary occupation is 2.979647. This is an indication that the more the respondents engaged in the primary occupation the further away they will be the probability of being poor. This results is consistent with that of Kadurumba et al. (2010), who suggested that household heads' dedication to their primary occupation contributes to the decrease of poverty.

Rural household access to credit is significant at P<0.05 level of probability and has a positive effect poverty status with a marginal effect of 1.407918. This suggests that a unit increase in access to credit by farm household in the study area will increase the probability of the households to escape poverty 130%. This is consistent with research by Oyakhilomen and Kehinde (2016), who found that having access to credit positively affects income diversification, which in turn lowers poverty.

Household total annual income of the respondents in study area in naira was significant at P<0.05 level and has a positive effect on poverty with marginal effect of 1.000008. This implies that as the level of income of the household heads increases the lower will be the probability of being poor by 100%. Duniya and Sanni (2015), who proposed that an increase in revenue from a variety of money-generating activities lowers household poverty, support this finding.

Annual remittance from children and relatives has a positive effect on poverty status and statistically significant P<0.01 with marginal effect of 2.357952. This signifies that a unit increase in remittances of household will reduce the poverty of that household by 235%. This implies that remittances contribute to household income and consequently improved food security status of the households thereby reducing the probability of being poor. This finding is agrees with Odoh and Nwibo (2016) who revealed remittances have a potential multiplier effect, as they are associated with a poverty reduction.

Conclusion and Recommendation

Based on the finding it can be concluded that the level of poverty among farming household, showed that poverty incidence is 0.60 which indicate about 60% in variability of poverty of households of rural farming household within the poor. The poverty gap indicates that the poor will require 31% rise in their expenditure to become non-poor which translate into ₦34,420.22. The poverty severity index of the farming households shows 19% of the farming households that constitute the poorest among the farming household. This implies that poverty is severe among poor farming households. The result of Logit regression model indicates that seven out of the ten independent variables were positively related to poverty status of the respondents, while age, sex, marital status, household size, formal education, primary occupation, access to credit, total annual income and annual remittances were statistically significant at P<0.01, P<0.10, P<0.01, P<0.05, P<0.01, P<0.01, P<0.05, P<0.10 and P<0.05. Based on the finding it was recommended that, there is need for sufficient resources to develop infrastructure which includes roads network, electricity, water and telecommunication for easy evacution of farmers' output to urban area and transportation of inputs into the rural areas. There is a need for the farming households to have access to credit schemes, this could increase the off-farm activities that could generate more income for the household and thereby reduce their poverty.

The Current Role of Turkey (*Meleagris gallopavo*) Breeding in Poultry Production: Türkiye and World Perspectives

Arzu Üçtepe

[1]*Department of Animal Science, Faculty of Agriculture, Isparta University of Applied Sciences, Isparta, Türkiye*

Abstract

This study examines the current role of turkey (*M. gallopavo*) breeding from both Türkiye and world perspectives. Globally, turkey meat production holds significant importance, particularly in the United States and the Europe. While turkeys ranked fourth in the world poultry stock (with shares of ducks, geese, and turkeys at 5.95%, 1.98%, and 0.66%, respectively, in 2023), they ranked second in Türkiye's poultry stock, albeit with a lower share (with shares of turkeys, geese, ducks and guinea fowl at 0.90%, 0.36%, and 0.11%, respectively, in 2023). In Türkiye, certain provinces, especially Manisa, Bolu, and İzmir, stand out in terms of live turkey stocks. In 2024, Şırnak and Van garnered attention by entering the top fifteen provinces in terms of turkey stock. An examination of the import data over the past five years reveals that the maximum level of imports for turkey poults and eggs was achieved in 2020, amounting to approximately 2.9 million units. According to provisional data for 2024, turkey carcass weights have increased by approximately 1.5 kg compared to the previous year, reaching about 11.63 kg, indicating that Türkiye could enter the top ten in the world rankings for turkey carcass yield in 2024. However, over the past decade, per capita turkey meat consumption has not exceeded 1 kg, with 2023 consumption at just 0.557 kg.

Key Words: *M. g. gallopavo, turkey meat, turkey stocks, turkey carcass yield*

Hindi (*Meleagris gallopavo*) Yetiştiriciliğinin Kümes Hayvancılığı Üretimindeki Güncel Rolü: Türkiye ve Dünya Perspektifleri

Özet

Bu çalışma, hindi (*M. gallopavo*) yetiştiriciliğinin mevcut rolünü hem Türkiye hem de dünya perspektifinden incelemektedir. Küresel olarak hindi eti üretimi, özellikle Amerika Birleşik Devletleri ve Avrupa'da büyük önem taşımaktadır. Hindiler, dünya kanatlı hayvan varlığında dördüncü sırada yer alırken (2023 yılında ördeklerin payı %5,95, kazların payı %1,98 ve hindilerin payı %0,66'dır), Türkiye'nin kanatlı hayvan varlığında daha düşük bir payla da olsa ikinci sırada yer almaktadır (2023 yılında hindilerin payı %0,90, kazların payı %0,36 ve ördeklerin payı %0,11'dir). Türkiye'de Manisa, Bolu ve İzmir başta olmak üzere bazı iller canlı hindi varlığı açısından öne çıkmaktadır. 2024 yılında Şırnak ve Van, hindi varlığı bakımından ilk on beş il arasına girerek dikkat çekmiştir.

Son beş yıllık ithalat verileri incelendiğinde, hindi palazı ve yumurtası ithalatının en yüksek seviyeye 2020 yılında ulaştığı ve yaklaşık 2,9 milyon adet olduğu görülmektedir. Geçici verilere göre 2024 yılında hindi karkas ağırlığının bir önceki yıla göre yaklaşık 1,5 kg artarak yaklaşık 11,63 kg'a ulaşması, Türkiye'nin 2024 yılında hindi karkas randımanı açısından dünya sıralamasında ilk ona girebileceğine işaret etmektedir. Bununla birlikte, son on yılda kişi başına hindi eti tüketimi 1 kg'ı geçmemiştir ve 2023 tüketimi sadece 0,557 kg'dır.

Anahtar Kelimeler: *M. g. gallopavo, hindi eti, hindi varlığı, hindi karkas randımanı*

Introduction

The turkey (Meleagris gallopavo), a large bird, belongs to the class Aves, order Galliformes, family Phasianidae, and subfamily Meleagridinae. The recognized subspecies of wild turkeys include *Meleagris gallopavo sylvestris* (Eastern wild turkey), *Meleagris gallopavo aneusta* (Moore's), *Meleagris gallopavo merriami* (Merriam's), *Meleagris gallopavo mexicana* (Gould's), *Meleagris gallopavo gallopavo* (Mexican), *Meleagris gallopavo intermedia* (Rio Grande), and *Meleagris gallopavo asceola* (Shehata and Hafez 2024). The modern domestic turkey is presumed to be descended from the South Mexican wild turkey (*Meleagris gallopavo gallopavo*). The domestication process was initiated approximately 2500 years ago by the indigenous peoples of North America.

The turkey was introduced to Europe in the early 16th century, initially brought to Spain before spreading to other royal households across Europe. Its favorable economic and quality traits have made it a preferred source of meat across various geographic regions globally. Domestic turkeys are selectively bred to be larger than their wild counterparts for meat production (Kyselý and Meduna, 2019; Hristakieva, 2021).

The most pivotal developments in turkey production have occurred in the United States, the United Kingdom, and France. Until the end of World War II, turkeys in the America were historically raised with seasonal breeding and both natural and artificial incubation in free-range systems. The practice of artificial incubation, hybrid breeding, and artificial insemination has facilitated selective breeding aimed at enhancing animal performance and quality (Shehata and Hafez 2024). Turkey production, though smaller compared to broiler production, has seen significant growth since the 1980s, with increasing relevance in both the European Union and the United States (Marchewka et al, 2013). In response to consumer demand, the employment of intensive genetic selection techniques to accelerate growth rates and enhance meat yields has resulted in increased body weight and a higher proportion of breast meat (Hiscock et al., 2022). The breeds listed contain commercial and industrial strains, local types and breeds recognised in many countries. The American Standard of Perfection has identified eight distinct varieties: Beltsville Small White, Black Turkey, Bourbon Red, Bronze, Narragansett, Royal Palm, Slate, and White Holland. Modern domesticated turkeys have been developed through crossbreeding and linebreeding programmes and are recognised as a single breed with eight distinct varieties based on plumage colour (Dahal et al., 2024).

Currently, the leading global specialized breeding companies within the turkey industry include the Erich Wesjohann Group, based in Germany (Aviagen Turkeys), which oversees the B.U.T. and Nicholas lines, and Hendrix Genetics, headquartered in the Netherlands (Hybrid Turkeys), responsible for the Converter and Grade Maker lines. Additionally, these enterprises offer less fast-growing turkey lines, such as various strains from Aviagen Turkeys (Hockenhull Turkeys). Hendrix Genetics, along with the smaller breeding company Kelly Turkeys in the United Kingdom, also provides diverse slow-growing hybrids suitable for free-range production (Kelly Turkey Farms) (Shehata and Hafez 2024).

This study aims to provide a comprehensive overview of the current role and significance of turkey breeding, based on the most recent data, from both a national perspective within Türkiye and a global context.

Turkey breeding in the world

According to the most recently published 2023 data (Fao, 2024), the share of turkey stock in other poultry, its share in slaughtered poultry stock and its share in poultry meat production worldwide are shown in figures 1-3 respectively.

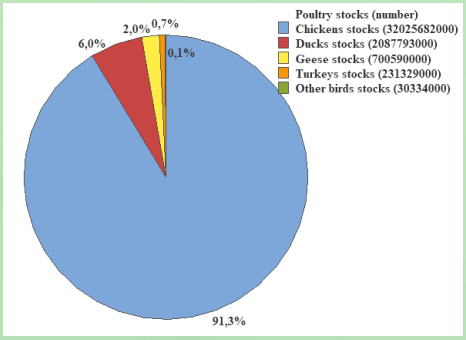

Figure 1. World poultry stock by species in 2023 (Fao, 2024)

In 2023, the world's poultry stock comprises chickens, ducks, geese, turkeys, and other poultry species, accounting for 91.3%, 5.95%, 1.98%, 0.66%, and 0.09%, respectively (Figure 1, Fao, 2024).

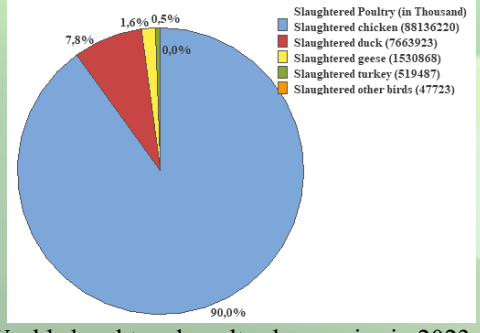

Figure 2. World slaughtered poultry by species in 2023 (Fao, 2024)

Figure 2 illustrates that in 2023, the world poultry slaughter data (expressed in thousands of poultry units) indicates that chickens constitute the highest percentage at 90.03%, followed by ducks at 7.83%, geese at 1.56%, and turkeys at 0.53%. Pigeons and other birds comprise a mere 0.05%, occupying the final position.

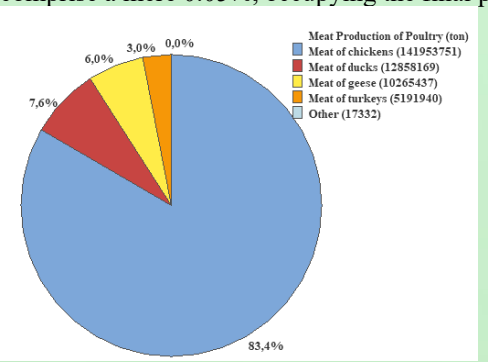

Figure 3. World poultry meat production by species in 2023 (Fao, 2024)

Figure 3 presents the production proportions of poultry meat by species in 2023. The respective percentages for chicken, duck, goose, turkey, pigeon and other birds are 83.36%, 7.55%, 6.03%, 3.05%, and 0.01%.

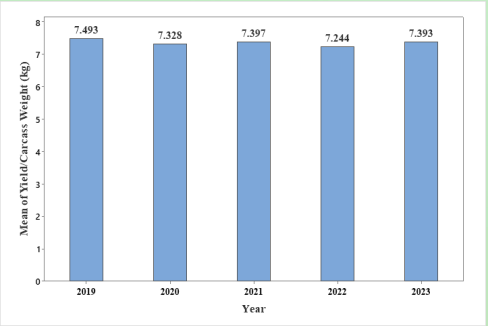

Figure 4. Mean turkey carcass weights in the world in the last five years (Fao, 2024)

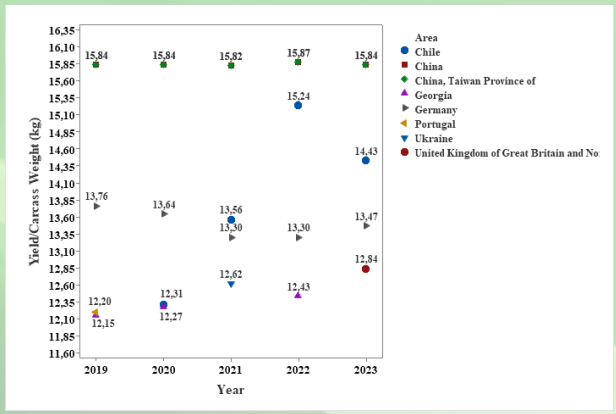
Figure 4 presents the world means of turkey carcass weight over the past five years. Accordingly, the lowest average was recorded in 2022 at 7.244 kg, while the highest was in 2019 at 7.493 kg. Despite these values, there has been no significant numerical fluctuation in the world average over the last five years. On the other hand, Figure 5 shows the leading countries in terms of turkey carcass yield in each year of the last five years (2019-2023). According to this, China and/or China, Taiwan Province is quite high with values above 15 and ranked first every year.



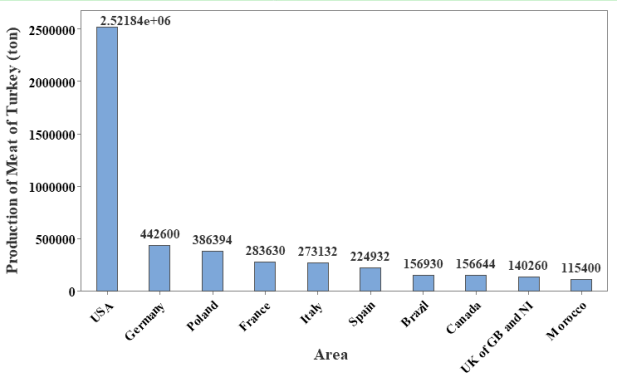


Figure 5. Leading five areas by turkey carcass yield in the last five years (alphabetically listed) (Fao, 2024)

Analyzing the average turkey meat production data from 2019 to 2023 (Figure 6) reveals that the United States of America holds a commanding lead. Following the USA, the top producers are Germany, Poland, France, Italy, Spain, Brazil, Canada, the United Kingdom of Great Britain and Northern Ireland, and Morocco, respectively.

Figures 6. Mean turkey meat production by leading 10 Areas: 2019-2023 (Fao, 2024)

Turkey breeding in Türkiye

Figure 7 presents the turkey stock in Türkiye for the years 2015-2024, along with the shares of other poultry species such as geese, ducks and guinea fowl, which may serve as alternatives to chickens. Despite turkeys ranking behind ducks and geese in the world stock (Figure 1), the proportion of turkey stock in Türkiye ranks second after chickens. While the proportion of turkeys within the poultry stock reached its highest level at 1.302% in 2019, the turkey stock achieved its maximum value (just under 4.8 million) within the last decade in 2020.

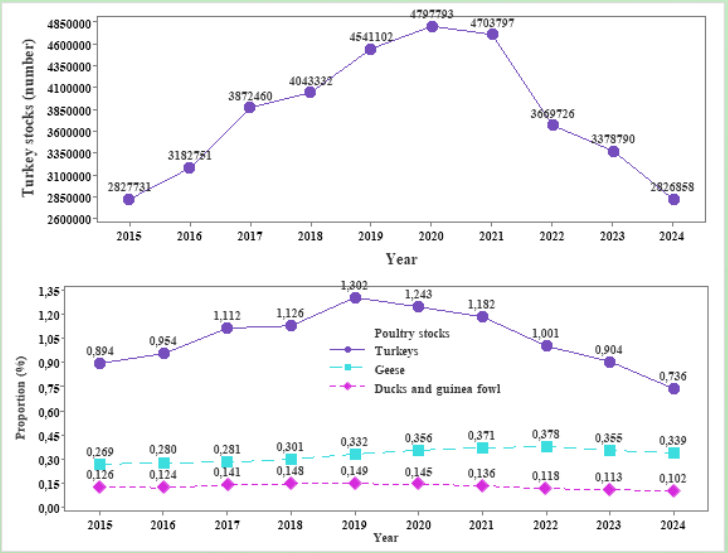

Figure 7. Turkey stock and its proportion within poultry in Türkiye (Tüik, 2024a)

Between 2015 and 2024, the top 15 provinces in terms of live turkey stocks accounted for 76.81%, 79.76%, 82.25%, 83.07%, 84.23%, 85.80%, 85.30%, 82.85%, 82.85%, 82.44%, and 82.46% of the total turkey stocks in these years, respectively (Figure 8, Tüik, 2024a). After 1995, utilizing the existing poultry farming knowledge, turkey farming has developed rapidly, especially in Bolu and İzmir due to the established poultry farming infrastructure (Koyubenbe and Konca, 2010). In the last decade, the live turkey stock in these provinces seems to have maintained its importance. And also, these four provinces, led by Manisa, Bolu, and İzmir, followed by Sakarya, are the leading provinces in terms of turkey stocks and have maintained their importance in the last decade. Except for the years 2018 and 2023, the highest turkey stock was in Manisa, while in these years, Bolu held the top position. In 2018, the proportional shares of Bolu and Manisa were 25.90% and 23.03%, and in 2023, they were very close at 27.70% and 27.64%, respectively. Additionally, in terms of live turkey stock, Şanlıurfa, Diyarbakır, and Muş consistently rank among the top fifteen provinces each year. These provinces represent the regions with the highest volumes of live turkey stocks across the country.

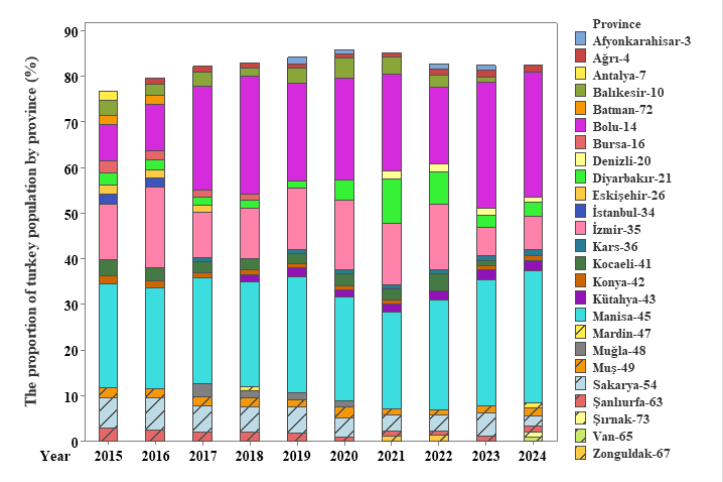

Figure 8. Leading 15 provinces by live turkey ratio over the past decade (alphabetically listed) (Tüik, 2024a)

When examining the provinces with the highest turkey stock ratios (Figure 8), it is observed that Bursa was included from 2015 to 2018, but not after 2019. Additionally, Eskişehir was included from 2015 to 2017, but not after 2018. Kocaeli was included from 2015 to 2023, but not in 2024. Balıkesir was included from 2015 to 2023, but its ranking gradually decreased, and it did not appear in 2024. Although Konya was often at the lower end of the top fifteen, it was included in every year except 2022. In 2024, Şırnak and Van entered the top fifteen for the first time. Although Mardin was in the top fifteen in 2018, it did not reappear until 2024, when it returned as one of the provinces with the highest turkey stock.

Table 1. Türkiye's turkey meat production and consumption (last decade) (Tüik, 2024a)

Year	Slaughtered turkey (thousand)	Turkey meat production (ton)	Yield/ Carcass weight (kg)[a]	Change in carcass yield (%)	Population of Türkiye	Turkey meat consumption per capita (kg)[b]	Chicken meat consumption per capita (kg)[b]
2015	5360	52723	9,836	-	78741053	0,670	24,247
2016	4664	46502	9,970	1,362	79814871	0,583	23,542
2017	5219	52363	10,033	0,632	80810525	0,648	26,441
2018	6780	69536	10,256	2,223	82003882	0,848	26,299
2019	6186	59639	9,641	-5,996	83154997	0,717	25,716
2020	6063	58211	9,601	-0,415	83614362	0,696	25,549
2021	5170	51301	9,923	3,354	84680273	0,606	26,520
2022	5593	53647	9,592	-3,336	85279553	0,629	28,353
2023	4681	47575	10,163	5,953	85372377	0,557	27,278
2024*	3508	40805	11,632	14,454	85664944	-	29,325

*: For the year 2024, data for the last three months of the year are not available, a: Yield or Carcass weight was found by dividing the turkey meat by the number of slaughtered turkeys, b: Per capita consumption is calculated by dividing the total produced meat by the population.

Table 2. Imports of turkey breeder poults and eggs in Türkiye in the last five years (number)

Year	Turkey poults; weight ≤ 185g, breeding stock	Turkey eggs; hatchery, breeding stock	Turkey eggs; hatchery, non-breeding stock	Total turkey egg imports
2020	49075	109200	2804400	2913600
2021	-	160516	1970200	2130716
2022	60830	-	1580400	1580400
2023	82070	-	250000	250000
2024*	66021	-	1909600	1909600

*: Data for 2024 is provisional, (Tüik, 2024b)

Considering that turkeys start laying at about eight months (Özlü et al., 2015), six months laying period (between 31 and 56 weeks of age of the turkey) (Filiz, 2024) and reach slaughter age at about four months (Sipahi and Cevger, 2021), the increase in turkey carcass weight in 2024 (Table 1) can be attributed to increased imports of turkey chicks and eggs in 2022 and 2023. Imported breeding flocks may grow faster, be more productive and have

better nutrition and care than in previous years. However, an examination of the egg import data for the last five years shows that there is no dramatic increase in 2022 and 2023 (Table 2), at least in terms of numbers, and even a numerical decrease until 2023, while turkey poult stocks imports increase in 2023. This increase in carcass yield can be attributed to the use of high-performance genotypes and improved feeding and environmental conditions. On the other hand, turkey carcasses exhibit significant variations based on breed, gender, genetic selection, breeding system, age at slaughter, pre-slaughter treatment (Fry et al., 1962; Çelik et al., 2018). Therefore, the turkey varieties preferred in breeding in 2024 may have exhibited higher performance in terms of carcass yield or longer fattening periods compared to previous years.

In terms of turkey carcass yield, Türkiye has progressively risen in the world rankings from 2019 to 2023, occupying the 23rd, 21st, 17th, 18th, and 16th positions, respectively (Fao, 2024). As shown in Table 1, the carcass yield in 2024 increased by 14.45% compared to the previous year, amounting to approximately 1,5 kg. Consequently, it is projected that Türkiye could enter the top 15 in the world rankings for carcass yield in 2024.

Per capita turkey meat consumption has not even exceeded 1 kg in the last decade. In 2023, per capita turkey meat consumption was only 0.557 kg, whereas chicken meat consumption was approximately 49 times higher, with 27.278 kg consumed per capita (Table 1).

Conclusion

Among poultry species, turkeys have the potential to become a significant meat production sector globally in certain regions. The increase in turkey carcass weight in Türkiye may have been achieved through the application of advanced breeds and modern breeding methods. These advancements suggest that turkey meat production may continue to rise in the future. However, per capita turkey meat consumption in Türkiye remains at low levels.

Gıda Güvenliğini Destekleme ve Sürdürülebilir Tarımı Teşvik Etmede Yabani Yenilebilir Sebzelerin Potansiyel Rolü: Doğu Karadeniz Bölgesi Örneği

Hatice Filiz Boyacı

Bahçe Bitkileri Bölümü, Ziraat Fakültesi, Recep Tayyip Erdoğan Üniversitesi, Rize, Türkiye
Bitki ve Toprak Uygulama ve Araştırma Merkezi, Recep Tayyip Erdoğan Üniversitesi, Rize, Türkiye

Özet

Sebze tarımında giderek artan nüfusun gıda ihtiyacından doğan gıda arz güvenliğini desteklemek için birim alandan daha fazla ürün elde etmeye odaklanılmıştır. Ancak yapılan yoğun tarımsal faaliyetler üretim üzerinde baskı oluşturmuştur. Sebzelerin sürekli aynı ortamda yetiştirilmesinden kaynaklanan toprakların verimsizleşmesi, kimyasal ilaç ve gübrelerin bilinçsiz ve fazla kullanımı, hastalık ve zararlıların yoğunluğu ciddi verim ve kalite kayıplarına neden olmaktadır. Bunlara ilaveten küresel iklim değişikliğinin etkisiyle artan aşırı hava olaylarının yol açtığı yüksek sıcaklık, kuraklık, soğuk, tuzluluk, ani yağışlarla meydana gelen seller, kentleşme ve sanayileşmenin sonucu olarak artan sera gazları salınımı, ağır metaller özellikle açıkta yetiştiriciliği tehdit etmektedir. Bitki ıslahçıları yeni çeşitlerin geliştirilmesinde bir yandan verim ve kalite sorunlarını çözmeye çalışırken diğer yandan stres koşullarına dayanıklılığı artırma çabasındadırlar. Bununla birlikte sürekli değişen koşullarda çoklu strese maruz kalan kültür sebzelerinde stres faktörlerine karşı direnç geliştirmek ıslah sürecini uzatmaktadır. Çoklu dayanım kazandırmak maliyetli bir süreç olup kısa vadede çözüm bulmak zordur. Dayanıklılık genleri için türün yabani akrabalarından yararlanılmakta, ıslah sürecinde yabani genitörden gelen istenmeyen genlerin eleminasyonu uzun zaman almaktadır. Oysa doğada bulunan yabani yenilebilir bitkiler halen güçlü genetik yapıları ile stres koşullarına dayanım sağlamakta ve yaşamlarını sürdürebilmektedirler. Yerelde tüketilen bu bitkiler gıda açığını kapatmada kısa vadede çözüm sunabilmektedir. Ancak bunların doğal yayılış alanlarının vadilerde ve yamaçlarda olması doğadan toplanan bu ürünlerin tedariğini güçleştirmektedir. Yabani yenilebilir sebzelerin kültüre alınarak yetiştirilmesi, devamlı bir şekilde tedarik edilmesini sağlayabilir ve tarımsal üretim sistemlerinde açık kapatılabilir. Türkiye sebze olarak tüketilebilecek yabani yenilebilir türlerin biyoçeşitliliği açısından oldukça zengindir. Yerelde kullanılan bu türlerden kültüre alınma potansiyeli taşıyanlar mevcuttur. Doğu Karadeniz Bölgesi bu anlamda önemli bir örnektir. Yüksek nem ve her mevsim yağışlı, asidik karakterde toprağı olan bölgeye adapte olan bazı yenilebilir yabani yapraklı sebzelerin yüksek adaptasyon yetenekleri ile farklı coğrafik koşullarda da yetiştirilme potansiyeli taşıdıkları kanıtlanmıştır. Bunlar bölgenin sürdürülebilir gıda sistemleri için yerel çözüm sunmakla kalmayıp, gıda güvenliğine alternatif yaklaşım olarak değerlendirilebilir.

Anahtar Kelimeler: *İklime dayanıklı ürünler, biyoçeşitlilik, kültüre alma, yapraklı sebzeler, yerel üretim*

Farklı Işık Spektrumları Köksüz Su Mercimeğinin (Wolffia arrhiza) Morfolojik Yapısını Etkiler

Beyhan Taş[1], Şeyma Palit[2]

[1]Moleküler Biyoloji ve Genetik Bölümü, Fen Edebiyat Fakültesi, Ordu Üniversitesi, Ordu, Türkiye
[2]Moleküler Biyoloji ve Genetik Anabilim Dalı, Fen Bilimleri Enstitüsü, Ordu Üniversitesi, Ordu, Türkiye

Özet

Su mercimekleri (Lemnaceae) beş cins (*Spirodela*, *Lemna*, *Landoltia*, *Wolffia* ve *Wolffiella*) ve 36 türden oluşan, suda serbest yüzen çiçekli bitkilerdir. Dünya'nın en küçük ve en hızlı büyüyen angiospermleri olarak bilinirler. Su mercimekleri 1.5 cm ile 1 mm'den küçük boyutlara kadar değişen türler içerir. Bu ailenin en küçük bireyleri olan köksüz su mercimeği *Wolffia* (su unu, su yumurtaları) yüksek protein içeriği ile dikkat çekmektedir. Bitki bazlı protein kaynağı olarak önemli bir pazar potansiyeline sahip olan *W. arrhiza* ve *W. globosa* üzerine son yıllarda daha fazla odaklanılarak üretimi yapılmadır. Bu çalışmada, iklimlendirme kabininde farklı LED ışıklar altında (beyaz, kırmızı, mavi ve mor) ve laboratuvar ortamında gün ışığında yetiştirilen *W. arrhiza*'nın morfolojik yapısı (en ve boy uzunluğu) incelenmiştir. Stereo mikroskopta yapılan incelemelerde, en ölçümleri sırasıyla mavi > gün ışığı > beyaz > mor > kırmızı ışıklarda, boy ölçümleri ise sırasıyla gün ışığı > mavi > beyaz > mor > kırmızı ışıklarda tespit edilmiştir. Araştırma sonuçlarına göre farklı ışık spektrumlarının *W. arrhiza*'nın morfolojik yapısı üzerinde etkili olduğu gözlenmiştir. Mavi LED altında yetişen *W. arrhiza* daha iri iken kırmızı LED örnekleri daha küçük yapılıdır. Hedefe yönelik (gıda, yem, biyoteknoloji, biyoyakıt, biyolojik arıtma gibi) büyük biyokütleli, verimli, optimum ve sürdürülebilir üretim amacıyla, geleneksel ışıkların yanı sıra LED uygulamaları su mercimeği yetiştiriciliğinde kullanılabilir. Bunun için su mercimeği türlerine uygun ışık tercihinin seçilmesi gerekir.

Anahtar Kelimeler: *Köksüz su mercimeği, Wolffia arrhiza, LED ışık, ışık dalga boyu, bitki büyümesi*

Different Light Spectrums Affect the Morphological Structure of Rootless Duckweed (*Wolffia arrhiza*)

Abstract

Duckweeds (Lemnaceae) are free-floating flowering plants in water, consisting of five genera (*Spirodela*, *Lemna*, *Landoltia*, *Wolffia* and *Wolffiella*) and 36 species. They are known as the smallest and fastest-growing angiosperms on Earth. Duckweeds include species ranging in size from 1.5 cm to less than 1 mm. The smallest members of this family, the rootless duckweed *Wolffia* (watermeal, water eggs), are notable for their high protein content. *W. arrhiza* and *W. globosa*, which have an important market potential as plant-based protein sources, have been more focused on and produced in recent years. In this study, the morphological structure (width and length) of *W. arrhiza* grown under different LED lights (white, red, blue, and violet) in an air conditioning cabinet and under daylight in the laboratory was investigated. In the stereo microscope examinations, the width measurements were determined under blue > daylight > white > violet > red light, and the length measurements were determined under daylight > blue > white > violet > red light, respectively. According to the results of the research, it was observed that different light spectra were effective on the morphological structure of *W. arrhiza*. *W. arrhiza* grown under blue LED were larger, while red LED samples were smaller. For targeted (food, feed, biotechnology, biofuel, biological treatment, etc.) large biomass, efficient, optimal, and sustainable production, LED applications can be used in duckweed cultivation alongside conventional lights. For this, it is necessary to choose the appropriate light preference for duckweed species.

Key Words: *Rootless duckweed, Wolffia arrhiza, LED light, light wavelength, plant growth*

Interfacial Activity and Stabilization Mechanisms of Food Colloids in Pickering Emulsions

Duygu Aslan Türker

Erciyes University, Engineering Faculty, Food Engineering Department, 38039, Kayseri-Türkiye

Abstract

The interfacial deformation and interfacial rheology behavior of food colloids are one of the important factors affecting their emulsification performance. The interfacial layer formed by food colloids adsorbed on the oil-water interface plays an important role in emulsion stability. However, these issues have not yet been sufficiently clarified. Based on the finding that colloidal particles used in food significantly improve the emulsifying property of Pickering emulsions, the effects of food colloids on the structure properties, interfacial deformation, and interfacial rheology behavior and their relationship with emulsification performance were investigated in this study. The results showed that food colloids at the interface of Pickering emulsions promoted the initial adsorption of particles and accelerated the formation of viscoelastic interfacial films, improving emulsification performance. In addition, food colloids imparted moderate viscosity and fluidity to the interfacial layers, which could combat the destabilization caused by oil droplet deformation. This study is believed to provide new insights into understanding and fine-tuning the interfacial behavior of food colloids.

Key Words: *interfacial behavior, food colloids, emulsion stability, Pickering emulsions, O/W interface*

Paraprobiyotiklerin Kısa Zincirli Yağ Asitleri Üretimindeki Rolü: Mikrobiyal Etkileşimler ve Potansiyel Mekanizmalar

Ecem Akan[1], Adem Yavaş[2]

[1]Süt Teknolojisi Bölümü, Ziraat Fakültesi, Aydın Adnan Menderes Üniversitesi, Aydın, Türkiye
[2]Gıda Kalite Kontrolü ve Analizi Programı, Gıda İşleme Bölümü, Çine Meslek Yüksek Okulu, Aydın Adnan Menderes Üniversitesi, Aydın, Türkiye

Özet

Son yıllarda, kısa zincirli yağ asitleri (KZYA) sağlık üzerindeki potansiyel faydalarıyla dikkat çekmekte ve giderek daha fazla araştırılmaktadır. KZYA'lar, bağırsak mikrobiyotası tarafından diyet lifleri ve dirençli nişasta gibi fermente edilebilir karbonhidratların metabolizması sonucu üretilen biyoaktif bileşiklerdir. Başlıca asetat, propiyonat ve bütirattan oluşan bu metabolitler, bağırsak bariyer bütünlüğünün korunması, antiinflamatuar yanıtların düzenlenmesi ve enerji homeostazının sağlanması gibi önemli fizyolojik süreçlere katkıda bulunur. Son dönemde, canlı olmayan probiyotikler olarak tanımlanan paraprobiyotiklerin sağlık üzerindeki etkileri artan bir ilgi görmektedir. Bu derleme, paraprobiyotiklerin bağırsak mikrobiyotasıyla ilişkili KZYA üretimine etkilerini inceleyen mevcut çalışmaları değerlendirmeyi amaçlamaktadır. Araştırmalar paraprobiyotiklerin bağırsak mikrobiyotasının kompozisyonunu modüle ederek belirli bakteri gruplarının aktivitesini değiştirebileceğini ve bunun sonucunda asetat, propiyonat ve bütirat üretimini etkileyebileceğini göstermektedir. Bununla birlikte, paraprobiyotiklerin KZYA üretimi üzerindeki spesifik etkileri; mikroorganizma türü, inaktivasyon yöntemi ve substrat çeşitliliği gibi birçok faktöre bağlıdır. Paraprobiyotiklerin etki mekanizmalarının daha iyi anlaşılması, prebiyotik ve postbiyotiklerle olan etkileşimlerinin araştırılması, gelecekte bu alanda yapılacak çalışmalara önemli katkı sağlayacaktır.

Anahtar kelimeler: *paraprobiyotik, kolonik fermantasyon, bağırsak mikrobiyotası, asetik asit, bütirik asit, propiyonik asit*

Waterlogging Stress in Ornamental Plants, Effects, Tolerance Mechanisms: A rewiew

Ümmü Özgül Karagüzel

Recep Tayyip Erdogan University, Faculty of Agriculture, Department of Horticulture, 53300, Rize, Türkiye

Abstract

In recent years, the frequency and severity of floods have increased due to global warming associated with climate change. Flooding is a significant abiotic stress factor that directly affects plant growth, development, and survival, and it has considerable impacts on biodiversity. In agriculture, research on flooding stress has primarily focused on crops with high strategic importance. However, in ornamental plants, the amount of research remains limited.Flooding induces substantial morphological and physiological changes in plants, depending on the species, the duration of inundation, and the prevailing environmental conditions. The main objectives of this review are to examine the effects of flooding stress on ornamental plants and to highlight the morphological, physiological, biochemical, genetic, and molecular mechanisms involved in flood tolerance.

In recent years, several strategies have been explored to mitigate the adverse effects of flooding on plants. These include the selection of tolerant species and cultivars, nutrient supplementation, hormone treatments, and the application of biostimulants. Such mechanisms support plant survival by enhancing oxygen uptake, reducing toxic metabolite accumulation, and maintaining energy production under hypoxic conditions.

The findings of current studies are crucial for developing strategies to manage flood-induced stress, guiding the selection of suitable ornamental plants for flood-prone landscape areas, promoting sustainable landscape designs, and minimizing economic losses in the ornamental horticulture sector. Furthermore, it is essential for ornamental plant breeding programs to focus on the development of waterlogging-tolerant cultivars.

Key Words: *Water flooding, abiotic stress, species selection, landscape*

Süs Bitkilerinde Su Baskını Stresi, Etkileri, Tolerans Mekanizmaları: Bir inceleme

Özet

Son yıllarda iklim değişikliğinin neden olduğu küresel ısınma ile birlikte su baskınlarının sıklığı ve şiddeti de gittikçe artmaktadır. Su baskını, bitkilerin büyümesi, gelişimi ve hayatta kalmasını doğrudan etkileyen, biyoçeşitlilik üzerinde önemli etkiye sahip olan abiyotik stres faktörlerinden birisidir. Tarımda bu konuda yapılan araştırmalar daha çok stratejik değeri yüksek bitkiler üzerinde yoğunlaşmıştır. Süs bitkilerinde ise daha sınırlı sayıda araştırma mevcuttur. Su baskını bitkinin türüne, su altında kalma süresine ve çevresel koşullara bağlı olarak önemli morfolojik ve fizyolojik değişimlere neden olmaktadır. Bu incelemenin temel amaçları, su baskını stresinin süs bitkilerindeki etkilerini ortaya koyarak morfolojik, fizyolojik, biyokimyasal, genetik ve moleküler tolerans mekanizmalarını ele almaktır. Sel baskını stresinin bitkilerdeki olumsuz etkisini azaltmak için son yıllarda bazı uygulamalar üzerine yoğunlaşılmıştır. Tolerant tür ve çeşit seçimi, bazı besin elementi uygulamaları, hormon ve biyostimulant uygulamaları bunlardan bazılarıdır. Bu mekanizmalar, bitkinin oksijen alımını artırarak, toksik birikimini önleyerek ve enerji üretimini sürdürerek hayatta kalmasını sağlar.Yapılan çalışmalar, sel kaynaklı stresi azaltmaya yönelik stratejilerin geliştirilmesi, sele meyilli peyzaj alanlarında süs bitkilerinin seçimine ilişkin değerli bilgilerin sağlanması, sürdürülebilir peyzaj tasarımlarının geliştirilerek süs bitkileri sektöründeki ekonomik kayıpların azaltılabilmesi bakımından önemlidir. Süs bitkileri yetiştiricileri için de su basmasına dayanıklı çeşitlerin geliştirilmesi gereklidir.

Anahtar Kelimeler: *Su taşkını, abiotic stress, tür seçimi, peyzaj*

Introduction

Waterlogging (flooding) is caused by environmental factors such as heavy rainfall, river overflow, storms, over-irrigation, poor soil drainage, and low soil permeability (Figure 1) (Manghwar et al., 2024). It has become increasingly common in many parts of the world due to global climate change and rapid urbanization (Pan et al., 2025). According to recent data, areas affected by flooding cover approximately 13% of the Earth's surface (Sangiorgio et al., 2020). In 2016, a total of $217 million was spent on flood damage and control in the United States—3.4 times more than the costs associated with droughts (Jia et al., 2021). This trend has had a significant impact on urban ecosystems.In response, sponge city models—an innovative approach to mitigating waterlogging—have been adopted in many countries around the world in recent years (Pan et al., 2025). Examples

include Low Impact Development (LID) in the United States, Sustainable Urban Drainage Systems (SUDS) in France, and Water Sensitive Urban Design (WSUD) in Australia (Ning et al., 2017).

Waterlogging is one of the most critical abiotic stress factors that negatively affect plant growth and development. Flood stress manifests in two primary forms: complete submergence of the plant (both root and shoot), leading to anoxia, and partial submergence affecting only the root zone, resulting in hypoxia (Zhao et al., 2018). This stress directly impacts plant metabolism and survival, causing significant physiological, morphological, and biochemical changes. The extent and nature of these changes depend on the plant species, the duration of inundation, and environmental conditions.Plants develop various resistance mechanisms under waterlogging stress, and understanding these mechanisms is essential for selecting flood-tolerant species and guiding genetic improvement studies (Pan et al., 2025).

Research in this area has largely concentrated on agricultural crops that are vital for human nutrition and health. In contrast, studies focusing on ornamental plants remain limited. Waterlogging stress can severely affect the morphology of leaves, flowers, and stems in ornamental species, thereby reducing their aesthetic and commercial value.

Increasing research on this topic may contribute to the development of flood-tolerant ornamental plants, offering practical solutions for waterlogging problems encountered in landscape design and urban green space planning. This review discusses the morphological, physiological, and biochemical effects of waterlogging on plant growth, yield, and quality, as well as the adaptive mechanisms plants employ in response to this stress.

Fig 1. Causes of waterlogging

A.Physiological, Morphological and Biochemical Effects of Waterlogging on Plant Growth and Development

A.1. Physiological Changes

The earliest physiological response of plants to water accumulation in the soil is stomatal closure.

A.1.1. Stomatal Closure

Under waterlogging conditions, plants perceive the stress signal and respond by closing their stomata to minimize water loss from the leaves. However, this adaptive response also limits carbon dioxide uptake, thereby reducing photosynthesis and negatively affecting plant growth (Ashraf, 2012; Yin et al., 2012; Zhang et al., 2024).

A.1.2. Decrease in Photosynthetic Capacity

When air-filled pores in the soil are occupied by water, gaseous exchange becomes restricted. Oxygen and other essential gases diffuse slowly through water-saturated soils, limiting their availability to both plant roots and soil microorganisms. This impaired gas exchange reduces the plant's photosynthetic efficiency (Sharma et al., 2021; Zhang et al., 2024; Pan et al., 2025).

A.1.3. Oxygen Deficiency (Hypoxia and Anoxia)

During waterlogging, plant roots experience oxygen deficiency. This inhibits aerobic respiration and shifts energy metabolism toward less efficient anaerobic pathways, leading to decreased ATP production. Fermentation processes increase, resulting in the accumulation of byproducts such as CO_2, methane, and volatile fatty acids in the rhizosphere. Additionally, high temperatures can accelerate oxygen depletion in saturated soils (Yavaş et al., 2011; Lindsey et al., 2024). In general, oxygen levels in waterlogged soils fall below critical thresholds for plant growth within approximately 45 to 96 hours (Özcan, 2020).

A.1.4. Decrease in Nutrient Uptake

Under waterlogging conditions, even in tolerant plant species, growth rate, nutrient uptake, and the root-to-shoot ratio are significantly reduced. Oxygen deficiency in the root zone disrupts ion balance by decreasing the uptake of potassium (K^+) relative to sodium (Na^+), and impairs the transport of K^+ to aerial plant parts. Research has shown that the adverse effects of waterlogging are not primarily due to the toxic accumulation of Na^+ or Fe^{2+}, but

rather to reduced concentrations of essential nutrients such as nitrogen (N), phosphorus (P), potassium (K), calcium (Ca), and magnesium (Mg).Denitrification and nutrient leaching are key processes that decrease soil nitrogen availability under anaerobic conditions. Denitrification refers to the microbial conversion of nitrite (NO_2^-) or nitrate (NO_3^-) into gaseous nitrogen (N_2) compounds, which are released into the atmosphere, thereby leading to nitrogen deficiency in the soil. In response to nutrient scarcity, plants may remobilize internal nutrient reserves by degrading chlorophyll (Chl), which can impair chlorophyll biosynthesis. This disruption promotes the generation of reactive oxygen species (ROS), ultimately resulting in oxidative damage and cell death (Kudoh and Sonoike, 2002; Yavaş et al., 2011; Ashraf, 2012; Akhtar and Nazir, 2013). Soil pH generally increases during waterlogging, primarily due to the dissolution of carbonate (CO_3^{2-}) and bicarbonate (HCO_3^-) compounds. In saline soils, this condition can exacerbate salt stress, often leading to rapid plant death under prolonged water accumulation (Yavaş et al., 2011; Panda and Barik, 2021).

A.2.Morphological Changes

A.2.1.Root Rot

In the absence of oxygen, root growth is restricted, and processes such as root elongation, thickening, and lateral root formation are either slowed or completely inhibited. Oxygen deficiency leads to the accumulation of toxic compounds such as ethanol and acetaldehyde, as well as mineral ions like nitrites and ferrous ions in root tissues (Sharma et al., 2021; Liu et al., 2021; Pan et al., 2025). These accumulations can cause root cell death and initiate tissue decay processes (Pan et al., 2025). The resulting damage impairs the plant's ability to absorb water and nutrients, ultimately leading to plant death.

Under saline conditions, waterlogging further exacerbates stress by inhibiting the root's ability to exclude salts. This leads to excessive salt uptake and accumulation in the shoots, intensifying toxicity and physiological damage. Waterlogging responses and subsequent recovery strategies in *Paeonia* species are illustrated in Figure 2 (Zhou et al., 2024).

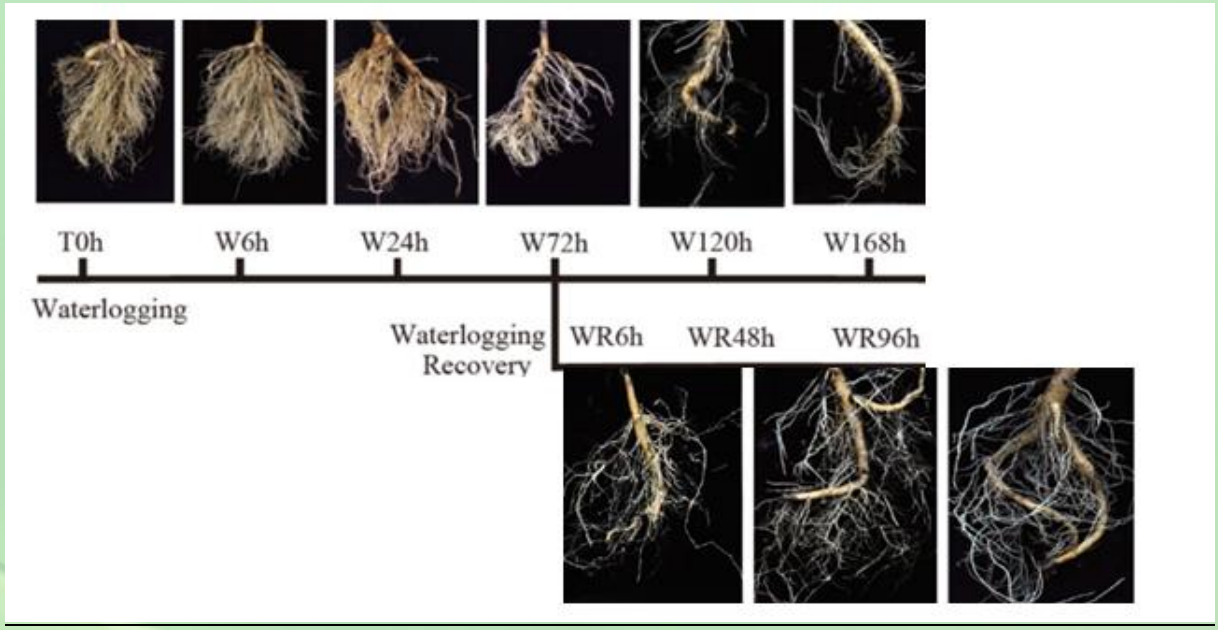

Fig 2. Waterlogging and recovery application in peony plants (Zhou et al., 2024-changed)

A.2.2.Growth Retardation and Decrease of Flowering

Under prolonged flooding conditions, the above-ground parts of plants are also adversely affected. Stem thickening, growth inhibition, or excessive elongation may occur as physiological responses to stress (Pan et al., 2025). In a study on narrow-leaved zinnia (*Zinnia angustifolia*), plants exposed to flooding exhibited significantly reduced height compared to the control plants; however, they retained a high ornamental value. Such morphological responses may represent an adaptive mechanism to reduce flooding-induced damage (Yang et al., 2020).Flooding stress also impacts reproductive development. Flowering may be delayed, reduced, or completely suppressed as the plant prioritizes energy conservation over reproduction (Butsayawarabat et al., 2019; Jacob and Sumiya, 2022).

A.2.3. Leaf Yellowing and Dropping

Due to chlorophyll degradation, plants subjected to waterlogging often exhibit visible symptoms such as yellowing, wilting, and leaf curling. In addition, increased ethylene production under stress conditions may lead to premature leaf abscission and inhibit the formation of new leaves (Zhao et al., 2018; Zhang et al., 2023).

In chrysanthemum (*Chrysanthemum morifolium*), prolonged exposure to waterlogged conditions significantly increased the thickness of palisade and spongy parenchyma layers (Yin et al., 2012). However, in *Celosia spp.* and

Amaranthus spp.—commonly referred to as medallion flowers—leaf thickness was found to decrease under water-saturated conditions (Yang et al., 2020).Short-term waterlogging did not significantly affect the plant height, leaf length, or leaf area of the herbaceous peony (*Paeonia lactiflora*), but it did significantly reduce the root-to-shoot ratio (Liu et al., 2021).

A.3.Biochemical Changes

A.3.1.Increase in Reactive Oxygen Species (ROS)

Under waterlogging stress, oxygen deficiency leads to elevated levels of reactive oxygen species (ROS), which disrupt various cellular metabolic processes in plants. Molecular oxygen is gradually reduced within the cell, resulting in the formation of different types of ROS. These include singlet oxygen ($^1O_2$), superoxide anion (O_2^-), hydrogen peroxide (H_2O_2), and hydroxyl radical (OH•). Under normal physiological conditions, the concentrations of these reactive species are tightly regulated and remain at low levels (Büyük et al., 2012).

ROS are produced in plants even under non-stress conditions; however, their accumulation is limited by enzymatic and non-enzymatic antioxidant defense systems that maintain cellular redox homeostasis. Under stress conditions such as waterlogging, the efficiency of these antioxidant systems declines, thereby promoting ROS overproduction and leading to their accumulation within plant tissues (Yin et al., 2009; Ashraf, 2012).

A.3.2.Increase in Lipid Peroxidation

Lipid peroxidation in plants is promoted by reactive oxygen species (ROS), leading to elevated levels of oxidative damage. Increased lipid peroxidation compromises cell membrane integrity, impairs photosynthetic activity, and reduces overall stress tolerance. One of the key byproducts of lipid peroxidation, malondialdehyde (MDA), can bind to proteins and DNA, thereby disrupting their structural and functional integrity (Liu et al., 2021).Zhou et al. (2019) reported that, under waterlogging conditions, leaf pigment content decreased in all tested poplar cultivars, while the levels of MDA and proline (Pro) increased. Similarly, in a comparative study of flood-susceptible and flood-tolerant chrysanthemum cultivars, MDA content was significantly higher in the susceptible cultivar, whereas it remained relatively stable in the tolerant one (Yin et al., 2009). Elevated MDA levels are considered indicative of weaker antioxidant defense systems and higher oxidative stress (Zhang et al., 2019).

A.3.3.Protein Oxidation and Impairment of Enzyme Activity

Protein oxidation occurs as a result of damage caused by reactive oxygen species (ROS), such as superoxide anion (O_2^-) and hydrogen peroxide (H_2O_2), which alter the structure and function of proteins. This oxidative damage impairs enzymatic activity, thereby disrupting key biochemical reactions. When photosynthetic enzymes are affected, energy production through photosynthesis is significantly reduced.

Under conditions of severe oxidative stress, the accumulation of oxidized or misfolded proteins can trigger the activation of programmed cell death (PCD) pathways, ultimately leading to plant cell death (Manghwar et al., 2024; Pan et al., 2025).

A.4. Hormonal Changes

Ethylene is a phytohormone that promotes plant growth at low concentrations. Under stress conditions, ethylene levels generally increase due to the accumulation of 1-aminocyclopropane-1-carboxylic acid (ACC), a key precursor in the ethylene biosynthetic pathway. ACC accumulation is thought to negatively affect plant growth, particularly by inhibiting root development (Nadaem et al., 2014). Elevated ethylene production can lead to premature leaf abscission and contribute to root damage under hypoxic stress.

In a study conducted on two waterlogging-tolerant *Chrysanthemum* (syn. *Dendranthema spp.*) cultivars, ethylene was reported to accelerate the onset of programmed cell death (PCD) under waterlogged conditions (Yin et al., 2013). Waterlogging also elevates abscisic acid (ABA) levels, which induces stomatal closure to minimize transpirational water loss (Akhtar and Nazir, 2013). Conversely, the levels of growth-promoting hormones such as gibberellic acid (GA_3) and cytokinins are typically reduced under waterlogged conditions (Sanghera and Jamwal, 2019).

B.Mechanisms of Plant Resistance to Waterlogging

The ability of plants to survive waterlogging is associated with their developed resistance to the stress factor, which consists of morphological, physiological, biochemical, genetic, and molecular tolerance mechanisms (Figure 3).

B.1. Morphological and Anatonomical Adaptation

Morphological and anatomical adaptations developed by plants in response to waterlogging include the formation of aerenchyma tissue, adventitious root development, internode elongation, gas film formation, and the development of radial oxygen loss (ROL) barriers. These adaptations help reduce oxygen demand and improve gas exchange under hypoxic conditions.

B.1.1. Elongation of Apical Meristems

Rapid internode elongation is a key adaptation to waterlogging, enabling plants to escape the anoxic zone by reaching above the water surface and restoring access to atmospheric oxygen for aerobic respiration (Pan et al., 2021).

B.1.2. Formation of Aerenchyma

Under waterlogged conditions, some plants develop specialized air-filled tissues called aerenchyma in their roots and stems to facilitate internal oxygen transport (Akhtar and Nazir, 2013; Zhang et al., 2023; Pan et al., 2025). Aerenchyma channels deliver oxygen to the root system while simultaneously allowing the removal of CO_2 and toxic metabolites from water-saturated tissues (Pan et al., 2021).

B.1.3. Adventitous Root Growth

Plants exposed to flooding often form adventitious roots along the stem to enhance oxygen uptake. This response is especially prominent in aquatic and semi-aquatic species and helps compensate for impaired function of the primary root system (Ashraf, 2012; Pan et al., 2025). The formation of adventitious roots is influenced by factors such as water depth, oxygen availability, light penetration, and dissolved CO_2 concentration (Sharma et al., 2021).

B.1.4. Gas Film Formation

In certain aquatic or semi-aquatic plants, a thin gas film forms on the leaf surface under submerged conditions (Figure 4). This gas film facilitates more efficient gas exchange between the plant and its environment, thereby supporting continued aerobic respiration and photosynthesis (Pan et al., 2021).

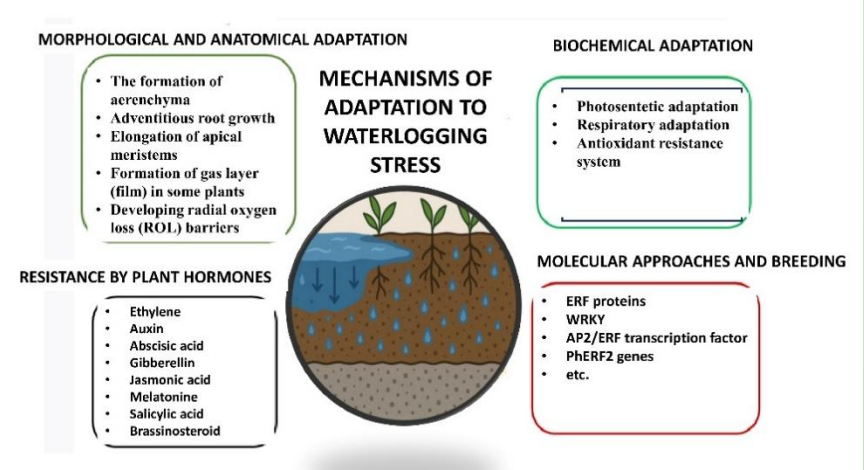

Fig 3. Mechanisms of resistance developed by plants against waterlogging stress

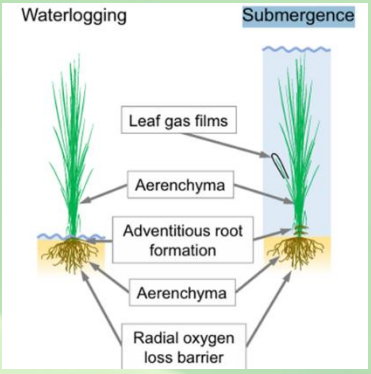

Fig 4. Gas film formation in submergence plants (Kuroha and Ashikari, 2020)

B.1.5. Developing radial oxygen loss (ROL) barriers

Oxygen produced in the leaves—the primary site of photosynthesis—is transported to the roots via specialized air-filled tissues known as **aerenchyma**. Upon reaching the root tip or other root zones, this oxygen can diffuse radially from the root into the surrounding environment. This process, termed **radial oxygen loss (ROL)**, occurs especially in hypoxic or anoxic soils where oxygen is scarce.

ROL can offer several physiological benefits. It creates an oxygenated zone around the root surface, which reduces the toxicity of harmful substances such as reduced sulfur compounds (e.g., hydrogen sulfide) and supports the survival of beneficial aerobic microorganisms (Figure 5). However, when significant amounts of oxygen are lost to the environment before reaching the root tip, it can result in oxygen deficiency at the root apex, thereby limiting root growth. To mitigate this, some plant species develop a physical barrier composed of substances like **suberin**

or **lignin** within the outer layers of the root. This barrier restricts radial oxygen leakage, allowing more oxygen to reach the root tip and enhancing root survival and growth under flooded conditions (Pan et al., 2021).

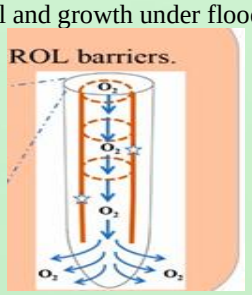

Fig 5. Radial O_2 loss (ROL) (Jia et al., 2021).

B.2.Biochemical Adaptation

Biochemical adaptations under waterlogging stress include the activation of protective enzymes that detoxify harmful substances and support essential metabolic functions, enabling plant survival in oxygen-deprived environments.

B.2.1.Photosynthetic Adaptation

Photosynthetic adaptation refers to the plant's ability to adjust its photosynthetic processes in response to environmental variables such as light intensity, water availability, temperature, and CO_2 concentration. These adaptations help plants maintain energy production under stress conditions.

Photosynthetic pigments—chlorophyll a, chlorophyll b, total chlorophyll (a+b), and carotenoids—play a crucial role in light absorption, and changes in their concentrations directly influence photosynthetic efficiency. The enzyme **Rubisco** (*ribulose-1,5-bisphosphate carboxylase/oxygenase*) is central to the carbon fixation process in photosynthesis. Under flooding conditions, Rubisco activity typically declines, impairing photosynthetic performance. Therefore, maintaining or enhancing Rubisco activity is essential for sustaining carbon assimilation during waterlogging (Pan et al., 2021).

B.2.2. Respiratory Adaptation

Under waterlogging stress, reduced oxygen availability inhibits mitochondrial respiration and leads to a significant decline in **a**denosine triphosphate (ATP) production. To compensate, plants increase anaerobic metabolic pathways such as glycolysis and ethanol fermentation to meet the minimal ATP requirements for cellular maintenance.In the absence of oxygen, the activities of enzymes such as pyruvate decarboxylase (PDC), alcohol dehydrogenase (ADH), and lactate dehydrogenase (LDH) are upregulated to support continued ATP synthesis. PDC catalyzes the initial step in fermentation, converting pyruvate into acetaldehyde, which is then further processed to ethanol by ADH.It converts pyruvate into acetaldehyde. Afterwards Alcohol dehydrogenase (ADH) then converts acetaldehyde to ethanol (Pyruvate $\xrightarrow{PDC}$ Acetaldeyde $\xrightarrow{ADH}$ Ethanol) (Figure 6). This conversion regenerates **NAD^+**, allowing glycolysis to proceed under anaerobic conditions and enabling the cell to continue producing limited amounts of ATP (Pan et al., 2021). While aerobic respiration yields approximately 36 ATP molecules per one molecule of glucose, only 2 ATP molecules are generated through anaerobic fermentation pathways. Despite this low energy yield, it is crucial for maintaining essential metabolic functions and ensuring the short-term survival of the plant under waterlogged conditions (Lamsfus-Prieto et al., 2016; Aslam et al., 2023).

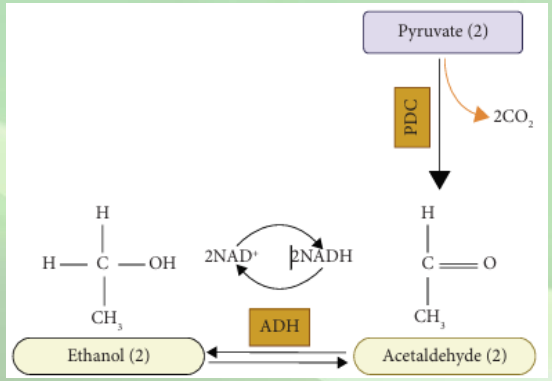

Fig 6. Metabolic pathway of ethanol metabolism in waterlogging (PDC: pyruvate decarboxylase; ADH: alcohol dehydrogenase) (Ali et al., 2023).

B.2.3.Antioxidant Resistance System

Under waterlogging stress, plants activate their antioxidant defense system to prevent cellular damage caused by the accumulation of reactive oxygen species (ROS). This system comprises both enzymatic and non-enzymatic components. Enzymatic antioxidants include superoxide dismutase (SOD), catalase (CAT), peroxidase (POD),

ascorbate peroxidase (APX), dehydroascorbate reductase (DHAR), monodehydroascorbate reductase (MDHAR), and glutathione reductase (GR). Non-enzymatic antioxidants consist of ascorbic acid (AA), glutathione (GSH), tocopherols (lipid-soluble), and carotenoids (Figure 7) (Manghwar et al., 2024).In addition, plants accumulate osmoprotectants such as proline, soluble sugars, free amino acids, and soluble proteins to counteract the toxic effects of waterlogging (Aslam et al., 2023). Yin et al. (2009) compared the physiological and biochemical responses of flood-tolerant and flood-sensitive *Chrysanthemum* cultivars under waterlogging stress. They reported that the activities of alcohol dehydrogenase (ADH), pyruvate decarboxylase (PDC), and lactate dehydrogenase (LDH) increased in both cultivars, with a greater increase observed in the flood-sensitive one. In contrast, the activities of SOD, APX, and POD were significantly higher in the flood-tolerant cultivar, indicating a more effective antioxidant defense system.

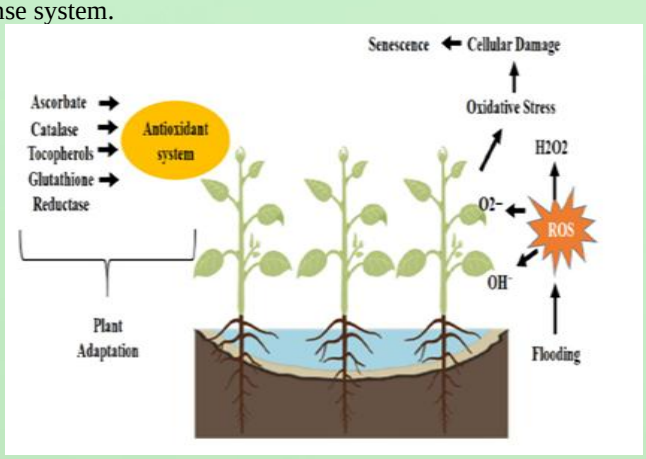

Fig 7. Reactive oxygen species (ROS) production and antioxidant enzyme activity under waterlogging conditions (Nasrullah Ali et al., 2022).

B.3. Resistance Mechanism Induced by Plant Hormones or Biostimulants

Plant hormones, which play key roles in growth and development, also contribute significantly to waterlogging tolerance. A schematic representation of the effects of plant growth regulators under waterlogging conditions is provided in Figure 8.

Ethylene accumulates under waterlogging stress but also regulates several physiological processes that facilitate adaptation. For instance, its interaction with auxin (IAA) promotes the formation of adventitious roots (ARs) (Aslam et al., 2023). Although waterlogging leads to substantial carbohydrate consumption and energy deficiency, light-supported photosynthesis continues to supply sugars that assist auxin transport and AR formation in the hypocotyl (Pan et al., 2021). Furthermore, ethylene interacts with gibberellin (GA_3) to stimulate stem elongation in wetland species (Pan et al., 2025). In a study on different soybean genotypes, GA content was found to be higher in waterlogging-tolerant lines compared to sensitive ones (Pan et al., 2021).

Abscisic acid (ABA) levels increase under waterlogging, activating the antioxidant defense system and inducing stomatal closure. This helps reduce oxidative damage, delay senescence, and enhance waterlogging tolerance. However, in plants exposed to prolonged submergence, ABA levels tend to decrease due to elevated gibberellin activity (Pan et al., 2021).

Although research on melatonin and flood stress is still limited, existing studies indicate that melatonin can enhance tolerance by stimulating antioxidant enzyme activity, reducing ROS levels, and supporting normal growth (Huo et al., 2022). Melatonin application has also been shown to mitigate the effects of anaerobic respiration and reduce MDA and ROS-induced chlorosis (Pan et al., 2021).

Brassinosteroids (BRs) are plant-derived steroids that enhance tolerance to waterlogging by promoting the translocation of carbohydrates from leaves to roots, increasing antioxidant enzyme activity, and reducing ROS production (Pan et al., 2021).

Salicylic acid (SA), a common phenolic compound, enhances plant adaptation to stress by modulating antioxidant pathways (Pan et al., 2021). These hormones reduce ROS accumulation, regulate proline levels, and improve stress tolerance (Hasanuzzaman et al., 2022).

Jasmonic acid (JA) is another growth regulator; however, its role in waterlogging tolerance is less well understood. In a study conducted on soybean, JA application improved flood tolerance by increasing phenolic compounds, flavonoids, and sugar content (Manghwar et al., 2024).

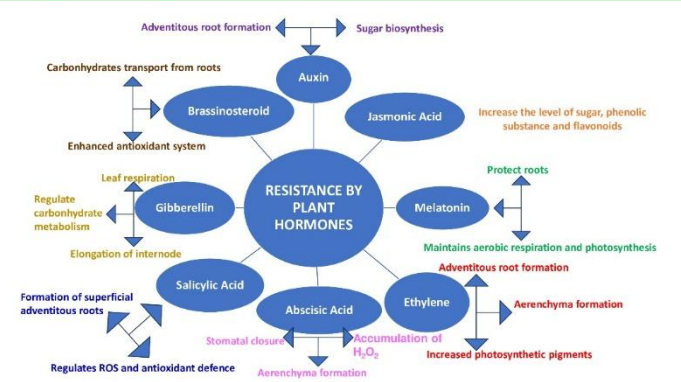

Fig 8. Schematic representation of hormonal resistance mechanisms in plants against waterlogging stress (Manghwar et al., 2024- changed)

B.4.Molecular approaches and breeding

In recent years, molecular techniques have increasingly been employed to assess plant tolerance to abiotic stress factors. The identification of novel genes and proteins is crucial for understanding plant responses to waterlogging stress (Manghwar et al., 2024). Genes associated with flood tolerance can be utilized in genetic modification, gene silencing, and overexpression strategies, thereby forming the basis for molecular breeding programs aimed at improving flood tolerance in horticultural crops (Pan et al., 2025).

Numerous studies have demonstrated that various genes exhibit significant responses to waterlogging stress. For instance, ethylene response factor (ERF) proteins play a critical role in regulating plant responses to environmental stresses. Additionally, the WRKY transcription factor family, one of the largest families in plants, has been shown to be involved in both biotic and abiotic stress responses.

Although chrysanthemum (*Chrysanthemum spp.*) is one of the most economically important ornamental plants, it is relatively sensitive to waterlogging. As a result, it has become one of the most extensively studied ornamental species with regard to flooding tolerance. Several transcription factors and genes, particularly from the AP2/ERF family, have been implicated in waterlogging response pathways in chrysanthemum. In another genetic study, the SOS1 gene was shown to enhance waterlogging tolerance in chrysanthemum (Manghwar et al., 2024).

Furthermore, Su et al. identified single nucleotide polymorphism (SNP) loci associated with waterlogging tolerance in chrysanthemum and developed derived cleaved amplified polymorphic sequences (dCAPS) markers based on PCR technology for SNP detection (Pan et al., 2025).

In petunia, plants carrying the PhERF2 gene demonstrated increased flooding tolerance and faster recovery following submergence (Yin et al., 2019). Other ornamental species that have been investigated for their waterlogging tolerance mechanisms include *Prunus cerasifera*, *Populus* spp., *Iris pseudacorus*, *Begonia* spp., and *Tropaeolum majus* (Pan et al., 2025).

There is a great need to develop flood-tolerant plant varieties, especially in the face of increasing instances of waterlogging stress (Sharma et al., 2021). Recent advances include the development of two double haploid line (DHL) populations through crosses between submergence-tolerant and submergence-sensitive rice cultivars (Ahmad et al., 2013). These DHL populations offer valuable genetic material for identifying loci associated with flood tolerance and accelerating breeding efforts through molecular and classical selection approaches.

C. Researches on Ornamental Plants Againist Waterlogging and Applications in Urban Landscape

Flood stress primarily affects landscape plants by reducing their ornamental value. Pan et al. (2025) identified 50 flood-tolerant plant species with high ornamental potential, including 27 herbaceous plants (*Alternanthera philoxeroides, Hedychium coronarium, Hydrocotyle verticillata, Ophiopogon bodinieri, Dianella ensifolia, Phormium tenax, Zinnia angustifolia, Echeveria cuspidata, Cladium mariscus, Carex secta, Schenoplectus scirpoides, Melilotus sulcatus, Melilotus indicus, Sesbania virgata, Iris tectorum, Stachys byzantina, Salvia officinalis, Thamnochortus insignis, Scirpus tabernaemontani, Angelonia salicariifolia, Zizania latifolia, Phragmites mauritianus, Fimbristylis sinensis, Elymus nutans, Typha orientalis, Canna spp., Alpinia zerumbet*), 7 shrubs (*Ruellia brittoniana, Calotropis procera, Cistus creticus, Jatropha curcas, Pteris ensiformis, Lavandula angustifolia, Myricaria laxiflora*), and 15 tree species (*Alnus spp., Casuarina obesa, Leucaena leucocephala, Dalbergia odorifera, Acacia auriculiformis, Dalbergia sissoo, Pterocarya stenoptera, Ficus altissima, Eucalyptus camaldulensis, Cleistocalyx operculatus, Prunus padus, Prunus cerasus, Populus alba, Populus deltoides, Tamarix chinensis*).

Yang et al. (2020) applied 10 days of waterlogging followed by 7 days of recovery to *Zinnia angustifolia*, *Angelonia salicariifolia*, *Celosia argentea*, and *Melampodium paludosum*. The effects of control and waterlogging treatments on these species are illustrated in Figure 9.

Fig 9. Effects of waterlogging on the performances of *Angelonia salicaliifolia*, *Zinnia angustifolia*, *Celosia argentea* and *Melampodium paludosum* plants. CK: Control WL: Well irrigated condition (60%soil moisture) (Yang et al., 2020).

Plants were subjected to 36 days of waterlogging followed by 12 days of recovery in a study comparing waterlogging-tolerant (*Sedum spectabile* 'Carl') and waterlogging-sensitive (*Sedum spectabile* 'Rosenteller') cultivars (Figure 10).In conclusion, *S. spectabile* 'Carl' demonstrated the ability to withstand waterlogging stress for up to 36 days and exhibited a superior recovery capacity following soil drainage when compared to *S. spectabile* 'Rosenteller'. The ability to form adventitious roots significantly contributed to recovery after stress and adaptation to prolonged waterlogging.Additionally, researchers reported that the improved waterlogging tolerance of *S. spectabile* 'Carl' may be closely associated with a more effective antioxidant enzyme system, including superoxide dismutase (SOD), catalase (CAT), and ascorbate peroxidase (APX), which help to mitigate oxidative stress caused by ROS (Zhang et al., 2019).

Fig 10. Morphological responses of waterlogging-tolerant *Sedum spectabile* 'Carl' and susceptible *S. spectabile* 'Rosenteller' cultivars. Water saturated for 0, 7, 14, 21, 28 and 36 days and *S. spectabile* 'Carl' treated for 12 days (C0, C7, C14, C21, C28, C36 and RC12) and *S. spectabile* 'Rosenteller' treated on the same days (R0, R7, R14, R21, R28, R36 and RR12) (Zhang et al., 2019).

In recent years, with global climate change, a concept known as "Sponge City" has begun to be implemented in many urban areas around the world. This concept refers to a set of green architectural and ecological strategies designed to absorb and retain excess rainwater—much like a sponge—rather than draining it quickly during periods of heavy rainfall (Figure 11). This approach has proven to be highly effective in improving urban flood resilience, and plant selection plays a critical role in the successful design and functionality of sponge cities (Pan et al., 2025).

One key component of sponge cities is the use of rain gardens, which are vegetated depressions that collect and infiltrate stormwater. Francini et al. (2022) described several plant species suitable for use in rain gardens, grouped as follows:

- Trees: *Metasequoia glyptostroboides* Hu & W.C. Cheng, *Salix babylonica* L., *Paulownia tomentosa* Steud., *Acer palmatum* Thunb. 'Atropurpureum'
- Shrubs: *Fatsia japonica* Decne. & Planch., *Aucuba japonica* Thunb. 'Variegata', *Loropetalum chinense* Oliv.
- Medicinal and herbaceous plants: *Hemerocallis fulva* (L.) L., *Farfugium japonicum* (L.) Kitam., *Stipa tenuissima* Trin.
- Aquatic or wetland plants: *Phragmites australis* (Cav.) Steud., *Gladiolus gandavensis* Van Houtte, *Iris pseudacorus* L., *Iris tectorum* Maxim., *Lythrum salicaria* L., *Cyperus alternifolius* L.

These species contribute not only to flood mitigation and water regulation but also enhance the aesthetic and ecological value of urban green spaces

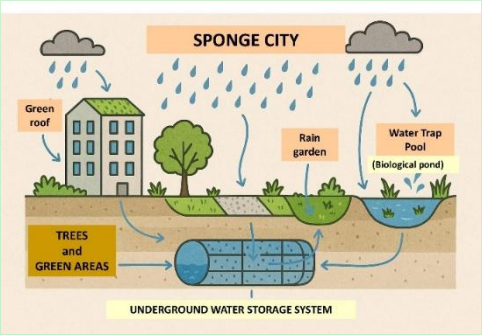

Fig 11. Sponge City Concept

Conclusions

This study provides valuable insights for the selection of ornamental plants suited for flood-prone areas by identifying species and cultivars with demonstrated waterlogging tolerance.

In addition to increased research on advanced breeding approaches for improving waterlogging resistance, further studies are needed to elucidate the molecular mechanisms of stress tolerance in ornamental plants. Therefore, future research should focus on both molecular and applied aspects of waterlogging resistance and aim to translate promising findings into practical applications in urban landscape design and planning.

Water resources management and climate change in South Sudan

Musa Kose

Abstract

South Sudan, one of the least developed countries, is vulnerable to the socioeconomic losses and damages caused by climate change since its people rely on climate-sensitive natural resources for survival. Given the country's recurring droughts, promoting water collection and storage for varied purposes is a high priority. Water availability may be directly affected by poor water quality. This study focuses on how climate change has altered water supplies to assist South Sudan's future water usage and highlights the potential for future research to make a significant impact. The findings of this study will be necessary for future Nile River research, a field that holds great promise. In South Sudan, the quantity and quality of water have dropped during the last two decades. The article also shows how droughts are becoming more frequent, and rivers and streams are shrinking due to climate change. Several once-permanent rivers now have seasonal flows. South Sudan is especially vulnerable to the effects of climate change due to poor infrastructure, several developmental obstacles caused by the protracted civil war, and the fact that 95% of the population relies on climate-sensitive natural resources, particularly rain-fed subsistence agriculture, and total reliance on forests as a source of energy and other environmental goods and services.

Introduction

The impact of climate change on water resources is a pressing concern for both science and policy, particularly as global warming continues to dominate global concerns. According to a 1997 UN report on global freshwater resources, one-third of the world's population lived in countries facing water stress, using more than 20% of their available water supplies. The report predicted that by 2025, up to two-thirds of the global population would live in areas with water shortages (Jubek et al., 2019). However, the effects of climate change on water resources can vary significantly by region. Some areas may experience water shortages, dramatically increasing the number of people at risk due to rising consumption. Conversely, in coastal areas, rising sea levels threaten the lives and livelihoods of millions. Droughts and floods are expected to become more frequent in many parts of the world, leading to increased poverty and hunger, higher economic costs, and potential crop losses. These impacts must be assessed with precise spatial and temporal data to enable long-term water resource planning in light of climate change, a crucial aspect that this research aims to address (Abbaspour et al., 2009).

Water is one of the nation's most valuable natural resources, essential for agricultural production and human life (Albut et al., 2018; Bağdatlı et al., 2024). Climate and water systems are closely linked: climate change affects water availability and usage. Generally, higher temperatures increase water usage, especially for irrigation, while higher precipitation reduces use. However, there is yet to be a definitive historical link between water usage trends and climate, mainly due to limited data and the influence of non-climatic factors (IPCC, 2007). Regional climate models suggest that rising temperatures and reduced rainfall will cause significant declines in water resources.

In South Sudan, water resources are unevenly distributed geographically and seasonally. The country's water availability is highly variable due to frequent severe floods and droughts. Most of the country lies within the Nile River basin, where water is stored in floodplains, ponds, rivers, and wetlands. With low population density and limited industrial development, current water demand remains low, but it is expected to rise sharply with population growth and economic development. In 2007, the Ministry of Water Resources and Irrigation raised concerns about human activities' growing impact on water availability and quality, noting decreasing water tables, reduced river flows, and increased pollution in urban areas (MWRI, 2007).

Water is a naturally renewable resource, continuously circulating through the environment. Water resource assessments must prioritize water flow, although stored water in natural and artificial reservoirs increases availability for human use. The climate system limits the flow rate of renewable freshwater resources (RFWR). While global water withdrawals are currently well below the upper limit, over two billion people live in regions of extreme water stress due to the uneven distribution of RFWR across time and geography. Climate change is expected to accelerate the water cycle, potentially increasing RFWR. This could reduce the number of people experiencing water stress, but changes in seasonal patterns and the likelihood of extreme events may offset these benefits. Reducing current vulnerabilities will be the first step in preparing for these anticipated changes (Jubek et al., 2019).

While water has historically been a source of conflict, it can also provide opportunities for cooperation and peace. In Sudan, effective management of water resources is seen as a pathway to sustainable development and stability. With proper institutions and legal frameworks, water resources can significantly contribute to the country's economic, social, and environmental progress (UNEP, 2020). Studies on climate change in Sudan and South Sudan have mainly focused on temperature and precipitation, the two key climate variables and extreme events (Nasreldin & Elsheikh, 2022; Elsheikh et al., 2022a). Thus, this study aims to assess the effects of climate change on South Sudan's water resources.

Water Resources and climate change in South Sudan

South Sudan, a landlocked country occupying 96% of the Nile River Basin in East-Central Africa, shares borders with Sudan to the north, Ethiopia and Kenya to the east, Uganda and the Democratic Republic of the Congo to the south, and the Central African Republic to the west. Positioned between latitudes 3.5° and 12° North and longitudes 24° to 36° East, it spans 658,842 km². Vast grasslands, wetlands, and tropical forests dominate the landscape. The country's natural resources include significant agricultural, mineral, water, wildlife, forestry, and energy assets (Jubek et al., 2019). South Sudan has one of the lowest population densities in sub-Saharan Africa, with fewer than 13 people per square kilometre. In the arid northern regions, livelihoods are primarily based on seasonal agriculture, pastoralism, fishing, and hunting, while the wooded savannas in central South Sudan offer diverse livelihood opportunities. The country is divided into three regions—Bahr el Ghazal, Equatoria, and Greater Upper Nile—and was initially organised into ten states, which have since increased to thirty-two (MWRI, 2016).

Water availability in upstream and downstream regions of transboundary river basins is a sensitive issue. South Sudan's location in the middle of the Nile Basin, between downstream countries like Egypt, Ethiopia, and Sudan, and upstream Nile Equatorial countries such as Burundi, Kenya, and Uganda, means that its water quality and quantity are influenced by water retention, withdrawals, and development activities in these neighbouring states (Fernando & Garvey, 2013). Through floods and groundwater flow, lateral water transfers move water between surplus and deficit areas. However, monitoring water flows throughout the Nile Basin is challenging due to variations in how each country and sector measures water data, such as withdrawals, stocks, and wastewater return flows. Earth observation data provide insight into the basin's main water flows and fluxes (Bastiaanssen et al., 2014).

Water usage in the Nile Basin threatens its ability to meet future demand, especially for South Sudan. Over 80% of the water withdrawn from the basin is used for irrigated agriculture. South Sudan's water withdrawal remains low relative to other Nile Basin countries (Jubek et al., 2019). Before 2011, Sudan's total water withdrawal was estimated to be around 27,590 million m³, with agriculture accounting for 26,150 million m³. Post-2011, South Sudan's annual water withdrawal is estimated to be about 658 million m³, or 1.3% of its total renewable water resource, with agriculture still using the majority (FAO, 2016; MWRI, 2016).

As water resources become increasingly strained due to societal demands, understanding climate change's effects on the water cycle is crucial for managing this resource. Water management strategies, such as operational adjustments, demand management, and infrastructural changes, must be considered to adapt to climate change. Resource supply, system demands, and performance requirements will likely shift due to climate impacts, requiring diverse strategies and preferences for adaptation (Levi et al., 2009; Elsheikh et al., 2023; Elsheikh et al., 2024). Cooperation between regions that share water resources is critical for improving management. However, climate change and rising water demand may exacerbate conflicts over water, mainly where unilateral actions to address shortages could increase competition. Changes in land productivity could also result in new agricultural systems, potentially leading to environmental stress, including soil erosion and biodiversity loss (Meier et al., 2007).

In South Sudan, where surface water resources may become increasingly inaccessible, the demand for groundwater will likely rise, particularly as irrigation agriculture expands to meet the growing population's food demands. Although irrigation remains limited, effective water resource management and accurate demand projections ensure the country's stability (Jubek et al., 2019). South Sudan's water resource management strategies aim to improve water resource mapping, evaluation, and monitoring capabilities, enhance the water information system, and promote sustainable management and conflict prevention (MWRI, 2016). National governments, particularly in less developed countries, must implement key water management measures to address the effects of climate change on water resources. This includes identifying areas at risk of shortages, promoting the construction of water harvesting infrastructure, improving water and sanitation facilities in urban areas, and developing supplemental irrigation systems in rural areas to increase food security. Additionally, establishing legal frameworks to penalise water pollution and manage waste effectively is essential (Wada & Bierkens, 2014; Jubek et al., 2019).

Since 1970, global surface air temperatures have significantly increased. Independent research teams have processed data from various sources, showing a consistent warming trend supported by the melting of Arctic sea ice, glacier retreat, and other indicators (Elsheikh et al., 2022b). As climate change continues, droughts and floods are expected to become more frequent, with precipitation patterns increasingly concentrated in heavy events. This

uneven distribution of rainfall, influenced by topography and atmospheric circulation, is already altering precipitation patterns globally, including in South Sudan (Elsheikh, 2021a; Bağdatlı et al., 2023).

In South Sudan, subsistence agriculture, which depends on rain-fed farming and traditional methods, forms the economic backbone for 78% of households. This makes the country highly vulnerable to climate change, particularly irregular rainfall. Droughts and floods threaten livestock, crop production, and natural habitats, while flash floods damage low-lying forests near wetlands and rivers (Jubek et al., 2019). Global action is required to mitigate the effects of climate change, including reducing carbon emissions and preventing global warming (Elsheikh, 2021b). South Sudan's Sudd wetland, vital in regulating regional weather patterns, is particularly vulnerable to these changes. Effective water resource management in South Sudan is crucial to mitigate the impacts of climate change, ensure sustainable development, and prevent conflicts over water.

Conclusion

The Republic of South Sudan needs to strengthen environmental health infrastructure to prevent the spread of water-borne diseases, significantly as climate change worsens water quality and availability. The rising population and increasing demand for water will further strain the country's water resources in the coming years. The pressure on these resources will be unevenly distributed globally, with some regions, including South Sudan, feeling the impact more acutely and urgently. Climate change can either exacerbate or alleviate stress on water resources, depending on various factors such as climate scenarios, water demand, and the quality and quantity of available water.

Water quantity and quality in South Sudan have declined significantly over the past two decades. Rivers that once flowed year-round are now seasonal, and the reduction in water flow has led to increased siltation, particularly in downstream areas where sediment accumulates. Urban water quality has deteriorated due to the direct discharge of municipal wastewater, sewage, and industrial effluents into water bodies. The lack of adequate wastewater and sanitation management has resulted in widespread contamination, contributing to repeated outbreaks of gastrointestinal diseases and posing additional threats to already stressed water resources. To mitigate these issues, South Sudan must prioritise upgrading water and sanitation infrastructure, improving wastewater management, and implementing strategies to adapt to the effects of climate change on water availability and quality. Proper management will be crucial to safeguarding public health and ensuring a sustainable water supply in the face of growing environmental challenges.

Biodegradable Materials Production from Food Waste: A Sustainable Approach

Şehnaz Özatay

Çanakkale Onsekiz Mart Üniversitesi

Abstract

Food waste has become a significant global issue, contributing to environmental degradation through methane emissions in landfills. This research explores the potential of utilizing food waste as a source for producing biodegradable materials, offering a sustainable alternative to petroleum-based plastics. By examining various studies and advancements in this area, the research discusses the potential benefits, challenges, and future prospects of converting food waste into eco-friendly products. Food waste is a critical issue worldwide, with approximately one-third of food produced for human consumption being discarded. This waste, often sent to landfills, decomposes anaerobically, generating methane, a potent greenhouse gas. To mitigate the environmental impacts of food waste, innovative solutions are being explored, including converting it into biodegradable materials. This approach not only addresses the problem of waste disposal but also provides an alternative to conventional plastics, which are derived from non-renewable resources and contribute to long-term environmental pollution.

Abstract

The European Union faces significant challenges in ensuring protein security, particularly in the livestock sector. To address this issue, Agrolok sp. z o.o. has developed an innovative high-protein feed component derived from Polish non-GMO soybeans. This study focuses on optimizing the processing conditions of soybeans through hydrobarothermal treatment (HBT) to enhance protein content, digestibility, and amino acid availability. The treated soybean meal was evaluated for its nutritional benefits in poultry diets, with a focus on growth performance, feed efficiency, and nutrient utilization. Preliminary results demonstrate that HBT significantly improves the protein quality of soybean meal by reducing anti-nutritional factors and increasing the bioavailability of essential amino acids. Poultry fed with HBT-treated soybean meal exhibited superior weight gain, feed conversion ratios, and overall nutrient absorption compared to those fed with conventionally processed soybean meal. These findings highlight the potential of HBT-treated non-GMO soybean meal as a sustainable and efficient protein source for poultry nutrition. By enhancing the nutritional profile of SBM, this approach not only supports animal health and performance but also aligns with consumer preferences for non-GMO and sustainable feed ingredients. The improved feed efficiency and reduced environmental impact further emphasize the economic and ecological benefits of this technology. Future research will focus on scaling up the production process and conducting long-term trials to validate these findings. This project represents a significant step toward meeting the protein needs of the livestock industry while promoting sustainable agricultural practices in the EU.

Key Words: *SBM, Amino Acids, Sustainable, Poultry Nutrition, Processing Technology*

Introduction

Protein security remains a critical challenge for the European Union (EU), particularly in livestock and poultry production, where the demand for high-quality, sustainable protein sources continues to rise. Soybean meal (SBM) is the most widely used protein ingredient in poultry diets due to its high crude protein content, favorable amino acid profile, and excellent digestibility (Asghar et al., 2024). However, the EU's heavy reliance on imported, genetically modified (GM) soybean accounting for 80–95% of plant protein-rich feed materials has raised environmental, health, and socio-economic concerns (Gil et al., 2024). These include the extensive use of herbicides such as glyphosate, risks of gene transfer, potential allergenicity, and consolidation of GM seed ownership among a few multinational corporations (Aderibigbe et al., 2020). Moreover, the EU is only 3% self-sufficient in soybean and SBM production, making this reliance unsustainable and vulnerable to market volatility (Chisoro et al., 2025). As a result, there is growing interest in increasing the cultivation and processing of locally grown, non-GMO soybeans to reduce dependency on imports and enhance feed sustainability.

Traditional soybean processing methods, particularly hexane-based solvent extraction, present additional sustainability challenges (Preece et al., 2017). These conventional techniques are not only energy-intensive but also involve hazardous chemicals, while often failing to adequately reduce anti-nutritional factors that impair poultry nutrient absorption (Chisoro et al., 2025). The resulting protein quality limitations contribute to feed inefficiencies, with feed costs representing 60-70% of total poultry production expenses (Asghar et al., 2021,2022; Rauw et al., 2023). This economic burden, combined with increasing environmental regulations under the EU Green Deal, necessitates innovative solutions for protein production and processing.

In response to this challenge, Agrolok sp. z o.o. has developed an innovative solution using hydrobarothermal treatment (HBT) to process Polish non-GMO soybeans. HBT is a thermal and pressure-based technique that improves the nutritional quality of soybean meal by reducing anti-nutritional factors (ANFs), enhancing protein digestibility, and increasing the bioavailability of essential amino acids (Asghar et al., 2024; Chojnacka et al., 2021). Unlike conventional hexane-based solvent extraction, which is energy-intensive, hazardous, and

environmentally unfriendly, HBT offers a safer and more sustainable alternative (Sakkas et al., 2019). Preliminary studies have demonstrated that poultry fed with HBT-treated SBM show improved growth performance, feed conversion ratios, and nutrient absorption compared to those consuming traditionally processed SBM. Additionally, HBT-SBM contributes to environmental sustainability by lowering nitrogen excretion and supporting more efficient nitrogen utilization in poultry (Asghar et al., 2024; Zhu, et al., 2023). Hydrobarothermal treatment (HBT) has emerged as a transformative technology for processing European-grown non-GMO soybeans. Developed by Agrolok sp. z o.o., this method utilizes controlled heat and pressure to significantly enhance the nutritional quality of soybean meal (Orlich et al., 2023). Compared to conventional processing, HBT achieves superior reduction of anti-nutritional factors (90-95% trypsin inhibitor inactivation) while better preserving essential amino acids (>95% lysine retention) (Deng and Kim 2024). Feeding trials demonstrate that poultry receiving HBT-treated soybean meal show 5-8% improved growth performance and feed conversion ratios, along with enhanced gut health markers ((Asghar et al., 2024; Chojnacka et al., 2021).

The adoption of HBT technology offers multiple strategic benefits for the EU:

- Enhanced feed security through utilization of domestically grown non-GMO soybeans
- Improved sustainability with 20-25% lower carbon footprint compared to imported soybean meal
- Economic advantages through better feed efficiency and potential for regional processing
- Alignment with policy goals under the Farm to Fork Strategy and European Green Deal

Small-to-medium scale decentralized processing using HBT could particularly benefit EU agriculture by:

- Reducing transportation emissions through local production
- Creating new value chains for European soybean growers
- Providing premium, traceable feed ingredients for poultry producers

As the EU transitions toward more sustainable agricultural practices, technologies like HBT represent crucial tools for developing resilient, environmentally responsible protein supplies (Orlich et al., 2023). Their implementation supports not only improved poultry nutrition and farm economics but also broader objectives of food sovereignty and climate-smart agriculture in Europe.

Given that feed costs constitute 60–70% of total poultry production expenses (Asghar et al., 2021,2022; Naimati et al. 2022) improving feed efficiency through innovative processing can significantly benefit producers economically (Akram et al., 2019, 2021). This is particularly important as the EU shifts toward more environmentally responsible and welfare-conscious farming practices. Furthermore, small- to medium-scale decentralized processing of non-GMO soybeans could empower regional agriculture, reduce logistics-related emissions, and promote protein self-sufficiency (Woźniak et al., 2019). This review aims to provide a comprehensive analysis of the role of HBT-treated non-GMO soybean meal in enhancing poultry nutrition, with a focus on its nutritional, functional, environmental, and economic implications. It also addresses the broader significance of adopting sustainable soybean processing technologies to meet the EU's protein demands while aligning with evolving agricultural and consumer standards.

The EU Protein Deficit and Its Implications for Sustainable Poultry Nutrition

The European Union faces a critical protein deficit, importing over 70% of its protein-rich feed ingredients, primarily soybean meal, from non-EU sources, mainly Brazil, Argentina, and the United States (Sierżant et al., 2023; Sepngang et al., 2020). This heavy dependence creates substantial vulnerabilities in supply chain stability, economic sustainability, and environmental compliance. Recent global crises have exposed the fragility of long-distance protein supply chains, while the EU's annual expenditure on protein imports exceeds €10 billion (Rotundo et al., 2024). Furthermore, approximately 60-70% of imported soy has been linked to deforestation risks in South America (Song et al., 2021), conflicting with growing consumer demand for GMO-free animal products and stricter sustainability requirements under the EU Green Deal (McMichael 2021). Currently, EU soybean production meets only about 8% of domestic demand due to agronomic limitations in northern member states, yield disparities compared to major exporting countries, and competition for arable land with higher-value crops (Sajid et al., 2023; Sepngang et al., 2020). This protein gap affects the entire agri-food value chain, reducing the competitiveness of EU livestock farming due to feed cost volatility, limiting innovation potential in feed formulation, and creating challenges in meeting consumer demands for traceable, sustainable animal products. The Farm to Fork Strategy (Pío Beltrán et al., 2022) aims to address this deficit by reducing reliance on imported plant proteins by 2030, increasing cultivation of EU protein crops by 25%, and improving sustainability of livestock production systems. Achieving these goals requires overcoming significant technical and economic barriers through development of high-yielding, climate-resilient soybean varieties, implementation of advanced processing technologies like hydrobarothermal treatment, and creation of supportive policy frameworks and market incentives to enhance the viability of European-grown protein crops as competitive alternatives to imported feedstuffs (Asghar et al., 2024).

The Need for Advanced Processing Techniques for European Non-GMO Soybeans in Poultry Nutrition

The European Union's transition toward protein self-sufficiency through domestic non-GMO soybean production requires advanced processing technologies to overcome the limitations of conventional methods. Traditional techniques such as thermal toasting (100-130°C) and mechanical extrusion (130-180°C) demonstrate insufficient efficacy, achieving only 60-80% reduction of trypsin inhibitors while causing 15-25% loss of heat-sensitive amino acids through Maillard reactions (Abdollahi et al., 2022). These methods also leave 40-50% of lectins and 30-40% of oligosaccharides intact, compromising protein quality and gut health in poultry (Norozi et al., 2022).

These limitations necessitate the development of advanced processing technologies that maximize nutritional value while minimizing undesirable effects. Hydrobarothermal treatment (HBT), which integrates controlled heat, moisture, and pressure, has emerged as a superior alternative, offering more efficient ANF inactivation, enhanced protein solubility, and improved amino acid preservation compared to traditional methods (Asghar et al., 2024). By optimizing these parameters, HBT can transform European non-GMO soybeans into a high-quality, locally sourced protein supplement for poultry diets, aligning with both nutritional efficiency and sustainability goals. The adoption of such innovative processing techniques is critical not only for improving feed formulations but also for supporting the EU's transition toward a more resilient, self-sufficient, and environmentally responsible livestock industry. Hydrobarothermal treatment (HBT) has emerged as a technologically superior solution, employing precisely controlled parameters (110-150°C, 3-10 bar pressure, 15-30% moisture) to achieve 90-95% ANF inactivation while preserving >95% of essential amino acids (Orlich et al., 2023). This advanced processing method demonstrates three key advantages over conventional approaches: (1) superior protein digestibility (90-92% vs 82-85%), (2) complete inactivation of trypsin inhibitors (>90% vs 60-80%), and (3) significant reduction of oligosaccharides (70-75% vs 30-40%) (Asghar et al., 2024; Pope et al., 2023). The limitations of conventional processing become particularly evident when examining the nutritional composition of processed soybean products. Standard thermal treatments typically achieve only partial inactivation of trypsin inhibitors (60-80% reduction), while simultaneously causing 15-25% loss of heat-sensitive amino acids (Andrade et al., 2016). Furthermore, these methods often fail to adequately address other ANFs such as lectins and oligosaccharides, which can negatively impact gut health and nutrient absorption in poultry (Avilés-Gaxiola et al., 2018). The resulting suboptimal protein quality directly affects feed conversion ratios and growth performance, ultimately compromising the economic viability of poultry operations.

Field trials confirm these technical benefits translate to measurable performance improvements, including 5-8% better feed conversion ratios and 7-10% enhanced amino acid utilization in poultry (Zampiga et al., 2021).

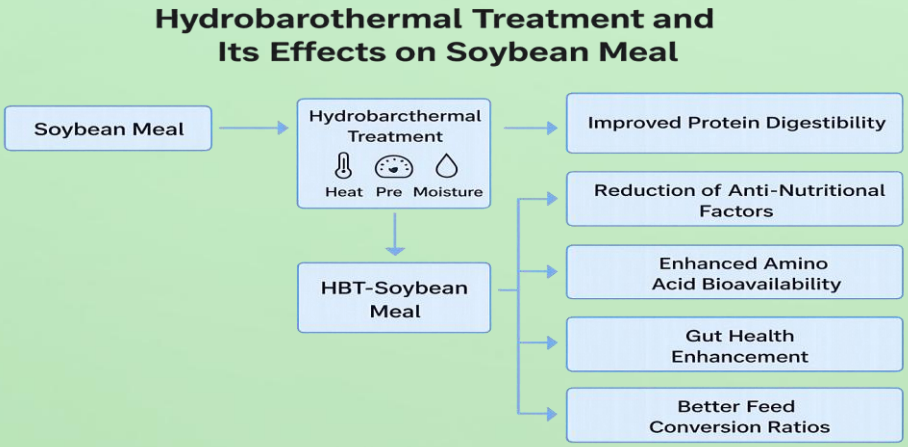
The implementation of HBT technology aligns with critical EU strategic objectives by:

- Enhancing nutritional efficiency through improved protein quality
- Reducing the carbon footprint of poultry feed by 20-25%
- Decreasing soybean import dependence by 30-40% (Chojnacka et al., 2021)

The transition to advanced processing technologies does present certain challenges that must be addressed. Initial capital investments for specialized equipment can be substantial, and the industry requires standardized protocols to ensure consistent product quality across processing facilities. Additionally, comprehensive life cycle assessments are needed to fully evaluate the environmental benefits compared to conventional methods. However, the long-term advantages in terms of improved feed efficiency, reduced environmental impact, and enhanced food security justify these investments and warrant policy support for technology adoption. Current adoption faces several challenges including high capital expenditure (€2.5-3.5 million for industrial-scale systems) and pending EFSA approval under Novel Feed regulations (expected 2025). However, pilot plants in France and Poland demonstrate promising 12-18 month return on investment periods through improved feed efficiency.

Future research should focus on:

- Developing hybrid HBT-enzymatic processing systems
- Optimizing parameters for different soybean varieties
- Establishing standardized quality protocols
- Conducting comprehensive life cycle assessments



With appropriate policy support under CAP 2023-2027, HBT technology has the potential to transform 30-40% of EU poultry feed protein supply by 2030, simultaneously addressing nutritional, environmental, and food security challenges while meeting growing consumer demand for sustainable, non-GMO animal products.

Future research directions should focus on optimizing processing parameters for different poultry production systems, developing hybrid technologies that combine HBT with enzymatic treatments, and establishing clear quality standards for processed protein ingredients. The integration of these advanced processing methods with precision feeding systems could further enhance their effectiveness, contributing to the development of more sustainable and efficient poultry production systems in the EU.

Hydrobarothermal Treatment and Its Effects on Soybean Meal in Poultry Nutrition

Hydrobarothermal (HBT) treatment represents a significant advancement in feed processing technology, employing controlled heat (110-150°C), pressure (3-10 bar), and moisture (15-30%) to optimize the nutritional quality of soybean meal (SBM) (Kopacz et al., 2021). This innovative process achieves superior inactivation of anti-nutritional factors (ANFs), reducing trypsin inhibitors by 90-95% and lectins by 85-90%, while conventional methods typically only achieve 70-85% and 60-75% reduction respectively (Asghar et al., 2024). The enhanced protein modification during HBT processing improves crude protein digestibility to 90-92%, compared to 82-85% in conventionally processed SBM, with particularly notable retention (>95%) of critical amino acids like lysine and methionine (Sakkas et al., 2019).

The nutritional advantages of HBT-treated SBM translate directly to improved poultry performance metrics. Broilers fed HBT-SBM demonstrate 5-8% greater weight gain (2.5kg vs 2.3kg final weight) and 3-5% better feed conversion ratios (1.45 vs 1.55) (Boroojeni et al., 2016). In layers, these benefits manifest as 2-3% higher egg production and 5-7% improved shell strength due to enhanced mineral absorption. The technology's impact on gut health is particularly significant, with HBT-fed birds showing 25-30% lower intestinal inflammation markers and 15-20% greater villi surface area, leading to more efficient nutrient absorption (Asghar et al., 2024; Cowieson et al., 2020).

From an environmental perspective, HBT processing contributes to sustainable poultry production by improving nitrogen utilization efficiency by 10-15%, thereby reducing nitrogen excretion in manure by 20-25%. When combined with regional non-GMO soybean sourcing, the technology can decrease the carbon footprint of poultry feed by 30-40% compared to imported conventional SBM (Beltranena and Zijlstra 2022). These advantages align with multiple EU policy objectives, including the Farm to Fork Strategy's goals for sustainable protein sources and the European Green Deal's climate targets (Chojnacka et al., 2021).

The economic viability of HBT-SBM is demonstrated by breakeven analyses showing the 8-10% price premium is offset within 12-18 months through improved feed efficiency and production outcomes (Rauw et al., 2023). As the poultry industry seeks solutions that combine nutritional excellence with environmental responsibility, HBT-treated SBM emerges as a technologically advanced feed ingredient capable of addressing contemporary challenges in animal nutrition, sustainability, and food security.

Sustainability and Non-GMO Advantages of Hydrobarothermal-Treated Soybean Meal

The adoption of hydrobarothermal-treated non-GMO soybean meal (HBT-SBM) in poultry nutrition presents significant sustainability and health benefits, aligning with global trends toward environmentally responsible and health-conscious food production. Non-GMO soybeans are increasingly preferred in the EU market due to growing consumer concerns about the potential ecological and health impacts of genetically modified crops (Bürgin 2023). Cultivation of non-GMO varieties supports agricultural biodiversity by minimizing risks of gene flow to wild relatives and reducing dependence on broad-spectrum herbicides like glyphosate, which have been linked to ecosystem disruption and potential human health risks (Leinonen et al., 2013). From an environmental perspective, HBT processing enhances the nutritional efficiency of soybean meal by improving protein digestibility (90-92% vs 82-85% in conventional SBM) and amino acid bioavailability, which translates to better feed conversion ratios (1.45 vs 1.55) and reduced nitrogen excretion in poultry waste (Lu et al., 2017). This nutritional optimization contributes to a 20-25% lower carbon footprint per kg of poultry produced compared to conventional soybean-based diets (Ma et al., 2019). Furthermore, regional sourcing of non-GMO soybeans reduces reliance on imported feed ingredients, decreasing transportation-related emissions by an estimated 30-40% while strengthening local agricultural economies (Basnet et al., 2023). The combination of non-GMO status with HBT technology supports multiple EU policy objectives, including the Farm to Fork Strategy's goals for sustainable food systems, the European Green Deal's climate targets, and the Organic Action Plan's emphasis on natural production methods

(Kassim et al., 2020). These synergistic benefits position HBT-SBM as a comprehensive solution addressing contemporary challenges in poultry nutrition, including environmental sustainability, feed efficiency, and consumer demand for clean-label animal products.

Comparative Performance with Conventional Soybean Meal

Hydrobarothermally-treated soybean meal (HBT-SBM) demonstrates superior nutritional and performance characteristics compared to conventional soybean meal (CSBM) in poultry diets. While traditional solvent extraction methods effectively remove oil, they often leave residual anti-nutritional factors (ANFs) including trypsin inhibitors (15-20% remaining) and lectins (10-15% remaining) that impair nutrient absorption (Chojnacka et al., 2021). In contrast, HBT processing achieves 90-95% reduction of these ANFs while preserving >95% of heat-sensitive amino acids like lysine (Wang et al. 2023). This technological advantage translates to measurable performance benefits: broilers fed HBT-SBM show 5-8% higher weight gain (2.5kg vs 2.3kg final weight) and improved feed conversion ratios (1.45 vs 1.55) due to enhanced protein digestibility (90-92% vs 82-85% for CSBM). The superior nutrient profile of HBT-SBM supports better muscle development and feathering, while gut health metrics reveal 25-30% lower inflammatory markers and 15-20% greater villi surface area (Rysman et al. 2023). Layer performance shows parallel improvements, with 2-3% higher egg production and 5-7% stronger eggshells attributed to enhanced mineral absorption (Qiao et al. 2015). Economic analyses confirm these zootechnical advantages offset HBT-SBM's 8-10% price premium within 12-18 months of adoption (Rauw et al., 2023). Furthermore, life cycle assessments demonstrate HBT-SBM reduces the carbon footprint of poultry production by 20-25% compared to CSBM-based diets (European Commission, 2009). These comprehensive benefits establish HBT-SBM as a nutritionally, economically, and environmentally superior alternative to conventional soybean meal in modern poultry production systems.

Challenges and Future Perspectives of Hydrobarothermal Treatment for EU Poultry Nutrition

The implementation of hydrobarothermal treatment (HBT) for non-GMO soybean processing in EU poultry nutrition presents both significant opportunities and challenges that must be addressed for successful adoption. From a technical perspective, the process requires precise control of temperature (110-150°C) and pressure (3-10 bar) parameters, as minor deviations can reduce anti-nutritional factor (ANF) inactivation efficiency by 15-20% (Asghar et al., 2024). The substantial capital expenditure for industrial-scale HBT reactors, estimated at 40-60% higher than conventional extruders, creates economic barriers particularly for small producers (Chojnacka et al., 2021). Current market analyses indicate HBT-processed soybean meal commands a €50-70/ton premium over traditional products, with return on investment periods exceeding 3-5 years without subsidies (Eurostat, 2024). Regulatory hurdles further complicate adoption, as EFSA certification under EU Regulation 2015/2283 typically requires 24-36 months, while strict 0.9% GMO contamination thresholds impose additional quality control challenges.

Scalability remains a critical limitation, as existing infrastructure may not support widespread commercial production, particularly in regions lacking medium or small-scale processing facilities (Srai et al., 2016). The need for technical expertise and the high initial investment create implementation barriers, especially for smallholders (Lee and Gambiza 2022). While preliminary studies show promising results, comprehensive long-term trials are needed to validate consistent performance benefits across different poultry breeds and production systems (Asghar et al., 2024).

Future research should prioritize several key areas: development of hybrid technologies combining HBT with enzymatic pre-treatments to enhance phosphorus bioavailability by 30-40% (Asghar et al., 2024), implementation of AI-controlled systems to optimize processing parameters (Chojnacka et al., 2021), and detailed nutritional studies on HBT's effects on poultry gut microbiomes. The potential for amino acid fortification through co-processing with alternative protein sources like insect meal deserves exploration (EU Horizon PROTEIN2Food project). From a sustainability perspective, developing life cycle assessment protocols to quantify HBT's 20-30% lower carbon footprint compared to imported soybean meal is crucial (IPCC Tier 2 methodology), along with valorization strategies for byproducts like wastewater-to-biogas conversion (15m³ CH4/ton waste in pilot studies). Policy interventions will be critical for overcoming these barriers. Potential measures include CAP reforms for equipment subsidies, reduced VAT schemes for poultry products using EU-processed soybean meal (modeled after French "Label Rouge"), and establishment of public-private research consortia through initiatives like EIT Food to accelerate commercial scaling (target: 50+ HBT plants by 2030). With coordinated efforts across technical, economic, and regulatory dimensions, HBT technology could achieve 30% market penetration for EU poultry feed by 2030 (Delgado et al., 2023), significantly enhancing the bloc's protein self-sufficiency while meeting sustainability goals. The growing demand for eco-friendly feed ingredients and advances in processing technology create favorable conditions for HBT adoption, provided that challenges in cost reduction, energy efficiency, and regulatory compliance can be successfully addressed through continued research and policy support.

Conclusion

Hydrobarothermal-treated non-GMO soybean meal (HBT-SBM) represents a significant advancement in sustainable poultry nutrition, offering enhanced protein digestibility, reduced anti-nutritional factors, and improved amino acid bioavailability. This innovative processing method aligns with the growing demand for non-GMO, environmentally responsible feed ingredients while also addressing the European Union's protein security concerns. Compared to conventional soybean meal, HBT-SBM delivers superior growth performance, feed efficiency, and gut health benefits in poultry, making it a valuable alternative in modern feed formulations. Although challenges such as production scalability and economic feasibility persist, ongoing research and technological development are expected to overcome these barriers. As the industry continues to shift toward more sustainable and transparent food systems, HBT-SBM stands out as a promising solution that supports animal health, environmental stewardship, and consumer trust.

Hydrobarothermal-treated non-GMO soybean meal presents a sustainable and effective alternative for enhancing poultry nutrition. Its ability to improve protein digestibility, promote gut health, and support better feed efficiency makes it a promising solution for the poultry industry. Further research and industry adoption will determine its potential in large-scale poultry production systems.

Niğde Patates Ekim Alanlarında Bulunan Solanum spp. (Köpek Üzümü) Biyotiplerinin Metribuzin Kullanımına Bağlı Dayanıklılık Mekanizmaları

Özgür Kıvılcım Kılınç[1,2], François Laurent[2]

[1]Süleyman Demirel Üniversitesi, Isparta, Türkiye, ozgur.kilinc@yahoo.fr
[2]UMR 1331 TOXALIM INRA-ENVT-INP EI Purpan-UPS. 180, Tournefeuille – BP 93173 F-31027 TOULOUSE

Özet

Metribuzin, triazinon kimyasal ailesine ait bir herbisittir. Patates ekim alanlarında yabancı ot mücadelesinde çıkış öncesi ve çıkış sonrası olarak uygulanmaktadır. Metribuzin etki mekanizmasını, fotosistem II'de bulunan D1 proteinine bağlanarak fotosentez için gerekli olan elektron transferini durdurarak fotosentezi engelleme şeklinde ve hedef bitkilerde oksidatif stres oluşturarak ölüme yol açarak gösterir. Ancak bazı yabancı ot türleri, uzun süreli herbisit kullanımına bağlı olarak farklı dayanıklılık mekanizmaları geliştirebilir. Ancak patates ile aynı familyadan olan *Solanum spp.* (Köpek Üzümü) türü yabancı otların mücadelesinde giderek artan bir şekilde çoğu durumda etkili olmamakta ve Türkiye'de önemli ürün kayıplarına neden olmaktadır.

Bu çalışmada; Niğde patates ekim alanlarında bulunan Köpek Üzümü popülasyonlarının metribuzine karşı dayanıklılık nedenleri araştırılmıştır. Patates ekim alanlarından toplanan dayanıklı köpek üzümü popülasyonlarının metribuzin toleransının nedenleri, metribuzinin kök ve yapraklar yoluyla bitki bünyesine alınımı, hedef bölge olan yapraklara kadar taşınımı, bitkilerin farklı organlarda metabolizasyonu(detoksifikasyonu) incelenmiştir.

İlk aşamada patates ekim alanlarından dayanıklılık şüphesi tespit edilen 4, karşılaştırma amaçlı olarak metribuzine hiçbir şekilde maruz kalmamış patates ekim alanları dışından hassas 1 popülasyon laboratuvar şartlarında sıcaklık ve nem kontrollü basitleştirilmiş sistemlerde incelenmiştir.

Farklı biyotiplerin metribuzin toleransı, metribuzin adsorpsiyon kapasiteleri, molekülün bitkilerin toprak üstü kısımlarına transfer hızları, metribuzinin hedef bölgesi olan yapraklar ve diğer bitki kısımlarındaki metribuzin konsantrasyonları ve metabolitleri belirlenerek değerlendirildi. Farklı organlardaki metabolizma hızı ve ortaya çıkan metabolitler daha ayrıntılı olarak belirlenmiştir. Bu çalışma ^{14}C-metribuzin (^{14}C ile işaretlenmiş radyoaktif metribuzin) kullanılarak çeşitli radyometrik yöntemlerden (Farklı ekstraksiyon metotları, Radio-HPLC (radyokromatografisi), otoradyografi, oxidizer vb.) faydalanılmıştır.

Uzun yıllar boyunca devamlı olarak metribuzin uygulaması yapılmış patates ekim alanlarından elde edilen dayanıklılık şüphesi olan biyotipler, ekilmemiş topraklardan elde edilen biyotiplere göre metribuzine daha fazla tolerans göstermektedir. *Solanum nigrum* türlerinin metribuzini kökten alım kapasitesi yoğun olup, hedef organlara transferi yüksektir. Bu davranış, bu molekülün güçlü hidrofilitesine (Kow = 1.6) bağlıdır. Ancak otoradyografik çalışmalar bitkideki metribuzin kalıntılarının kompartmanlaştığını ve radyoaktivitenin iletken dokularda tutulduğunu göstermektedir. Hedef doku düzeyinde metribuzin konsantrasyonu için elde edilen değerler, çalışılan biyotiplere bağlı olarak çok farklıdır, yaprak düzeyinde kritik konsantrasyonda belirgin farklılıklar vardır.

Köklerden alınan metribuzinin, birkaç gün içinde hızlı bir şekilde metabolize edildiği tespit edilmiştir. Bundan dolayı gövde ve yapraklardaki metribuzin konsantrasyonu oldukça düşüktür. Bitkilerin kökleri ve toprak üstü dokularında metribuzinin metabolizasyonu sonucu ortaya çıkan metabolitlerde farklılıklar görülmektedir. Köklerde çeşitli hidrofilik konjuge kalıntıların yanında birçok lipofilik metabolitlerin ortaya çıktığı; yapraklarda ise yalnızca konjuge kalıntıların bulunduğu belirlenmiştir.

Sonuç olarak; patates ekim alanlarında bulunan biyotiplerin toleransı, metribuzinin asıl hedef bölgesi olan kloroplastlara taşınma kapasitelerinin düşük olmasıyla ilişkili olabilir. Bu durum bir yandan herbisitin kök seviyesindeki çok aktif detoksifikasyon kapasitesine diğer yandan ise kök ve gövde ayrışması (vasküler dokularda tutulma) için eşit derecede dikkate değer bir potansiyele sahip olmasına bağlanabilir; bu sayede aktif maddenin bu kloroplastlara transferi büyük ölçüde azaltılabilmektedir.

Tüm bu sonuçlar değerlendirildiğinde metribuzinin çıkış sonrası uygulamaları, metribuzinin asıl hedef bölgesi olan yapraklara (Kloroplastlar) ulaşmasını ve sadece yaprak penetrasyonu yoluyla uygulama dozunun tamamının bitki bünyesine alınmasını kolaylaştırabilir. Böylece kökler ve iletim demetlerince tutulma ve metabolizasyon aşamalarını atlatarak daha etkili olabilir.

Anahtar kelimeler: *Patates, metribuzin, Solanum spp., dayanıklılık, tolerans detoksifikasyon, transfer.*

ID: 353

Nohut'ta (Cicer arietinum L.) metribuzinin metabolizasyonu ve transferi

Özgür Kıvılcım Kılınç

Süleyman Demirel Üniversitesi, Isparta, Türkiye, ozgur.kilinc@yahoo.fr

Özet

Yabancı ot kontrolü nohut *(Cicer arietinum* L.) üretimindeki en önemli kısıtlamalardan biri olmaya devam etmektedir. Türkiye'de nohut ekim alanlarındaki yabancı otları yabancı otları kontrol altına almak için tamamen seçici herbisit sayısı çok azdır ve bu herbisitlerin birçoğu ithal ve pahalıdır. Dahası üreticilerin uygulama zamanı ve dozlarında yaptıkları hatalardan dolayı nohutta fitotoksisite hasarlarına sıklıkla rastlanmakta ve ciddi verim kayıpları ortaya çıkmaktadır. 2020 yılından bu yana, bir triazinon herbisiti olan metribuzin, Türkiye'de nohut ekim alanlarında görülen çeşitli tek ve çift çenekli yabancı otların kontrolü için, 140 ml/da dozda, çıkış öncesi uygulamalar için tescil edilmiştir. Bu çalışmanın amacı; nohutun metribuzine karşı toleransının temellerini belirlemek ve bitki bünyesinde metribuzine karşı verdiği farklı tepkimeleri ölçmektir. Çıkış öncesi uygulamalar sonucu nohut'un metribuzini adsorpsiyon kapasitesi, bitkilerin toprak üstü kısımlarına transfer hızı, metribuzinin hedef bölgesi olan yapraklar ve diğer bitki kısımlarındaki metribuzin konsantrasyonları ve metabolitleri belirlenerek değerlendirilmiştir. Farklı organlardaki metabolizasyon hızları ve ortaya çıkan metabolitler daha ayrıntılı olarak belirlenmiştir. Bu çalışma ^{14}C-metribuzin (^{14}C ile işaretlenmiş radyoaktif metribuzin) kullanılarak çeşitli radyometrik yöntemlerden (farklı ekstraksiyon metotları, Radio-HPLC (radyokromatografisi), otoradyografi, oxidizer vb.) faydalanılmıştır. Metribuzin toleransı, kökler tarafından emilimi ve metabolizasyonu çalışmalarında Fransız kökenli Kabuli bir varyete olan TWIST çeşidi ısı ve nem kontrollü bitki büyütme kabinlerinde basitleştirilmiş sistemlerde incelenmiştir. Metribuzinin kökler ve kotiledonlar tarafından emilim kapasitesi, toprak üstü kısımlara transfer hızı, gövde ve hedef bölge olan yapraklardaki metribuzin konsantrasyonları bitkiyi farklı organlara ayırarak her organ için metribuzinin konsantrasyonu belirlenmiştir. İkinci aşamada ise farklı organlardaki metabolizasyon aşamaları incelenmiştir. Bu analizler ^{14}C-metribuzin kullanılarak ve çeşitli radyometrik yöntemler (R-HPLC (radyokromatografisi, oksidizer, phosporimager vb.) kullanılarak gerçekleştirilmiştir. Yapılan analizler; metribuzinin kökler aracılığıyla yoğun bir şekilde bitki bünyesine alındığını, metribuzinin yapraklara kadar taşındığını göstermektedir. R-HPLC analizleri sonucunda, uygulamadan 21 gün sonra kök, gövde ve yapraklarda çok sayıda farklı metribuzin metabolitleri tespit edilmiştir. Yapraklarda metribuzin ve metabolitlerinin konsantrasyonları oldukça farklılık göstermektedir. Genç yapraklarda yaşlı yapraklara göre daha fazla radyoaktivite birikimi olmaktadır. Nohutun metribuzin toleransının temelinde, kloroplastlara taşınma hızının kapasite düşük olması ve farklı yollarla yüksek detoksifikasyon kapasitesine sahip olmasıyla ilişkilendirilebilir, bu sayede aktif maddenin kloroplastlara transferi büyük ölçüde azaltılarak hedef bölgedeki metribuzin konsantrasyon kritik değerine ulaşması engellenmektedir.

Anahtar Kelimeler: *Metribuzin, Nohut, Cicer arietinum, seçicilik, tolerans, metabolizasyon, detoksifikasyon.*

Biyobozunur Ambalajların Gıdalarda Kullanımı

Yekta Gezginç, Mehmet Sakar, Betul Aylat

Kahramanmaraş Sütçü İmam Üniversitesi, Mühendislik-Mimarlık Fakültesi, Gıda Mühendisliği Bölümü, Kahramanmaraş, Türkiye

Özet

Biyobozunur ambalaj malzemeleri, plastik ambalajlara kıyasla kullanım ömürlerini tamamladıktan sonra doğaya karışarak çevre kirliliğini önleyen ve geride doğaya zararlı, zehirli maddeler bırakmayan materyallerdir. Biyobozunurluk, bir malzemenin mikroorganizmalar tarafından üretilen enzimlerle parçalanarak karbondioksit, metan, su, inorganik bileşikler ve biyokütle gibi daha basit maddelere dönüşebilmesini ifade eder. Bu dönüşüm, çevreye zarar vermeden doğal yollarla gerçekleşir. Petrol türevli sentetik ambalaj malzemeleri ise doğada uzun süre bozulmadıkları için çevre kirliliğine ve toksik madde birikimine yol açmaktadır. Bu malzemelerden kaynaklanan atıklar, çevre sorunlarını da beraberinde getirmektedir. Bu nedenle, artan çevre sorunlarını önlemek amacıyla, sentetik ambalaj malzemelerine alternatif olarak biyobozunur gıda ambalaj malzemelerinin kullanımı giderek artmaktadır. Bu malzemelerin üretiminde nişasta, selüloz, protein gibi doğal kaynaklar kullanılır. Biyobozunur plastikler, polisakkaritler, proteinler, lipitler ve polyester gibi yenilenebilir tarımsal kaynaklardan üretilebilir. Selüloz ve nişasta, doğada bolca bulunduğundan biyoplastik üretiminde önemli bir rol oynar. Protein bazlı malzemeler, polimer zincirleri arasında güçlü bağlar oluşturarak yapıyı daha dayanıklı hale getirir. Ancak, bu malzemelerin esneklik kazanması için plastikleştirici eklenmesi gerekir. Biyobazlı ve biyobozunur plastikler, yenilenebilir kaynaklardan üretilen ve aynı zamanda doğada biyolojik olarak ayrışabilen plastik türleridir. Bu durum hem çevre dostu üretim süreçleri hem de kullanım sonrası minimum çevresel etki sağlama açısından büyük bir avantaj sunar. Bu derleme ile, biyobozunur ambalajların fiziksel ve kimyasal özelliklerinin belirlenmesi ve aynı zamanda gıdalarda kullanım potansiyeli değerlendirilecektir.

Anahtar Kelimeler: *Gıda Ambalajlama, Biyobozunur, Fermentasyon, Petrol Türevleri, Atık*

Integrative Genomic and Transcriptomic Analysis of GASA Gene family in Sunflower Reveals Their Regulatory Role in Drought Stress Response

Muhammad Awais Ahmed[1], Muhammad Arshad Javed[1], Javaria Tabassum[1], Muhammad Asad Ullah[1]

[1]Department of Plant Breeding and Genetics, Faculty of Agricultural Sciences, University of the Punjab, Lahore, Pakistan

Abstract

Climate change has an outstanding impact on world agriculture. It increases both the frequency and severity of drought, reducing crop yield and compromising food security. Sunflower (*Helianthus annuus*), being a valuable oilseed crop suffers considerably by drought sress. Therefore, it is imperative to determine the genetic component that regulates its tolerance in water deficit environments in order to facilitate the production of drought-tolerant cultivars. *The GASA (Gibberellic Acid-Stimulated Arabidopsis)* gene family is known to be involved in hormone signaling, stress adaptation and growth regulation, but it's functional characterization lacks in sunflower. In the current study, we employed an integrative approach to screen and characterize the *GASA* gene family in sunflower and their roles under drought stress. Genome-wide analysis identified 27members of *HaGASA* gene family, unevenly distributed on eleven chromosomes. Phylogenetic analysis grouped the genes into five subfamilies supported by conserved motifs and structural homology with Arabidopsis, peanut, and soybean *GASA* genes. Analysis of cis-regulatory elements revealed drought and stress-responsive element enrichment with hormone and growth-related regulatory motifs. Based on transcriptomic data in the NCBI database, *HaGASA* gene expression in ten genotypes of sunflower was screened under drought. Fourteen genes exhibited differential expression under stress indicating a significant role in drought tolerance. Organ-specific expression analysis revealed *HaGASA2, HaGASA11, HaGASA17, HaGASA19, HaGASA21,* and *HaGASA26* to be dominantly expressed in the stem. This study emphasizes the *HaGASA* gene family's role in improving sunflower drought stress tolerance as well as gives preliminary insight into the genetic and regulatory processes of *HaGASA* genes that could help breed drought-tolerant sunflower varieties.

Keywords: *GASA, expression analysis, sunflower, drought*

Determination of Quality Characteristics of Cracked Wheat (Dövme) Obtained From Different Wheat Verieties

Önay Altunal, Sedat Sayar

Department of Food Engineering, Faculty of Engineering, University of Mersin, Mersin, Türkiye

Abstract

Cracked wheat is a traditional cereal product obtained from wheat grains that have been soaked and hulled. It holds a significant place in Anatolian cuisine and is particularly used in dishes such as keşkek, soups, pilafs, and salads. Due to its content of B vitamins, iron, and protein, it is considered a nutritious food source. This study aims to determine the quality characteristics of cracked wheat produced from different wheat varieties. Initially, the study focuses on identifying the quality parameters of cracked wheat. Additionally, another objective is to determine the wheat varieties most suitable for cracked wheat production. In the literature, there are numerous studies on raw material quality for various wheat-based products. However, there is a lack of detailed research on the quality characteristics of cracked wheat, which is widely used in Turkey, and on the raw material properties suitable for its production. Therefore, this study aims to contribute to the literature by providing research findings on cracked wheat production. In the study, different wheat varieties named Zivago, Bayraktar-2000, and Cumhuriyet-75 were used. These wheat varieties were processed into cracked wheat using traditional methods in a local mill. Various analyses were conducted on both the raw wheat and the obtained cracked wheat. The analyses performed on the wheat included moisture, ash, protein, total fat, hectoliter weight, thousand kernel weight, hardness, and color measurements. Meanwhile, the analyses conducted on the cracked wheat included color, hardness, cooking time, dry matter loss during cooking, starch release into water, bulk density, and sensory evaluations. Processing the wheat into cracked wheat resulted in a moisture increase of 1-4% across all varieties. For cracked wheat obtained from hard wheat, an increase in L* and b* values and a decrease in a* value were observed. Conversely, cracked wheat obtained from soft wheat exhibited a decrease in L*, a*, and b* values. According to cooking time analysis results, cracked wheat from hard wheat varieties cooked faster than those from soft wheat varieties. The dry matter loss in cracked wheat derived from hard wheat was found to be higher than that from soft wheat. The dry matter loss during cooking followed the order Bayraktar-2000 > Cumhuriyet-75 > Zivago. Finally, sensory evaluation results indicated that the Zivago variety received the highest scores in the taste parameter, Bayraktar-2000 was rated highest in external appearance, and Zivago again received the highest scores in overall acceptance. The cracked wheat sample from the Cumhuriyet-75 variety received the lowest scores in sensory tests.

Key Words: *Wheat, Cracked wheat (dovme), Hard wheat, Soft wheat, Cracked wheat (dovme) quality*

Antibacterial Effects of Imported (New Zealand) and Local Algerian Honeys Based on Botanical Origin

Mounia Homrani

University of Mostaganem, Algeria
*Crossponding author: Muhammad.asghar@upwr.edu.pl

Abstract

The overuse of antibiotics in agriculture and veterinary medicine poses significant risks to public health and the environment. Honey, known for its natural antibacterial properties, presents a potential alternative. This study evaluates the antibacterial activity of honeys based on their botanical origin. Pollen analysis was conducted following the classical method of Louveaux et al. (1978) to identify pollen grains. Physicochemical parameters (pH, moisture, hydroxymethylfurfural (HMF), and conductivity) were assessed according to Codex Alimentarius (2001) guidelines. Antibacterial activity was determined using agar diffusion assays. The analysis identified one polyfloral and five monofloral honeys from three botanical sources (*Citrus, Eucalyptus, Jujube*). Two samples were classified as honeydew honey. Most samples met quality standards regarding pH, moisture, and conductivity. Among bacterial strains, *Staphylococcus aureus* exhibited the highest sensitivity, with inhibition zones of 36.84 ± 5.52 mm for undiluted honey, decreasing to 22.92 ± 6.01 mm at a 12.5% dilution. *Escherichia coli* and *Klebsiella pneumoniae* showed slightly higher resistance, with inhibition zones ranging from 34.48 ± 4.03 mm to 21.36 ± 3.54 mm for *E. coli* and 34.68 ± 4.32 mm to 22.88 ± 4.25 mm for *K. pneumoniae*. Manuka honey and honeydew honey exhibited the strongest antibacterial activity, particularly at higher concentrations. These findings highlight the potential of honey as a natural alternative for treating bacterial infections, especially in light of rising antibiotic resistance. Manuka and honeydew honeys show promising therapeutic properties, warranting further research into their antibacterial mechanisms and medical applications.

*Corresponding author, E-mail: kohialfred2@yahoo.fr Tel: +225 09994291

Abstract

Soumbara is a fermented food condiment obtained by fermentation of nere seeds (*Parkia biglobosa*). Soumbara, like all traditional food condiments, once produced is sold in informal markets where hygiene conditions are not respected. The objective of this study was to identify microbiological hazards in soumbara sold on the market in Abidjan in order to ensure the health safety of consumers. For this study, 375 samples of soumbara were analyzed. Microbiological analyses focused on the search for spoilage and pathogenic germs as well as the search and quantification of mycotoxins. The results showed that the loads of mesophilic aerobic germs varied from $(3.1\pm0.9).10^5$ CFU/g to $(5.3\pm0.3)10^6$ CFU/g. As for the *Staphylococcus aureus* load, it varied from $(1.0\pm0.3)10^4$ CFU/g to $(3.2\pm0.5)10^5$ CFU/g. For molds, the load ranged from $(1.2\pm0.1)10^3$ CFU/g to $(4.8\pm0.2)10^3$ CFU/g. *Bacillus spores* ranged from $(1.9\pm0.7)10^4$ CFU/g to $(9.9\pm0.8)10^4$ CFU/g. *Staphylococcus* loads in soumbara were higher than the maximum acceptable value 100 CFU/g, standard 2005/2073/EC. In the analyzed samples aflatoxins and Zearelanone were detected. The results of mycotoxins detected in soumbara were below the standard EC/1881/2006. *Aspergilus, Fusarium, Penicelium* and *Stachybotrys, Mucor, Rhizopus, Bacillus cereus, Bacillus spp, Bacillus subtilis, Staphylococcus aureus, Staphylococcus spp, Bacillus anthracis* were detected in the samples analyzed. All samples analyzed did not contain *Escherichia coli, Clostridium perfringens* and *Salmonella spp*. Consumption of soumbara sold on the market could constitute a danger for the consumer.

Abstract

Feeding different substitution levels of Noug seed cake with ensiled brewery spent grain on milk yield and milk composition of crossbred dairy animals and its net benefit was done at Adami Tulu Agricultural Research Center on Ten early lactating crossbred dairy cows (HF with Arsi) with an average daily milk yield of 5.04 liter and 272.5 kg body weight were selected from nucleus herd at dairy farm. They were randomly assigned to 5 x 2 Latin Square Design composed of five dietary treatments. Each period being split to 15 days of adaptation and 15 days of measurement. The experiment was conducted from January 2024 to June 2024. Concentrate feed Noug seed cake and Wheat bran was purchased from Adama suppliers and brewery spent grain was purchased from nearby local suppliers. Brewery spent grain was allowed to cool under aerated shade for 24 hrs then manually pressed and packed into airtight plastic drum without any preservatives. Rhodes grass hay produced at on station was used as basal diet. The substitution has four levels and compared with previously recommended ration for lactating crossbred cows. The dietary treatments were T1= 66 % wheat bran + 33 NSC + 1% salt (Control), T2= 66 % wheat bran + 24.75 NSC+8.25 BSG + 1% salt, T3= 66 % wheat bran + 16.5 NSC+16.5 BSG + 1% salt, T4= 66 % wheat bran + 8.25 NSC+24.75 BSG + 1% salt and T5= 66 % wheat bran + 33 BSG + 1% salt. Daily feed offered and refused, milk yield and body weight change per 15 days, milk composition at initial and end of each feeding period were collected. The result reveals that the total dry matter intake and body weight gain doesn't differ among the treatments. The milk yield and composition of lactating animals fed feeds with varying amounts of brewery spent grain did not differ significantly. The highest net benefit was obtained from animals fed on dietary treatment 5(100%) replacement of Noug seed cake by ensiled brewery spent grain which was 272.4 ETB/cow/day. Dietary treatment 5 (wheat bran + Brewery spent grain+ salt) was recommended for further evaluation and intervention at on farm level for dairy producers who kept crossbred cows and have access for brewery spent grain especially for urban and peri urban dairy producers.

Key words: *Brewery spent gain, early lactating, crossbred cows, net benefit*

Introduction

In Ethiopia, the major constraint for low productivity of dairy cows is the shortage of livestock feeds in terms of quantity and quality, especially during the dry season (Ahmed *et al.*, 2010). Agro-industrial by-products such as flour mill and oil extracting factories by-products have been widely used as energy and protein supplements in ruminant ration (FAO, 2012).

The rising cost of agro-industrial by-products, especially oil seed cakes such as groundnut and noug seed cake made it less reliable (Goswami *et al.*, 2013). Therefore, it is imperative to search for cheap, nutritious and easily available non-conventional feed resources.

With the increasing cost of concentrate feeds and growing demand for dairy products, alternative feedstuffs have become a great necessity in the dairy industry. Due to the rapid expansion of brewery factories and their environmentally friend nature, brewery by-products have become an option for dairy managers looking for alternative feedstuffs (Bell *et al*, 2012).

In Ethiopia, there were 12 beer factories producing an estimated 26,722.8 tons brewery spent grains (SBGs) on DM basis and 360,758.1 hectoliter (hl) of brewery spent yeast (BSY) in 2016 that can be used as animal feed (Amare, 2016). It was reported by Alvarez Aranguiz *et al*. (2019) that the BSG produced can be enough to feed 60,000 cows with 10 kg/day throughout the year. The average price of spent brewery grain is still very attractive compared with other available feed (Alvarez Aranguiz *et al*., 2019).

Wet brewery grain is a good source of protein with a crude protein content that ranges from 25 to 34% (Thomas *et al.*, 2016). The protein is mainly placed in the germ portion of the spent grain and is digested to a partial amount in the rumen and to a greater amount in the small intestinal tract. The concentration of rumen degradable protein ranges from 28-43% (mean 35%), indicating that wet brewery grains are good sources of rumen un-degradable, or "bypass-protein" and it has 20-32 % dry matter (Thomas *et al.*, 2016). Feeding wet brewery spent grain to dairy

cows is a worthwhile opportunity for dairy farmers to offer additional rumen un-degradable protein and energy to dairy cows, with equal or enhanced milk production (Zanton, 2016).

Ensiling of wet brewery grain either alone or along with other feed is ecologically and economically feasible, and easily applicable from a technological viewpoint to dairy farmers in Ethiopia. The selection of the right conservation method is crucial for storing and utilizing this feed without spoilage.

In Ethiopia most of previous studies done on wet BSG mainly focus on mechanism of extending shelf life but the rate at which the feed to be included in the ration of dairy cattle not yet studied (Alvarez Aranguiz *et al*. 2019; Getu, 2019). The study was conducted to address the following objectives:

Objectives

- To evaluate the effect of feeding different substitution levels of Noug seed cake with ensiled brewery spent grain on milk yield and milk composition of crossbred dairy animals
- To evaluate the net benefit of feeding different substitution level of ensiled brewery spent grain in the ration of crossbred dairy animals

Materials and methods

Description of the study area

The study was conducted at Adami Tulu Agricultural Research center located at 167km south of Addis Ababa at latitude of 70 9' N and 3807'E longitude in semi-arid middle rift valley of Ethiopia. The area is situated 1500 meters above sea level and the soil type of the area is fine, sandy loam with sand, clay in the proportion of 34:48:18 respectively. The average annual rainfall is 760mm. The minimum and maximum temperature are 12.6 and 27^0c, respectively (ATARC, 2003).

Experimental feed preparation

The concentrate mix was prepared based on the recommendation of dairy animals' nutrient requirement (Kearl, 1982; ARC, 2001). The concentrate mix was formulated to furnish 12 MJ of energy per kg of feed and to contain 20 % total protein. Furthermore, feed provision was adjusted fortnightly depending on milk production of the animals. As wheat bran is the most common source of energy and sustainably available, it was used as a source of energy while noug cake was used as protein source. The roughages were provided ad libitum adjusted to 10% refusal daily from the previous day offer on a DM basis. Studies in Ethiopia have revealed that the daily concentrate allowance can be calculated at the rate of 0.5 kg/liter of milk and can be offered twice a day in the morning and afternoon hours. Water was available free of choice.

Brewery spent grain Ensiling/preserving methods used:

Simple ensiling methods were used. Brewery spent grain was ensiled alone. Fresh brewery spent grain was acquired from local suppliers and stored under shade for 24hrs at room temperature which allows to cool brewery spent grain. After 24hr brewery spent grain were stored in airtight plastic drum. A quintal of brewery spent grain divided into three portions and compressed manually by using human labor into 400-liter plastic water drum to keep airtight and the procedure repeated until the drum filled at its full capacity. We took daily the amount required and kept closed the plastic drum.

Feed offered and refusals were measured and recorded for each cow daily to determine the dry matter as a difference between the offered and refused feed for both silage, roughage and concentrate mix. Body weight measurements were taken for each dietary treatment over two consecutive days at the beginning and end of each period using weighing scale. The animals were made to fast overnight and body weight measurements were taken at 06:00A.M before feed and water being served to the animals. The cows were hand-milked twice a day in the morning and afternoon at (6:00 am and 6:00Pm) and milk yield will be measured using graduated plastic cylinder and recorded for each animal.

Experimental design and animal management

Ten early lactating crossbred dairy cows (Holstein Frisian with Arsi) with an average daily milk yield of 5.04 liter and 272.5 kg average body weight were selected from ATARC dairy farm. All experimental animals were treated for internal and external parasites before feeding started. Animals were assigned to one of the dietary treatments randomly. They were randomly blocked in 5 x 2 Latin Square Design composed of five dietary treatments. Each period being split to 15 days of adaptation and 15 days of measurement. The experiment was conducted from January 2024 to June 2024. The cows were individually stall-fed in well-ventilated houses/barns with well dried floors and appropriate drainage slope and gutters.

Milk composition analysis

Milk composition was analyzed by collecting milk samples at initial and at end of each feeding period. Milk samples (100 ml) from the morning and evening milking were collected in sterile plastic containers. Composite samples were used for analysis of milk composition. Milk sample was analyzed by using a Lactoscan milk analyzer for milk fat, protein, lactose total solids and pH.

Chemical composition of experimental ingredients used

Table 1. Chemical composition (% DM) and metabolizable energy (MJ/kg DM) contents of experimental feed ingredients

Feeds offered	DM	OM	CP	NDF	ADF	Lignin	ME (MJ Kg^{-1} DM)
Noug seed cake	92.2	89.08	32.1	34.7	26.7	7	9.5
Brewery spent grain	94.1	93	26.9	63.2	24	5	10.3
Wheat bran	90.5	95.7	17	38.2	9.4	2.54	11.7

Treatments

T1= 66 % wheat bran + 33 NSC + 1% salt (Control)
T2= 66 % wheat bran + 24.75 NSC+8.25 BSG + 1% salt
T3= 66 % wheat bran + 16.5 NSC+16.5 BSG + 1% salt
T4= 66 % wheat bran + 8.25 NSC+24.75 BSG + 1% salt
T5= 66 % wheat bran + 33 BSG + 1% salt

Data analysis

Collected data were coded and processed into MS excel and analysis was done undertaken using the GLM procedure of SAS (SAS, 2009). Significance level was tested at $P < 0.05$.

Partial budget analysis

The partial budget analysis and net return were calculated to determine the profitability of the four different supplemental feeds that were fed to the lactating cows under on station management conditions. According to (Ehui *et al*., 1992) Net income (NI) is calculated as the amount of money left when total variable cost (TVC) is subtracted from total returns (TR). In this experiment the variable costs included estimated purchase price of the basal and supplemental feed cost and labor cost for preparation of the supplemental feed and cost for medicaments and treatments. While total return (TR) was estimated average sale price of milk produced during the experimental period per animal per day within treatment (NI= TR- TVC). Change in net income (ΔNI) was computed as the difference between change in total return (ΔTR) which was total return of the given treatment minus total return of the control treatment (T1) and change in total variable cost (ΔTVC) Total variable cost of the treatment minus total variable cost of the control. $\Delta NI = \Delta TR - \Delta TVC$.

Results and Discussions

Feed intake

The result indicates that the total dry matter intake and body weight gain doesn't differ among the treatments. It is in line with the findings of Christa L M., 2010 who replaced brewery spent grain with corn silage in the diet of lactating cows in which the dry matter intake was not different across the treatments.

The current result is contradicting with the findings by Getu K. *et al.* in 2019 who reported the total DM and body weight of the animals decreased as the level of BSG substitution increased. The difference might be due to the blood level of crossbred cows used for the experiment where they use high grade crossbred cows.

The result was inconsistent with the findings of AL-Talib *et al.*, 2014 who reported significant improvement in amount of concentrate feed intake in increasing levels of dried brewery grain in feeding lactating dairy cows. The difference might be attributed by the type of brewery grain used as they use dried one.

Table 2. Mean (±SE) feed intakes of HF x Arsi crossbred cows fed on different levels of brewery spent grain substitute Noug seed cake protein sources

Parameters	Treatments					Sig
	T1	T2	T3	T4	T5	
Feed offered (kg/day)	8±0	8±0	8±0	8±0	8±0	Ns
Feed leftover (kg/day)	.4±.1	.6±.1	.6±.2	.8±.1	.7±.1	Ns
Feed intake (kg/day)	7.6±.1	7.4±.1	7.4±.2	7.2±.1	7.3±.1	Ns

Milk production and Composition

The findings showed that the daily milk output of lactating F1 HF X Arsi cows did not significantly differ across the treatments which is consistent with the findings of Christa L M., 2010 who replaced brewery spent grain with corn silage in the diet of lactating cows. The table shown below shows the average daily milk yield per cow, with an overall mean of 7.5 ± 0.2 liters per cow. The results contradict the findings of Getu K *et al.,* 2019and Endale Y *et al.,* 2024, which showed that milk output increased with an increase in the amount of brewery leftover grain included. The result was inconsistent with the findings of AL-Talib *et al.,* 2014 who reported milk yield were highly significant among the milking Frisian cows feeding different levels of dried brewery grain. The difference might be due to the difference in the form of brewer grain used as we use fresh ensiled brewery spent grain.

Our findings suggested that spent brewery grain can replace the Noug seed cake in the feed of lactating F1 HF X Arsi cows without reducing milk yield. This result is consistent with that of Getu K. *et al.,* 2019 and Endale Y *et al.,* 2024, who discovered that crossbred dairy cows' diets may incorporate brewery spent grain in place of the protein source present in oilseed cake.

The findings showed that the milk composition of lactating animals fed feeds with varying amounts of brewery spent grain did not differ significantly. The result is consistent with findings of Endale Y. *et al.,* 2024 who reported the composition of milk remain unchanged except the fat which exhibited a declining trend. The outcome differed with the research conducted by Getu K. *et al.,* in 2019, who found that the replacement levels of ensiled BSG to cotton seed cake varied in their reports' effects on milk composition. The observed variation in the protein source feed could potentially be attributed to the substitution of brewery spent grain.

In contrast to the current result AL-Talib *et al.,* 201 reported milk composition of the milking Frisian cows feeding different levels of dried brewery grain were highly significant. The difference might be due to the difference in the form of brewer grain used as we use fresh ensiled brewery spent grain.

Table 3. Milk yield and composition of crossbred cows fed on different levels of brewery spent grain substitute Noug seed cake protein sources

Variables	Treatments						
	T1	T2	T3	T4	T5	SEM	P value
Milk yield Kg/day	7.5	7.37	7.67	7.47	7.64	0.44	0.98
Fat %	4.14	4.25	4.07	3.98	4.01	0.20	0.95
Protein %	3.09	3.16	3.17	3.14	3.15	0.05	0.45
Lactose %	4.67	4.74	4.71	4.72	4.74	0.07	0.82
SNF %	8.45	8.68	8.59	8.62	8.63	0.14	0.16
pH	6.45	6.43	6.51	6.46	6.42		0.80
BW (Kg)	292.5	293.3	289.6	294.0	293.8	11.2	0.99

Partial budget analysis

Partial budget analysis indicated that the net benefit is high for animals receiving dietary treatment 5 (100%) replacement of Noug seed cake by ensiled brewery spent grain followed by treatment 3 and 4. The current result is similar with the findings of Endale Y. *et al.* (2024), who reported that the net benefit was high for cows receiving the highest inclusion rate of brewery spent grain. The highest net benefit was obtained from animals fed on dietary treatment 5 which was 272.4 ETB/cow/day.

Table 4. Partial budget analysis of crossbred cows fed on different levels of brewery spent grain substitute Noug seed cake protein sources

Variables	Treatments				
	T1	T2	T3	T4	T5
Milk yield (lit/cow/d)	7.5	7.4	7.7	7.5	7.6
Gross benefit (ETB /cow/d)	450.0	442.2	459.0	448.2	458.4
Cost of BSG (ETB/cow/d)	0.0	3.7	7.5	11.2	14.9
Cost of NSC (ETB/cow/d)	47.5	35.6	23.8	11.9	0.0
Cost of wheat bran (ETB/cow/d)	60.7	60.7	60.7	60.1	60.1
Cost of common salt (ETB/cow/d)	1.0	1.0	1.0	1.0	1.0
Cost of Rhodes grass hay (ETB/cow/d)	60.0	60.0	60.0	60.0	60.0
Labor cost (ETB /cow/d)	50.0	50.0	50.0	50.0	50.0
Total variable cost (ETB /cow/d)	219.4	211.1	202.9	194.1	186.0
Net benefit (ETB /cow/d)	230.6	231.1	256.1	254.1	272.4

Note: WB: 23ETB/Kg, NSC: 36 ETB/kg, BSG: 11.3ETB/kg, Hay: 15ETB/Kg, salt: 25ETB/kg, Milk: 60ETB/liter

Conclusions and Recommendations

Overall, incorporating BSG into dairy cow diets can be beneficial for both milk production and farm economics, but it requires careful management to ensure consistent supply and proper adaptation.
Inclusion of brewery spent grain in diet of lactating crossbred cows has no negative effect on milk yield and composition.
The highest net benefit was obtained from animals fed on dietary treatment 5 which was 272.4 ETB/cow/day.
Ensiled brewery spent grain can substitute biological and economical protein source noug seed cake in the diet of lactating crossbred dairy cows without affecting milk yield and composition.
Based on partial budget analysis, Dietary treatment 5 (wheat bran + Brewery spent grain+ salt) was recommended for further evaluation and intervention at on farm level for dairy producers who kept crossbred cows and have access for brewery spent grain especially for urban and peri urban dairy producers.

Foxtail Millet *Setaria italica* (L.): Acceptability of Indigenous Food Products Among the Mindanaoans, Philippines

Raquel Oclarit-Salingay, Agripina Rana-Aradilla, Nenita B. Baldo, Ma. Stella M. Paulican

Department of Agronomy and Plant Breeding, Central Mindanao University, University Town, Musuan, Bukidnon, Philippines

Abstract

Foxtail millet (*Setaria italica* (L.) P. Beauv.) is one of the indigenous food crops in the Philippines. It is a marginalized cereal crop known for its climate resiliency and nutritional properties. Along with the green revolution and change in crop production preferences, it is left uncirculated thus regarded as a nearly forgotten crop. This study was conducted to assess the acceptability of traditional food products derived from foxtail millet as identified by foxtail millet growers in Northern Mindanao. Four traditional food products were prepared, namely: "dawacaldo", "biko", plain porridge, and "puto". These food products were subjected to sensory evaluation by 60 respondents of different age brackets using a 9-point Hedonic rating scale. Among the evaluators, 72% had no knowledge about the crop. Frequency counts, mean, standard deviation and one-way ANOVA were used to analyze the data gathered. Significant differences between treatment means were determined using the Least Significant Difference (LSD) Test. Results revealed that the four food products derived from foxtail millet were "liked very much" to "liked extremely" by evaluators across age groups. Nevertheless, "*dawacaldo"* was the most preferred among the products served to them. Dawacaldo is an enriched porridge with addition of chicken and herbs that improved its total acceptability. Thus, this food product was highly acceptable by the community. Yet, there is a dire need for reintroduction of foxtail millet in the Philippines and the commercialization of its food products.

Abstract

This experiment aimed to evaluate the antioxidant potentials of sweet orange, shaddock and lemon peel extracts as an alternative source of synthetic antioxidants like butylated hydroxyanisole (BHA), butylated hydroxytoluene (BHT) and tertiary butyl hydroquinone (TBHQ) often used in food industries to enhance the oxidative stability of food products. The peels of ripe sweet orange, shaddock and lemon fruits were oven-dried and extracted using a standard method. The qualitative and quantitative phytochemical contents, radical scavenging activities and 1,1 – diphenyl 2- picrylhydrazyl (DPPH) abilities of sweet orange peel extract (SOPE), shaddock peel extract (SHPE), and lemon peel extract (LMPE) were also evaluated. Phenolic compounds, steroids, flavonoids, coumarins triterpenes and alkaloids were found in SOPE, SHPE and LMPE. While phlobatannin, anthocyanin and amino acid were observed to be absent in SOPE, SHPE and LMPE. SOPE contains more steroids (34.43 mg/100g), flavonoids (161.82 mg/100g), terpenoids (17.09 mg/100g), triterpenes (128.27µg/100g) and alkaloids (32.44 mg/100g) than SHPE and LMPE. SHPE contains more phenolics (26.76 mg/100g) than SOPE and LMPE while LMPE contains more tannins (1.74 mg/100g), coumarins (18.15 µg/100g) than SOPE and SHPE. The study showed that SOPE, SHPE and LMPE contains useful natural antioxidants that can serve as alternative preservative agents and antioxidants to butylated hydroxyanisole (BHA), a synthetic antioxidant.

Introduction

Varieties of fruits are in abundance in Nigeria, to which after consumption, its peels constitute a nuisance as wastes and potential hazard to the environment. Specifically, peels of the fruits which, when accumulated over time, may, through runoff pollute potable water, stream and rivers or become a hideout for poisonous reptiles and insects (Manthey and Grohmann, 2001). Consequently, a considerable amount of money and time is spent disposing of peels as a waste product. Hence, any processes that will convert these wastes to useful end-products will not only be obtaining a valuable product from a cheap and readily available source but also help in recycling waste.

Phytochemical studies of several fruits showed that phenolic compounds like phenolic acids, flavonoids, glycosides, , and alkaloids, are much more concentrated in the peels than the fruit pulp (Lucia et al.,2008; Ignat et al., 2011). The phytochemicals are extracted from the peels using alcohols by procedures described by some researchers (Calabro et al., 2004; Sultana et al., 2009; Van Acker et al., 2011). The phytochemicals may contain both beneficial (antioxidants) and anti-nutritional compounds. Some compounds like saponins, phenolics, alkaloids, glycosides and tannins are examples of anti-nutritional compounds that inhibit both animal and human growth, also impair intake and utilization of food and feeds (Pihlanto et al., 2017). Despite their anti-nutritional effect, these compounds can also be beneficial in their activities. For example, tannins and phytic acids while being anti-nutrients, may also have beneficial effects on humans in the treatment and prevention of many pathological conditions and cancer (Silva and Bracarense, 2016). Saponins may contain a plasma cholesterol-lowering effect, which is important in reducing the risk of some chronic diseases in humans (Singh et al., 2017). Glycosides and their related hydrolytic products are believed to reducing the risk of chronic diseases like cardiovascular diseases and various forms of cancer and inflammatory disorders (Jaafaru et al., 2018). It has been observed that human bodies under stress conditions produce less enzymatic antioxidants like superoxide dismutase (SOD), glutathione peroxidase (GPx), and catalase (CAT) and non-enzymatic antioxidants like ascorbic acid (vitamin C), tocopherol (vitamin E) (Manjula and Ammani, 2012). An imbalance in the above activities could damage the body cell and other health challenges (Steer et al., 2002).

Fruit peels contain lots of free radical scavenging molecules some of which include alkaloids, vitamins, terpenoids, phenolic acids and tannins as well as other secondary metabolites with a high level of antioxidant activity (Manjula and Ammani, 2012). Most phytochemicals are natural antioxidants and can be used as an alternative to synthetic antioxidants like butylated hydroxyanisole (BHA), butylated hydroxytoluene (BHT) and tertiary butyl

hydroquinone (TBHQ) which essentially reduce the damages caused in tissue during physiological processes (Ignat et al., 2011). This research was aimed at determining the qualitative and quantitative phytochemical components in the peels of some of the important fruits in Nigeria, like sweet orange, shaddock and lemon, as indices of producing secondary plant metabolites which have antioxidant values as well as application in food industries.

Materials And Methods

Materials

Ripe sweet oranges (*Citrus sinensis)*, shaddock (Citrus maxima), and lemon (*Citrus limon*) fruits were collected from the Lower Niger River Basin Authority farm, Ilorin, Kwara State. The materials used are; Sieve with diameter 142.56 µm, Soxhlet apparatus, Knives, Rotary evaporator dark bottles, and fridge. Chemicals include; Folin-ciocalteu reagents, ethanol, aluminum chloride was used in this study.

Methods

Preparation of the extracts of sweet orange peel (SOP), shaddock peel (SHP), and lemon peel (LMP)

The experiment was carried out in the School of Agriculture and Agricultural Technology, Animal Production Laboratory, Federal University of Technology, Minna. Agricultural Laboratory of Kwara State University, Malete, Nigeria and Central Research laboratory, Tanke, Ilorin, Nigeria Ripe sweet orange, shaddock, and lemon fruits were washed with water, peeled manually using a stainless-steel knife, and edible parts separated. The peels were oven-dried (using Gallenhamp oven, 300 plus series model) at 40 ^{O}C for 48 hours. The dried samples were ground to a fine powder using a blender (Smart Leaf VTCL, 18,000 rpm capacity, India) and passed through a 24 mesh-size sieve (142.56µm) according to the method described by Van Acker et al. (2011). The organic solvent extraction method was used to extract the phenolic compounds. A total of 50 g of each of the powdered samples were extracted with 400 ml ethanol at room temperature by the soxhlet extraction method for 3 hours. The mixture was decanted to remove the debris. The extraction procedures were repeated twice under the same condition to ensure complete extraction

Finally, the extracts were filtered and evaporated to dryness under reduced pressure at 60 ^{0}C by a rotary evaporator (RE-52A Model, England). The extracts were then kept in the dark bottles and stored in the refrigerator at 4 ^{0}C for 48 hours.

Qualitative analysis of the phytochemicals of the extracts

Test for tannins

Analysis used was the method reported by Ejikeme et al. (2014). About 0.03 g of each extracted samples was weighed into a test tube and boiled for 10 minutes in a water bath containing 30 cm^3 of water. The contents were filtered after boiling using number 42 (125 mm) Whatman filter paper.1 cm^3 of freshly prepared 10% potassium hydroxide (KOH) was added to 1 cm^3 of the extract samples. A dirty white precipitate indicates the presence of tannins.

Test for phlobatannins

About 0.30 g of each extract sample were weighed into a beaker containing 30 cm^3 of distilled water. 10 cm^3 of each sample were measured and boiled with 5 cm^3 of 1% aqueous hydrochloric acid (HCL). A red precipitate indicates the presence of phlobatannins (Ejikeme et al., 2014).

Test for saponin

About 30 cm^3 of distilled water was added to 0.30 g of each extract sample and boiled for 10 minutes in a water bath after which were filtered using Whatman filter paper number 42 (125 mm). A mixture of 5 cm^3 distilled water and 10 cm^3 of the filtrate was agitated vigorously until froth was observed. The formation of emulsion on the addition of 3 drops of olive oil indicates saponin (Ejikeme et al., 2014).

Test for steroid

About 0.30 g of each of the extract samples were weighed into a beaker and diluted with 2 cm^3 acetic anhydride followed by 5 drops of concentrated tetraoxosulphate (VI) acid (H_2SO_4). A red colour change in the sample(s) indicates steroids (Ejikeme et al., 2014).

Test for terpenoids

About 5 ml of aqueous extract of the samples was mixed with 2 ml of $CHCL_3$ in a test tube and 3 ml of concentrated tetraoxosulphate (VI) acid (H_2SO_4) was carefully added to the mixture to form a layer. An interface with a reddish-brown colouration indicates the presence of terpenoids (Ejikeme et al., 2014).

Test for flavonoids
About 1 cm^3 of 10% sodium hydroxide (NaOH) was added to 3 cm^3 of each aqueous extract sample. An intense yellow colour appeared which became colourless with the addition of a few drops of dilute acid which indicates the presence of flavonoids (Muhammad and Amzad, 2014).

Test for alkaloids
About 1 cm^3 of 1% hydrochloric acid (HCl) was added to 3 cm^3 of each extract sample in a test tube. The mixtures were then heated for 20 min, cooled and filtered using Whatman filter paper number 42 (125 mm). About 2 drops of Wagner's reagent were added to 1 cm^3 of the filtrates. A reddish-brown precipitate indicates the presence of alkaloids (Rufai et al.2016).

Test for glycoside
About 10 cm^3 of 50 % tetraoxosulphate (VI) (H_2SO_4) was added to 1 cm^3 of the extract samples. The mixtures were then heated in boiling water for 15 min. 10 cm^3 of Fehling's solution was added and the mixture boiled for another 10 min. A brick red precipitate indicates the presence of glycosides (Rufai et al. 2016).

Test for phenolics
About 2 drops of 5 % iron chloride ($FeCl_3$) was added to 1 cm^3 in each of the test tube containing the extract samples. A greenish precipitate indicates the presence of phenols (Kun-ze et al. 2018).

Test for coumarins
About 0.5 g of the peel extracts of sweet orange, shaddock, and lemon fruits was covered with filter paper moistened with 1 M of sodium hydroxide (NaOH) in a small test tube. The test tube was immersed in boiling water bath. The filter paper was removed and examined in ultraviolet light for yellow fluorescence which indicates the presence of coumarin (Kalpana et al. 2014).

Test for triterpenes
About 5 drops of acetic anhydride were added to 1 cm^3 of the extract's samples. A drop of concentrated sulphuric acid (H_2SO_4) was later added, and the mixture was steamed for 1 hr. and subsequently neutralised with sodium hydroxide (NaOH), then with chloroform added to the solution. A blue-green colour indicates the presence of triterpenes (Katrizky, 1995).

Quantitative analysis of the phytochemicals of the extracts
Total tannin content determination
About 0.20 g of the extract samples were measured into a 50 ml beaker containing 20 ml of 50 % methanol, which was later covered with paraffin and boiled in a water bath at 77 – 80^o C for an hour. The contents were thoroughly shaken and filtered using a double-layered Whatman number 41 filter paper into a 100 ml volumetric flask. 20 ml of water, 2.5 ml of Folin-Denis reagent and 10 ml of 17 % sodium carbonate (Na_2CO_3) were added into the content in the volumetric flask and mixed properly. More quantity of water was added into the mixture in the volumetric flask up to the mark and allowed to stand for 20 min., after which a bluish-green colour was observed. 0 – 10 ppm was produced following the above procedure as a 1 ml blank sample. The absorbance readings of the tannic acid standard solution and the samples were read after colour development on a Spectronic 21D spectrophotometer at a wavelength of 760 (Amadi et al. 2004). Total tannin was calculated using the formula:

$$Total\ tannin = absorbance\ x\ average\ gradient\ x \frac{dilution\ factor}{wt\ of\ sample}$$

Total saponin content determination
About 1 g of the extract samples were weighed into a 250 ml beaker, and 100 ml of isobutyl alcohol was added. The contents were shaken on a UDY shaker for 5 hr. to ensure uniform mixing. The contents were then filtered through a Whatman number 1 filter paper into a 100 ml beaker containing 20 ml of 40 % saturated solution of magnesium carbonate ($MgCO_3$). The obtained mixtures were again filtered to get a clear colourless solution. About 1 ml of the filtrates were pipette into a 50 ml volumetric flask containing 2 ml of 5 % iron chloride ($FeCl_3$) solution and distilled water was added to make up to the mark level of the flask. The contents in the flask were allowed to stand for 30 min for a blood-red colour to develop. 0 – 10 ppm saponin standard was prepared and treated with 2 ml of 5 % iron chloride ($FeCl_3$) following the same procedure described earlier. The absorbance of the samples and standard saponin solution was read after colour development using a Jenway V6300 spectrophotometer at a wavelength of 380nm (Ejikeme et al. 2014). The quantity of saponin was calculated as follows:

$$Total\ saponin = absorbance\ x\ average\ gradient\ x \frac{dilution\ factor}{weight\ of\ sample\ x\ 10{,}000}$$

Total steroid content determination

About 0.05 g of extract samples were weighed into a 100 ml beaker. Chloroform – methanol (2 ml) with a ratio of 2:1 was added, and the content was shaken for 30 min to dissolve the extract samples. 1 ml of the content was pipette into a 30 ml test tube containing 5 ml of alcoholic potassium hydroxide (KOH) and shaken thoroughly until a homogenous mixture was obtained. The mixture was then placed in a water bath at 37° C - 40° C for 1 hr. 30 min. The contents were cooled to room temperature and 10 ml of petroleum ether was added with 5 ml of distilled water. The content was later evaporated to dryness on the water bath. 6 ml of Liebermann Buchard reagent was added to the residue in a dry bottle, and absorbance reading was taken on Spectronic 21 D digital spectrophotometer at a wavelength of 620nm. A standard solution of 0 – 4 mg/ml was prepared and followed the same procedure earlier described by Chukwuma and Chigozie (2016). Total steroid content was calculated as follow:

$$Total\ steroid = absorbance\ of\ sample\ x\ average\ gradient\ x \frac{dilution\ factor}{weight\ of\ sample\ x\ 10.000}$$

Total terpenoid content determination

Liquid chromatography-electrospray ionization – mass spectrometry method described by Feng et al. (2013) was used. 0.5 g of the extracts were mixed with 0.03 % formic acid aqueous solution in 45 min. The chromatographic separations were achieved on an Agilent Poroshell SB-C_{18} column (150x 4.6mm, 3.5 µm) with gradient elution using acetonitrile. Detection was performed in the positive ionization mode by monitoring the precursor-extract combination.

Total flavonoid content determination

Total flavonoids of the peel extract samples were determined using the aluminum chloride colorimetric assay method (Calabro et al.2004; Ebrahimzadeh et al. 2008). About 1 ml of the extract samples and 500 µg/ml standard solution of quercetin were added to a 10 ml volumetric flask containing 4 ml of distilled water. After that, 0.3 ml of 5 % sodium nitrite ($NANO_2$) was added. 5 min after, 0.3 ml of 10 % aluminum chloride ($AlCl_3$) was added. 6 min later, 2 ml of 1 M sodium hydroxide (NaOH) was added and distilled water was added to make up the total volume of the content to be 10 ml. The content was mixed thoroughly and the absorbance reading of the colorimeter was measured against the prepared reagent blank at 510 nm. The total flavonoid content of the samples was measured as mg of quercetin equivalent per 100 g of fresh content.

Total alkaloid content determination

The quantitative determination of alkaloids was done by the procedure described by Hikino et al. (1984). About 2 g of the extract samples were weighed into a 100 ml beaker and 20 ml of 80 % alcohol was added to give a smooth paste. The resulting content was poured into a 250 ml round bottom flask and more alcohol was added together with 1 g of magnesium oxide. The mixture was then digested in a boiling water bath for 1 hr. 30 min under a reflux air condenser and occasionally shaken the content. The mixture was filtered while still hot through a Buchner funnel. The residue was transferred into the flask and re-digested for another 30 min with 50 ml alcohol and the alcohol evaporated later. Three drops of 10 % hydrochloric acid (HCL) were added. The entire content was later poured into a 250 ml volumetric flask. About 5 ml of zinc acetate and 5 ml of potassium ferricyanide solution were mixed thoroughly to give a homogenous solution. The content in the flask was allowed to stand for a few minutes, filtered through a dry filter paper and 10 ml of the filtrate was poured into a separating funnel and the alkaloids in the content extracted vigorously by shaken with portions of chloroform five times. The residue collected was dissolved into 10 ml of hot distilled water and poured into a Kjedahl tube with a solution of 0.2 g of selenium for digestion to form a colourless solution. The clear colourless solution was used to determine the nitrogen using the Kjeldahl distillation apparatus. The distillate was later back titrated using 0.01 mole hydrochloric acid (HCl), and the titre value obtained was used to calculate the percentage nitrogen as follow:

$$\%\ N = titre\ value\ x\ atomic\ mass\ of\ nitrogen\ x\ normality\ of\ HCl\ x \frac{100}{weight\ of\ sample}$$

% Alkaloid = % Nitrogen × 3.26 where 3.26 is a constant

Total glycoside content determination

About 10 ml of extract samples were pipette into a 250 ml conical flask. 50 ml of chloroform was added and mixed thoroughly on a Vortex mixer for an hour. The sample mixtures were filtered into a conical flask, and 10 ml of pyridine with 2 ml of 2 % sodium nitroprusside were added and shaken for 10 min. Three ml of 20 % sodium hydroxide (NaOH) was subsequently added to develop a brownish yellow colour. Glycoside standards ranging from 0 – 5 mg/ml were prepared from 100 mg/ml stock glycoside following the procedure earlier discussed. The absorbance of samples, as well as standard, were read on a spectronic 21 D digital spectrophotometer (Thermo

Milton Roy, number 49983-1, France) at a wavelength of 510 nm (Amadi et al., 2004). The total glycoside of each of the extract samples was calculated as follow:

$$Total\ glycoside = absorbance\ of\ sample\ x\ average\ gradient\ x \frac{dilution\ factor}{wt.of\ sample\ x\ 10{,}000}$$

Total phenols content determination

The total phenolic content of the samples was determined using the method described by Talari et al. (2012). The aliquots of the extract samples were poured into a test tube with distilled water added to it to reach a volume of 1 ml. A quantity of 0.5 ml Folin-Ciocalteu reagent (1:1 with water) together with 2.5 ml 20 % of a sodium carbonate solution was sequentially added into the test tube. After the vortex of the reaction mixture, the test tubes were placed in the dark cupboard for 40 min. The absorbance of the solutions was taken at a wavelength of 725 nm using a spectrophotometer (Thermo Milton Roy, number 49983-1, France) against the blank reagent. Using Gallic acid monohydrate, a standard curve was prepared. The linearity obtained was in the range of 1 – 10 µg/ml. Using the standard curve, the total phenolic content was calculated and expressed as Gallic acid equivalent in mg/g of the extracts.

Total coumarin content determination

According to the procedure described by Isabella et al. (2016). 0.5 ml of 5M of sodium hydroxide (NaOH) was added to 1 ml of the extracts and heat at 80 °C for 5 min. 0.75 ml of 5M sulphuric acid (H_2SO_4) was added into the cooled content and mixed thoroughly with 0.25 g of anhydrous $NAHCO_3$, which was later transferred to the extractor. The content was later extracted for 3 hrs. with petroleum ether. 20 ml of water was added to the petroleum ether extract and carefully evaporated the petroleum ether in a water bath at 50 – 55 °C. The aqueous solution was then transferred into a volumetric flask to the 50 ml mark and continuously mixing content. About 25 ml of the solution was pipette into a flask and add few drops of 1 % sodium carbonate (Na_2CO_3) solution and heat in a water bath at 85 °C for 15 min and cool. Add 5 ml of diazonium solution and was left to stand for 2 hrs. The absorbance was read at 540 nm against the blank reagent. The total coumarin was calculated from the standard curve derived.

Total triterpenes content determination

According to the procedure described by Pérez-Camino and Cert (1999). A quantity of 0.5 g of extract samples were weighed into a 50 ml conical flask, and 20 ml of 2:1 chloroform-methanol mixture was added, thoroughly shaken and allowed to stand for 15 min. The supernatant produced was discarded and the precipitate rewashed with 20 ml of 2:1 chloroform-methanol mixture and centrifuged. The resultant precipitate was dissolved in 40 ml of 10% sodium dodecyl sulphate (SDS) solution. 1 ml of 0.01 M ferric chloride ($FeCl_2$) solution was added to the content for intervals of 30 sec. The content was shaken thoroughly and allowed to stand for 30 min. Standard triterpenes of 0 – 5 mg/ml were prepared from 100 mg/l stock solution obtained from Sigma – Aldrich chemicals, Germany. The absorbance readings of samples and that of the standard concentrations of triterpenes were read on a digital spectrophotometer (Thermo Milton Roy, number 49983-1, France) at a wavelength of 510 nm. The total amount of triterpenes was determined using the formula:

$$Total\ tritepene = absorbance\ of\ sample\ x\ average\ gradient\ x\ \frac{dilution\ factor}{wt.of\ sample\ x\ 10{,}000}$$

1,1 – diphenyl 2- picrylhydrazyl (DPPH) determination

The DPPH ability of each of the peel extracts were monitored according to the method described by Barros et al. (2007) 1 ml of each of the extract samples was added to 4 ml of 0.1 mmol L-1 methanolic solutions of DPPH. A blank solution was obtained by mixing 4 ml of 0.1 mmol L-1 methanolic solutions of DPPH and 200 µl of deionised distilled water. After 30 min of incubation in the darkroom at room temperature, the absorbance was read at a wavelength of 517 nm using a spectrophotometer (Thermo Milton Roy, number 49983-1, France) against a prepared blank solution. Inhibition of free radicals by DPPH in percent was calculated as follows:

% DPPH inhibition = 100 – ({absorbance of sample – absorbance of blank}/ control absorbance) × 100

Statistical analysis

The data of quantitative phytochemical compounds, DPPH, and radical scavenging activities were analyzed in a completely randomized design using the MIXED procedure of SAS (SAS, 2014). Means were separated with the Tukey HSD test at a $p < 0.05$ level of significance.

Results And Discussions

Phenolic compounds in peel extracts of sweet orange, shaddock, and lemon fruits

The results of the qualitative phytochemical screening of sweet orange, shaddock and lemon peel extracts are presented in Table 1. The results showed the presence of various secondary metabolites (saponin, tannins, phenolics, steroids, flavonoids, coumarins, terpenoids, glycosides, triterpenes and alkaloids). Sweet orange peel extract (SOPE) contained saponin, phenolics, steroids, flavonoids, coumarins, terpenoids, glycosides, triterpenes and alkaloids. Shaddock peel extracts (SHPE) contained saponin, tannins, phenolics, steroids, flavonoids, coumarins, terpenoids, triterpenes and alkaloids. While Lemon peel extracts (LMPE) contain tannins, phenolics, steroids, flavonoids, coumarins, glycosides, triterpenes and alkaloids. Phlobatannin is absent in all the peel extracts. From the study, the phenolics, steroids, flavonoids, coumarins, triterpenes and alkaloids that are present in sweet orange, shaddock and lemon peel extracts, are due to the fact that practically all fruit plant tissues can manufacture phenolic chemicals in their pulp or peels (Shahidi and Naczk, 2004; Ishola et al. 2017). The findings of this study are consistent with those of Hafiz *et al*. (2020), who found polyphenol content and antioxidant potential in twenty different fruit peel samples using an ethanolic extraction method, as well as detailed characterisation and quantification using LC-MS and HPLC. In a study to investigate the qualitative presence of natural antioxidants in grape seed peels, faba bean peels, buck-wheat peels, and oil hemp seed peels, Medina (2011) discovered the presence of certain natural antioxidants in bulk wheat, grape seed peels, faba bean peels, and oil hemp seed peels.

Table1. Qualitative Phytochemical Screening of SOPE, SHPE and LMPE

Compounds	Treatments		
	SOPE	SHPE	LMPE
Saponin	+	+	-
Tannins	-	+	+
Phenolics	+	+	+
Phlobatanin	-	-	-
Steroids	+	+	+
Flavonoids	+	+	+
Coumarins	+	+	+
Terpenoids	+	+	-
Glycosides	+	-	+
Triterpenes	+	+	+
Alkaloids	+	+	+

+ = There is the presence of the phytochemicals; = Absence of the phytochemicals

The quantitative results of phytochemical compounds in SOPE, SHPE and LMPE are presented in Table 2. There were significant differences ($p<0.05$) in all the phytochemical compounds measured in sweet orange, shaddock and lemon peel extracts. Sweet orange peel extract contains significantly higher steroids (34.43 mg/100g DW), flavonoids (161.82 mg/100g DW), terpenoids (17.09 mg/100g DW), glycosides (2.00 mg/100g DW), triterpenes (0.13 mg/100g DW) and alkaloids (32.44 mg/100g DW) than SHPE and LMPE. Shaddock peel extract (SHPE) had more saponin content (0.42 mg/100g DW) and phenolics (26.76 mg/100g DW) than SOPE and LMPE. Whereas, lemon peel extract (LMPE) had more tannins contents (1.74 mg/100g DW) and coumarins (0.05 mg/100g DW) than SOPE and SHPE (Table 2). The total phenolic compounds in saponins and phenolics that was found to be higher in shaddock peel extracts (SHPE) (0.42 and 26.76 mg/100 g DW) as compared to sweet orange peel extracts (SOPE) (0.19 and 2.68 mg/100 g DW) and LMPE (0.00 and 1.79 mg/100 g DW), could be owing to the abundant betacyanin pigments found in shaddock plants, which have been linked to the formation of phenolic compounds in plant tissue by raising the phenolic content (Shahidi *et al*., 2019). This study was consistent with the findings of Nurliyana *et al*. (2010), who discovered that dragon fruit peel contains more phenolic chemicals than grape and mango fruit peel. Tannins are a type of phenolic substance that can be divided into two categories: hydrolysable and condensed tannins. The increased tannin content of lemon peel extract LMPE (1.74 mg/100 g DW) compared to SHPE (1.63 mg/100 g DW) and SOPE could be attributed to the long ripening process in lemon fruit, which can slow the rate at which tannin is hydrolysed. Overall, the findings are consistent with those of (Hafiz *et al*.,2020), who discovered that avocado peel had a greater total tannin concentration (9.01 0.20 mg CE/g) than mango, sweet orange, and lemon peel.

The low value of SOPE (0.00 mg/100 g DW) may be related to the hydrolysable kind of tannin it contains, which frequently drops during the ripening process (Masibo and He, 2008). The highest amount of flavonoid was found in the SOPE (161.82 mg/100 mg DW), followed by LMPE (160 mg/100 mg DW) and SHPE (148.13 mg/100 mg DW), corroborate with those of Marina and Noriham (2014), who found that mango peel contains more flavonoids than other tropical fruit peels including guava and pineapple peels. Flavonoids are found in higher concentrations

in tropical fruits that ripen quickly. However, the flavonoid content variation observed in this study varies from that reported by Ayala – Zavala *et al*. (2011), who discovered increased flavonoid content in lemon and other tropical fruits. This could be due to changes in growing regions, environmental circumstances, variety differences, and extraction methods. Fruits grown in different climates have variable flavonoid content in their peels, with the peels being the exterior part of the fruit body exposed to more sunlight than the pulp, resulting in the synthesis of flavonoids that are plentiful and diversified. The flavonoid profile of the same fruits cultivated in different regions under varied climatic circumstances, soil qualities, and cultivation practices has a variable flavonoid profile (Loh *et al*., 2017). Furthermore, the extraction efficiency of flavonoids varies depending on extraction parameters such as solvent type, solvent concentration, extraction duration and temperature, and solvent-to-solid ratio (Ruiz-Montanez *et al*., 2014). Glycosides, triterpenes and alkaloids that were higher in SOPE (2.00, 0.13 and 32.44 mg/100 mg DW) compared with LMPE (0.88, 0.12 and 6.55 mg/100 mg DW) and SHPE (0.00, 0.11 and 4.03 mg/ 100 mg DW), suggest that secondary metabolites such as glycosides, triterpenes, and alkaloids were simpler to extract from sweet orange peel than lemon or shaddock peel using the methanol extraction method. The findings of this study correspond with those of Amin *et al*. (2017), who found that utilising the methanol extraction method, the contents of metabolites such as alkaloids were simpler to extract in orange peel than in lemon peel.

Table 2. Quantitative Phytochemical Screening of SOPE, SHPE, and LMPE

Compounds	SOPE	Treatments			
		SHPE	LMPE	SEM	P value
Saponin (mg/100g DW)	0.19^{b}	0.42^{a}	0.00^{c}	0.01	<0.0001
Tannins (mg/100g DW)	0.00^{c}	1.63^{b}	1.74^{a}	0.02	<0.0001
Phenolics (mg/100g DW)	2.68^{b}	26.76^{a}	1.79^{c}	4.23	<0.0001
Steroids (mg/100g DW)	34.43^{a}	25.60^{c}	32.85^{b}	3.20	<0.0001
Flavonoids (mg/100g DW)	161.82^{a}	148.13^{c}	160.34^{b}	0.01	<0.0001
Coumarins (mg/100g DW)	0.03 ^{b}	0.01^{c}	0.05^{a}	0.01	<0.0001
Terpenoids (mg/100g DW)	17.09^{a}	14.13^{b}	0.00^{c}	2.10	<0.0001

Triterpenes (mg/100g DW)	0.13^{a}	0.11^{c}	0.12^{b}	0.01	<0.0001
Alkaloids (mg/100g DW)	32.44^{a}	4.03^{c}	6.55^{b}	6.54	<0.0001

$^{a, b, c}$ means having different superscripts along the same row are significantly different ($p < 0.05$)

The results of the interactive effect among sweet orange, shaddock and lemon peel extracts and the concentration on the per cent inhibition are presented in Table 3. there were interactions ($p<0.05$) among the sweet orange, shaddock and lemon peel extracts and their concentrations measured at different per cent inhibition levels. At inhibition level measured at 20, 40 and 60 %, the concentration in mg/ml of shaddock peel extracts was significantly higher ($p<0.05$) than those of sweet orange and lemon peel extracts. However, at inhibition level measured at 80 and 100 per cent, the concentration in mg/ml of sweet orange peel extracts was significantly higher ($p<0.05$) than those of shaddock and lemon peel extracts. But at 100 per cent, the concentration of shaddock and lemon peel extracts were similar. Regardless of the extracts, the concentrations in mg/ml DPPH measured at inhibition level of 100 % was significantly higher ($p<0.05$) compared to concentrations of extracts measured at inhibition levels of 20, 40, 60 and 80 %.

Table 3. 1, G1 – diphenyl 2- picrylhydrazyl (DPPH) and Radical Scavenging Activities of SOPE, SHPE, and LMPE

Extracts	% DPPH Inhibition
SOPE	66.70^{c}
SHPE	83.68^{a}
LMPE	80.48^{b}
SEM	0.02
P- Value	<0.0001
% DPPH Inhibition	Concentration (mg/ml)
20	73.71^{d}
40	57.50^{e}
60	81.07^{c}
80	83.75^{b}
100	88.77^{a}
SEM	0.03
p-Value	<0.0001

$^{a, b, c}$ means having different superscripts along the same row are significantly different ($p < 0.05$)

The result in Table 3 indicated that sweet orange peel extracts had the lowest concentration of 12.76 mg/ml measured at DPPH inhibition level of 40 per cent. When compared to other extracts, the SOPE had a higher DPPH per cent inhibition concentration of 89.27 mg/ml at 100 % inhibition level. This contradicts the findings of Ajila *et al*. (2007), who found that grapefruit peels had a better ability to scavenge DPPH radicals than sweet orange and mango peels (9.17 ± 0.19, 8.67 ± 0.49 and 8.67 ± 0.44 mg AAE/g, respectively). This could be due to the freeze-drying procedure used on the fruit peels. Free radicals are scavenged and neutralized by the freeze-drying process, which produces redox-active metabolites (Castro- Vazquez *et al*., 2016). In other words, SOPE will be more effective at chelating the hydroxyl free radicals in glutathione peroxidase, preventing aging in people and animals and reducing oxidative damage in meat products. This study adds to Sara *et al*. (2008) findings, which indicated that there was a link between glutathione peroxidase, antioxidant enzymes, disease, and aging in humans.

Conclusion

the data and empirical evidence obtained from this study showed that peel extracts of sweet orange, shaddock and lemon fruits contains useful natural antioxidants that can serve as alternative preservative agents and antioxidants to butylated hydroxyanisole (BHA), a synthetic antioxidant.

Abstract

The study was conducted to evaluate the effects of herbal feed additives on the in vitro and ruminal fermentation by West African dwarf goats. A total of 20 goats were subjected to five dietary treatments for a 12- week feeding study in a completely randomized design: Feed only (control) (T1), Feed + *Ocimun gratissimum* leaf meal (T2), Feed + *Phyllantus amarus* leaf meal (T3), Feed + *Lactuca taraxacifolia* leaf meal (T4), Feed + P. amarus + O. gratissimum + L. taraxacifolia leaf meal (T5). Phytochemical Screening of the three herbs were carried out. Herbs were added at 3g/kg feed and were given at 5% body weight of the animal. The feed samples were subjected to 24 hours incubation. Gas volume were measured at the interval of 3hrs. At the end of incubation, methane volume was estimated. The gas volume produced was used to calculate metabolizable energy (ME), organic matter digestibility (OMD) and short chain fatty acid (SCFA) concentrations. At the end of the feeding trial, rumen liquor was collected to determine ruminal characteristics and the microbial population as may be affected by the medical plants. The results showed that the leaves of the herbs were rich in saponin, tannin and alkaloid. The three medicinal plants were relatively high in crude protein (CP) and moderate in carbohydrate (CHO) content. Treatment containing the mixture of *O. gratissimum, P. amarus and L. taxifolia* (T5) contained more CP than the rest of the treatments while T2 had the highest CF. There was apparent increase in the value of potential gas production as the incubation period increases in *in-vitro* study. T1 and T4 produced more gas than the rest of the treatments. Methane production was lower in T3 and T5 compared to other treatments. T1 and T4 equally had the highest ME, OMD and SCFA concentrations. However, T3 and T5 improved the ruminal characteristics and microbial population in the rumen as the population was significantly modified. It is therefore concluded that T3 (*Phallantus amarus*) and the combination of the three herbs (T5) be used as feed additives for mitigating methane emission and improve rumen ecology of the animals for enhanced ruminant productivity.

Introduction

Adopting feeding strategies to mitigate the amount of energy lost as methane and reduce ammonia concentration in the rumen can enhance feed conversion efficiency, improve animal productivity and reduce global warming (Gebrehiwot, 2014). Researchers have shown that manipulation of rumen microbial fermentation to decrease methane and ammonia production from ruminant livestock using extracts/meal of herbs and spices has proven to be a potentially useful strategy in improving production efficiency in ruminants (Benchaar *et al.*, 2008; Benchaar and Greathead, 2011). Methane expelled by ruminants is one of the most important sources of global warming, having a great impact on the environment. Greenhouse gas emission, especially methane from ruminants, has been recognized as an important issue worldwide as it is a driver for global warming and climate change (Kim *et al*., 2012). It has been reported that livestock production and its by-products are responsible for at least 51 percent of global warming gases (Goodland and Anhang, 2009). Gas emissions from the livestock sector are estimated at between 4.1 and 7.1 billion tonnes of carbon dioxide equivalents per year, equating to 15-24% of total global anthropogenic greenhouse gas emissions (Wanapat *et al.*, 2013).

Phytogenics, are natural bioactive compounds that are derived from plants and incorporated into animal feed to enhance productivity (Gadde *et al* 2017) and reduction in methane emission to the environment. The incorporation of synthetic antibiotics in the ration of livestock has raised public concerns because of the development of drug-resistant bacteria. However, the use of some herbs and spices has proved to influence the rumen environment (Szumacher-Strabel and Cieślak, 2010; Cieslak *et al.*, 2013). Rezaei and Pour (2012) reported that the addition of thyme methanolic extracts had a reducing effect on the degradability of soybean meal using an in vitro gas production technique. Chaudhry and Khan (2012) in an in vitro rumen fermentation study with five curry spices which include coriander, turmeric, cumin, clove and cinnamon revealed that the spices acted as natural antibiotics, destroying methane-producing bacteria in the animal's gut which led to a reduction in methane production.

Dong *et al.* (2010) reported a reduction in methane production, increased propionate production and decreased protozoa numbers when luzerne extract, *Artemisiae annuae* extract and mixed herbal medicine were included in goat diets. In another study conducted to assess the effect of ginger (*Zingiber officinale*) on the in vitro rumen ecosystem of sheep, Mohammad and Moeini (2015) reported that ginger supplementation improved ruminal fermentation due to a reduction in ammonia, reduction in methane loss, reduction in acetate to propionate ratio and beneficial changes in protozoa population. In addition, Tag El-Din *et al.* (2012) also concluded that the addition of garlic juice and ginger improved rumen fermentation, increased gas production and reduced methane production. Busquet *et al.* (2005) also reported that garlic oil altered rumen fermentation by reducing the acetate to propionate ratio like what is obtainable using monensin in a continuous culture. Kim *et al.* (2012) also reported that plant extracts were shown to have properties to reduce methane production, reduce acetate to propionate ratio, decrease methanogen population and increase fibrolytic bacteria population.

Meanwhile, Mariam *et al.* (2014) investigated the potential impacts of different levels of essential oils blend (eucalyptus, cinnamon, peppermint, thyme and lemon) on rumen fermentation parameters and nutrient utilization in barki sheep and reported no significant effects on *in vitro* gas production, methane production, short chain fatty acids (SCFA), NH_3-N concentration and protozoa count. Notwithstanding, Arhab *et al.* (2013) observed a significant reduction in methane production, rumen fermentation traits and decreased ammonia N concentration when essential oils extracted from *Juniperus phoenicea*, *Satureja calamintha* and *Mentha pulegium* were used in vetch oat hay *in vitro*. To mitigate climate change, there is a need to reduce greenhouse gas (GHG) emissions from all the sectors. Reisinger *et al*. (2021) observed that reduction in global warming to below 2º C cannot be realistic without reducing emissions from the agricultural sector

Studies reported that dietary supplementation with 10 g/DM of plantain herb and/or 10 g/DM of *Allium sativum* (garlic leaf) resulted in enhanced crude protein intake, dry matter intake, feed conversion ratio and body weight gain compared with the control diet (Redoy *et al*., 2020).

Similarly, dietary *Andrographis paniculata* leaves and stems increase feed intake and growth performance in goats (Yusuf, 2015). It has also been reported that the dietary supplement with *Nigella sativa* seeds or *Rosmarinus officinalis* leaves at 1 % concentration enhanced nutrient digestibility in lambs (Odhaib *et al.*, 2018). Moreover, the addition of *N. sativa* leaf meal up to 66.7 % as a replacement for cottonseed meal in the diets of sheep resulted in improved feed utilization and growth performance of growing Farafra sheep (Abdullah and Farghaly, 2019).

Materials and Methods

Experimental Site

The experiment was conducted at the Small Ruminant Unit at Teaching and Research Farm, Kwara State University, Malete, Kwara State. The location is situated on Latitude 8.71^0N and Longitude 4.44^0E (Ogunbosoye *et al.*, 2015) in the southern Guinea Savannah agro-ecological zone of Nigeria.

Experimental Animals

The experimental animals comprised twenty (20) growing WAD goats, sourced within the Ilorin metropolis. They were neck tagged for identification and quarantined upon arrival at the Small Ruminant Unit of the Teaching and Research Farm. The animals were vaccinated against Pestes des Petit Ruminants (PPR) using the PPR vaccine at the rate of 1mL per animal to confer immunity, administered with Albendazole (dewormer at 12.5 mg/kg body weight), dusted with ectoraid against ectoparasites and treated with oxytetracycline HCl (a broad spectrum antibiotic) before the commencement of the experiment. The animals were housed in their pen with *ad libitum* access to clean water.

Procurement and Preparation of Herbs

Phyllantus amarus, *Ocimum gratissimum* and *Lactuca taraxacifolia* were harvested within the school farm in large quantities. They were air dried for 3 -5 days (by laying them over metal mesh rack dryers placed above the floor) at room temperature, then milled into fine powder, sieved through a 1mm gauge and preserved in tightly closed plastic jars until use.

Experimental Design and Diet Formulation

The animals were randomly allotted to five treatments in a completely randomized design (CRD) with four (4) goats in each of the treatments. The five experimental treatments were:

Treatment 1: Feed only (control).
Treatment 2: Feed + *Ocimun gratissimum*
Treatment 3: Feed *Phyllantus amarus*
Treatment 4: Feed + *Lactuca taraxacifolia*
Treatment 5: Feed + *Phyllantus amarus* + *Ocimun gratissimum* + *Lactuca taraxacifolia*

Herbs Administration

The herbs were administered to the goats at 3g/ kg feed as described by Abdelhamid *et al.* (2011). The procedures were repeated every week. The weighted content was served at 8.00 hr. and 16.00 hr. daily throughout the experimental period.

Chemical Composition

The moisture content of the diets was determined by drying in a forced-air oven at 60^0C until constant weight was achieved. After drying, samples were ground to pass a 2 mm sieve and then subjected to proximate analysis according to AOAC, (2005). The carbohydrate content was calculated from the differences in the sum of protein, fat, moisture, and ash content subtracted from 100. Neutral detergent soluble (NDS), Neutral detergent fibre (NDF), Acid detergent fibre (ADF), Acid detergent lignin, Hemicelluloses and cellulose were analyzed according to Van Soest *et al.* (1994) procedure.

In vitro Fermentation

Rumen fluid was obtained from five West African dwarf (WAD) goats through the suction tube before the morning feed and sieved with four layered cheesecloth in continuous flushing with CO_2. To 200 mg sample in the syringe was added 30 ml inoculum that contained rumen liquor and buffer (9.8g $NaHCO_3$ + 2.77g Na_2HPO_4 + 0.57g KCl + 0.47g NaCl + 0.12g $MgSO_4$. $7H_20$ + 0.16g $CaCI_2$. $2H_2O$ in a ratio 1:4 v/v respectively. Incubation was carried out in 120 ml calibrated syringes in five replicates with blank syringes (no substrates) at 39 ± 1º C for 24 hrs. The gas production was measured at 3, 6, 9, 12, 15, 18, 21 and 24h (Menke and Steingass, 1988). The average volume of gas produced from the blanks was deducted from the volume of gas produced per sample.
Metabolizable energy (ME, MJ/Kg DM), organic matter digestibility (OMD %) and short-chain fatty acids (SCFA µmol) were estimated at 24h incubation
ME = 2.20 + 0.136 GV + 0.057 CP + 0.0029CF (Menke and Steingas, 1988).
OMD = 14.88 + 0.88GV + 0.45CP +0.651XA (Menke and Steingas, 1988).
SCFA = 0.0239GV – 0.0601 (Getachew *et al.*, 1999).
Where GV, CP, CF and XA are net gas production (ml/200mg, DM) at 24 h incubation time, crude protein, crude fibre and ash contents of incubated samples respectively.

Methane Production

At the end of 24 hours of incubation, 4 ml of NaOH (10 M) was introduced, following a procedure of Fievez *et al.* (2005). The content was inserted into the silicon tube, which was fastened to the syringe. The clip was then opened while the NaOH was gradually released. The content was agitated while the plunger began to shift position to occupy the vacuum created by the absorption of CO_2. The volume of methane was read on the calibration.

Determination of Rumen Liquor Parameters

pH and NH_3-N Analysis

At the end of the growth study, the goats fasted overnight but water was served *ad libitum*.100ml rumen fluids were collected from the West African Dwarf (WAD) goats according to the treatments using a stomach tube, sieved with a four-layered muslin cloth into a beaker. The pH of the rumen fluid was measured immediately using a pH meter. The collected rumen liquor samples were then strained, frozen and later thawed at room temperature and then shaken. The contents were transferred into glass tubes and centrifuged at 4000 rpm for 10 minutes. The supernatant was analyzed for ruminal ammonia-nitrogen concentration (NH_3-N) by the method of steam distillation with MgO using a Kjeltec distillate unit as described by AOAC (2012). The NH_3-N concentrations were calculated according to the following equation:
NH_3-N (mg/100ml) = [ml. of HCl titrate ×normality of HCl × 0.014 / volume of rumen liquor (1ml)] ×100 (AOAC, 2012)

Total Volatile Fatty Acids Analysis

Total volatile fatty acids (TVFAs) in the rumen liquor were estimated according to the steam distillation method (Samuel *et al.*, 1997). The TVFAs were calculated according to the following equation:
TVFA (mmol/L) = (ml. NaOH titrate ×normality of NaOH/volume of rumen liquor (1ml) ×1000) (Samuel *et al.*, 1997). The molar proportions of individual volatile fatty acids (VFA) were determined by chromatography technique using high-performance liquid chromatography according to the method described by (Filípek and Dvořák, 2009). The rumen fluids were sent to the laboratory to measure the individual volatile fatty acids; acetic acid, propionic acid and butyric acid.

Microbial Count Analysis

Rumen fluid was also used for total direct counts of bacterial, protozoa and fungal zoospores using methods of Galyean (1989) by haemacytometer. One (1) ml of rumen fluid was transferred to a plastic bottle to which 9 ml of 10 ml/L formalin solution (1:9 v/v, rumen fluid: 10 ml/L formalin) was added and then stored at 4°C for measurement of fungal zoospores and the protozoa population. Another 10 ml of the fluid was used for viable

bacteria count (total viable bacteria count) according to the method of Aberu *et al.* (2004). Total viable counts of bacteria were determined in roll tubes on a complete medium, while numbers of cellulolytic bacteria were estimated as the most probable number using a cellulose medium.

Data Analysis

Data collected for all determined parameters were subjected to Analysis of Variance (ANOVA) and differences between treatment means were separated by Least Significance Difference using the General Linear Model procedure of Statistical Analysis System (SAS, 2011).

Results and Discussion

Phytochemical Qualitative Abundance of Leaves of Lactuca taraxacifolia, Phyllanthus amarus and Ocimum gratissimum

Table 1 shows the phytochemical qualitative abundance of leaves of *Lactuca taraxacifolia, Phyllanthus amarus* and *Ocimum gratissimum*. The results showed that there was abundant (high) presence of saponin (+++) in *Lactuca taraxacifolia* and *Ocimum gratissimum*, but was moderately (++) present in *Phyllanthus amarus*. Steroid (+) was relatively present in *Lactuca taraxacifolia* and *Phyllanthus amarus* but was absent (-) in *Ocimum gratissimum.* Tannin (+) was relatively present in *Latuca tarataxifolia* and *Phyllanthus amarus* but was moderately present (++) in *Ocimum gratissimum.* Terpenoid was relatively present in *Lactuca taraxacifolia* but was absent in both *Phyllanthus amarus* and *Ocimum gratissimum.* Flavonoids presence was moderate (++) in *L. taraxacifolia*, relative in *Ocimum gratissimum* and absent in *P.* amarus. Glycoside was only present in *L. taraxacifolia*. Phenol was present (+) in *L. taraxacifolia* and *O. gratissimum*, but absent (-) in *P.* amarus. Oxalate was absent (-) in all the medicinal plants while phytate was only relatively present in *O. gratissimum*

Phytochemicals are biologically active compounds (naturally occurring chemicals in plants), found in trace amounts, which are not established nutrients, but contribute significantly to protection against degenerative diseases and have disease-preventive properties (Ladipo *et al.*, 2010). The presence of tannins, saponins, steroids, flavonoids, cardiac glycosides and terpenoids has also been reported in *L. taraxacifolia* (Adinortey *et al.* (2012). Likewise, Rosine *et al.* (2022) reported the presence of phenols, flavonoids, tannins, anthraquinones, alkaloids, steroids and glycosides and absence of terpenoids and saponins in *Lactuca taraxacifolia.* The high presence of favonoid, glysosides and terpenoids, moderate presence of phenols, tannin and phatates, slight presence of alkanoid, saponin and steroid and the absence of oxalate was reported by Mgbeje *et al.* (2019) in *Ocimum gratissimum*. *Phyllanthus amarus* has been reported to contain tannins, saponins, flavonoids, terpenoids, alkaloids, steroids and glycosides in relative amounts (Alexandra, 2016).

Table 1. Phytochemical Screening of leaves of *Lactuca taraxacifolia* (LT), *Phyllanthus amarus* (PA) and *Ocimum gratissimum* (OG)

Phytoconstituents	LT	PA	OG

Key: present (+), moderately present (++), highly present (+++), not present (-)

Proximate Composition of Lactuca taraxacifolia, Phyllanthus amarus and Ocimum gratissimum

The proximate composition of *Lactuca taraxacifolia, Phyllanthus amarus* and *Ocimum gratissimum* is presented in Table 2. The crude protein (CP) contents of the herbs ranged between 15.87 and 19.44%, the ash content was lowest in ocimum (2.55%) but highest in latuca (20.34%), and crude fibre was also highest for latuca (14.39%). The quantity of CP of above 15 % recorded in the leaves suggests that the leaves have an appreciable amount of protein that may be made available to the rumen microbes which could lead to an increase in the digestibility of the feed, thereby enhances productivity of the ruminant. The crude protein contents obtained in all the leaves study are above the 10-12% recommendation for the growth or maintenance of small ruminants and are also above the minimum threshold level (7% CP) required for optimal rumen microbial activities (Norton, 2003). Carbohydrate contents of *Ocimum gratissimum* obtained in this study is comparable to the value of 66.34 obtained for *Ocimum gratissimum* by Gideon *et al.* (2018) but was higher than the one reported by Akinwumi and Omotayo (2016) of

common vegetables in southwestern Nigeria. Likewise, carbohydrate contents of *Phyllanthus amarus* obtained in this study is higher than the value of 30.56 obtained for *Phyllanthus amarus* by Adinortey *et al.* (2012). This makes *O. gratissimum* and *P. amarus* a good source of energy for animal. Ash contents in *Lactuca taraxacifolia,* being high is an indication of its richness in minerals.

Table 2. Proximate Composition (%) of *Lactuca taraxacifolia, Phyllanthus amarus* and *Ocimum gratissimum*

Parameters	LT	PA	OG
Dry Matter	7.44	10.43	7.96
Crude Protein	19.44	15.87	15.98
Total Ash	20.34	5.73	2.55
Crude Fibre	14.27	7.83	9.85
Crude Fat	0.49	7.02	2.45
Carbohydrate	37.90	53.12	61.21

All the parameters measured for chemical composition of the experimental diets fed to WAD goats were significantly influenced (P<0.05) by dietary treatments (Table 3). The values ranged as follows; crude protein (13.47 – 17.27%), crude fibre (4.89 – 5.94%), ash (4.90 – 6.69%), ether extract (6.79 – 8.51%), carbohydrate (42.76 – 63.51%), Neutral Detergent Soluble NDS (9.57 – 11.41), Acid Detergent Fibre (37.83 – 39.98), Acid Detergent Lignin (29.01 – 30.90), hemicellulose (7.93 – 10.15), cellulose (22.86 – 31.11) and Neutral Detergent Fibre (61.94 – 69.88).

A high dry matter content diets makes the diets a good source of feed for animals in the dry season and will also encourage more feed intake. Moreover, diet containing the mixture of *Ocimum gratissimum*, *phyllantus amarus* and *Lactuca taraxacifolia* (T5) had the highest crude protein (17.27) than the rest of the diets. This suggest that the combination of the 3 herbs in the diet of the goats improved the nutritive capacity of the diets. Similar findings were reported by Amany *et al.* (2022) who also observed that the mixture of herbal plants improved the crude fibre and nutritive value of experimental diets. Diet with *Ocimum gratissimum* (T2) only also had appreciable nutritive value as the CP though slightly lower in value but was statistically similar to that of T5. This suggests that *Ocimum gratissimum* might be considered a veritable protein rich vegetable with potential to serve as substitutes for protein in diet of ruminants especially goats. This is consistent with the findings of Gideon *et al.* (2018) who describes *Ocimum gratissimum* as being very rich in proteins and can serve as substitutes for protein, especially among rural dwellers.

However, T2 had the highest crude fibre content with the least value recorded in T1. This suggests that the herbs especially *Ocimum gratissimum* contain appreciable level of fibre in their composition. There were more of carbohydrate in diets containing herbs compared to control diet with diet T3 having the highest CHO. This indicates that the addition of the herbs to the diets increases the energy content of the diets and thus could use as energy source in goats diet formulation. Fajohunbo and Egbeyale (2010) had earlier reported that carbohydrate is the dominant nutrient in *O. gratissimum* when compared to its crude fibre, ash and crude protein values. Ezeonu *et al.*, (2012) also reported that there is likelihood of prebiotics being contained in *O. gratissimum* as a green leafy vegetable and since prebiotics are carbohydrate complexes, it suggests that the plant could contain a good quantity of some classes of prebiotics. Cellulose and hemicellulose of diet with herbs were higher than the control diet, except in T5 which was similar statistically to control diet. This is expected as the herbs are plant-based feed materials which are expected to be made up of certain levels of cellulose and hemicellulose contents.

Table 3. Chemical Composition (%) of Experimental Diets with the Inclusion of Herbs

Parameters	T1	T2	T3	T4	T5	SEM
Dry matter	92.85^{a}	93.11^{c}	92.99^{b}	93.11^{c}	93.00^{b}	0.0006
Crude Protein	15.75^{ab}	16.08^{ab}	13.47^{c}	15.20^{b}	17.27^{a}	0.6884
Crude Fibre	4.89^{d}	5.94^{a}	5.51^{c}	5.64^{b}	5.67^{b}	0.0008

Ether Extract	8.51^{a}	7.91^{b}	6.79^{d}	7.06^{c}	7.14^{c}	0.0436
CHO	42.76^{e}	57.15^{c}	63.51^{a}	58.53^{b}	56.41^{d}	0.0780
Neutral Detergent Soluble	11.41^{a}	10.53^{b}	10.82^{b}	9.57^{c}	10.36^{b}	0.0698
Acid Detergent Fibre	39.08^{b}	39.98^{a}	39.94^{a}	38.67^{c}	37.83^{d}	0.0329
Acid Detergent Lignin	30.18^{b}	30.90^{a}	29.43^{c}	29.01^{d}	29.90^{b}	0.0822
Hemicellulose	8.90^{c}	9.09^{b}	10.15^{a}	9.83^{a}	7.93^{c}	0.0822
Cellulose	22.86^{d}	28.31^{c}	29.97^{b}	31.05^{a}	31.11^{a}	0.0102
Neutral Detergent Fibre	61.94^{e}	68.29^{c}	67.93^{d}	69.88^{a}	68.94^{b}	0.0123

^{abcde} Means along the same row with different superscripts are significantly different (P<0.05), SEM = Standard Error of Mean, CHO = carbohydrate, T1 = No herbs (Control), T2 = *Occimum gratissimum*, T3 = *Phyllantus amarus*, T4 = *Lactuca taraxacifolia*, T5 = *P. amarus* + *O. gratissimum* + *L. taraxacifolia*

In vitr Gas Production Pattern of the Experimental Diet

There was non-significant (P>0.05) variation in the gas production pattern of the experimental diets (Table 4). The volume produced under each treatment continue to increase at every three hours. The values for 3 hours incubation period ranged from 8.00 – 9.33 ml/200mg DM and continues to increase till 24th hour from 26.33-36.33 ml/200mg DM among the diets. This trend is an indication that more degradation is still possible after 24 hours of incubation due to rises in the gas at every three hours. Though the production of gas was not significantly (P>0.05) influenced by the incubation period, T1 and T4 diets produced more gas followed by T2 and then T3 while T5 had the least gas production. The production of more gas may be due to higher percentage of cellulose and hemicellulose in T4 diet and higher crude fibre content in *Lactuca taraxacifolia*, than others. Likewise the less gas production as observed in T5 may be due to lesser carbohydrate in the diet when compared with others. Gas production is a function of and a mirror of degradable carbohydrate and therefore, the amount depends on the nature of the carbohydrates (Blummel and Becker, 1997). Many factors may determine the amount of gas produced during fermentation, factor such as the nature and level of fibre, the presence of secondary metabolites and potency of the rumen liquor for incubation (Babayemi *et al.*, 2004). The trend of gas production in this study is consistent with the trend reported by Bunglavan *et al.* (2010) where supplementation of eight different herbs in ruminant diets also led to the continuous production of gas at every four hours incubation.

Table 4. *In vitro* Gas Production Volume of the Experimental Diets at Different Incubation Hours

Incubation hours	Treatments						
	T1	T2	T3	T4	T5	SEM	p-value
3	8.00	9.33	7.33	9.33	7.33	1.30	0.6678

24	36.33	31.33	29.67	34.00	26.33	1.27	0.0022

[abcde] Means along the same row with different superscripts are significantly different (p<0.05), SEM = Standard error mean, T1 = No herbs (Control), T2 = *Occimum gratissimum*, T3 = *Phyllantus amarus*, T4 = *Lactuca taraxacifolia*, T5 = *P. amarus* + *O. gratissimum* + *L. taraxacifolia*

Methane Production of the Experimental Diets

Presented in Figure 1 is the methane production of the experimental diets. There was significant (P>0.05) variation in the methane production. Methane (CH_4) production was highest in control diet T1 than other diets with T5 recording the lowest value. It varies from 7.67 ml/200 mg DM (T5) to 12.67 ml/200 mg DM (T1). The amount of methane produced depends on the level of fermentation. It was observed from this study that experimental diet with high gas production produces more methane. Similar findings have also been reported by and Babayemi and Bamikole (2009) and Ogunbosoye (2016). Methane production is a monumental waste but it is a parameter to measure feedstuff digestibility in the rumen of an animal (Njidda and Nasiru, 2010).

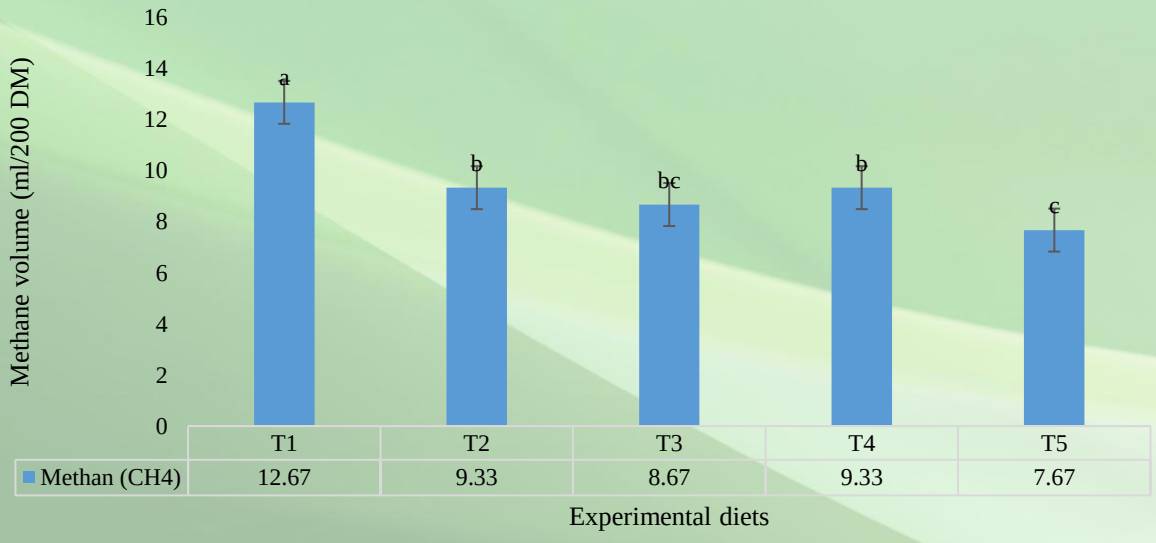

Fig 1. The methane (CH_4) production of experimental diets

Calculated OMD (%), ME (MJ/Kg) and SCFA (µmol) of Experimental Diets

Figures 2, 3 and 4 show the Organic Matter Digestibility (OMD), Metabolizable Energy (ME), and Short Chain Fatty Acids (SCFA) of the experimental diets, resoectively. All the parameters calculated in this study were significantly influenced by the experimental diets. The values for the OMD, ME and SCFA ranged from 48.56 (T5) to 57.45 (T1), 6.99 (T5) to 8.35 (T1) and 0.57 in T5 to 0.81 in T1, respectively. The range value of OMD recorded in this study indicates good digestibility of herbs despite the fact that the control diet recorded the highest digestibility potential. The values of metabolic energy yield reported in this study suggests the potential of the herbs especially *Lactuca taraxacifolia* as energy laden feed additives which can be incorporated in feed formulation for ruminant animals, as animal performance also depends on ME content present in the feed (Niemeläinen *et al.*, 2001). The levels of OMD and ME obtained in this study were similar to 40.12 to 67.06 % (OMD) and 5.58 to 10.32 MJ/Kg (ME) reported by Tag-El-Din *et al.* (2012) in ram.

The low SCFA estimated for T5 might be due to the lower gas production obtained from the diet. The appreciable estimated SCFA in T4 compared to T2, T3 and T5, further suggests the potential of *Lactuca taraxacifolia* to make energy available to the ruminants when consumed. Akinfemi and Ladipo (2014) had earlier reported that SCFA is an indicator of energy availability to the animal. The values of SCFA obtained in this study were slightly higher than the range of 0.23 to 0.60 µmol obtained by Ogunbosoye (2016) on forages fed to ruminant, but was similar to the level of 0.8 – 0.9 µmol reported by Mpanza *et al.* (2020) in ruminant. However, the values were lower than the range values of 6.07 – 6.97 µmol reported by Abd El Tawab *et al.* (2021) in ruminant fed two herbal plants based diets.

Ruminal Characteristics of West African Dwarf Goats Fed Herbal-Fortified Diets

The effect of different herbal supplementations on the ruminal characteristics of West African dwarf goats is presented in Table 5. All the parameters investigated were significantly ($P<0.05$) influenced by dietary treatments except rumen pH, acetic-propionic ratio (A/P) and rumen ammonia nitrogen (NH_3). The acetic acid values of the goats varied significantly across the treatment groups with goats fed *Phyllantus amarus* (T3) having the highest rumen acetic acid value of 36.45mm/100mL, which is statistically similar to 33.41mm/100mL recorded in goats fed T5, while the values of 28.72, 27.65 and 27.00 mm/100mL obtained in goats fed T2, T1 and T4, respectively were lower and statistically the same. A similar trend was observed in propionic acid content of the rumen. The butyric acid values were higher in all the goats fed the herbal supplements than the control group with goats fed T4 (8.39 mm/100mL) having the highest value, followed by goats on T3 (7.85 mm/100mL), T5 (7.56 mm/100mL) and T2 (7.29 mm/100mL), respectively while control group (5.98 mm/100mL) recorded the least value.

The concentration of acetic acid produced was higher than the concentration of butyric and propionic acid. This is attributed to the fact that cellulolytic bacteria produce acetic acid as major end product from fiber degradation, thus their concentration is always higher than other acids. The range values of acetic acid (27.00 - 36.45 mm/100mL) is lower to the value of 58.5 - 60.2 obtained by Seong *et al.* (2022) but higher than the values of 11.29 – 14.78 obtained by Kurniawati *et al.* (2018) in ruminant fed herbal supplements. The range values of butyric acid (5.98 - 8.39 mm/100mL) and propionic acid (6.52 - 10.42 mm/100mL) obtained in this study are consistent with the values of 5.33 - 5.96 and 9.50 - 11.62 obtained for butyric and propionic acid, respectively by Hassan *et al.* (2021)

Goats on control diet (64.59 mm/100mL), T4 (64.45 mm/100mL) and T2 (64.32 mm/100mL) diet had similar total volatile fatty acid (TVFA) values which were higher than those on T5 (61.00 mm/100mL) and T3 (58.43 mm/100mL) respectively. The range value of 58.43 – 64.45 mm/100mL obtained in this study were lower than the value of 73.14 - 90.57 mm/100mL recorded in goat fed herbal supplement by Wang *et al.* (2023). Rumen pH and TVFA content are essential index for assessing ruminal fermentation (Cui *et al.* 2022). According to Puniya *et al.* (2015), pH range of 5.5 to 6.9 is considered physiologically the normal pH that support normal feed fermentation in the rumen. In this study, supplementation of diet with herbs didn't have significant influence of the ruminal pH, besides the values were slightly lesser than the normal range values, however, TVFA changes significantly, though the values in diets supplemented with herbs were not better than the control diets. This indicates that the herbs supplementation did not improve the energy generation in the rumen of the goats as the herbs might not have aided properly the activities of ruminal cellulolytic bacterial which would have led to increased digestibility of the experimental diets for subsequent energy generation. This may be attributed to the quality of herbs in terms of their constituents and the stage at which they were harvested which might have influenced the way microbes in the rumen acted on them.

It has also been observed that the use of a lower dose of herbal supplement in ruminant diet led to the metabolic redundancy of the ruminal ecosystem, which resulted in lower concentration of TVFA in rumen (Patra *et al.*, 2019). TVFA plays an important role in maintaining and providing energy for the growth of ruminants. The structure, quality, microbial activity, and microflora of ruminant diets has been reported as factors that affect the composition and concentration of TVFA in the rumen (Sun *et al.*, 2019)

Table 5. Effect of Different Herbal Supplementation on Ruminal Characteristics of West African dwarf goats

Parameters	T1	T2	T3	T4	T5	SEM
pH	5.02	5.06	4.48	5.05	4.80	0.10
Acetic acid (mm/100mL)	27.65^{b}	28.72^{b}	36.45^{a}	27.00^{b}	33.41^{ab}	1.32
Butyric acid (mm/100mL)	5.98^{b}	7.29^{ab}	7.85^{ab}	8.39^{a}	7.56^{ab}	0.33
Propionic acid (mm/100mL)	6.69^{ab}	6.90^{ab}	10.42^{a}	6.52^{b}	8.47^{ab}	0.58
TVFA (mm/100mL)	64.59^{a}	64.32^{a}	58.43^{b}	64.45^{a}	61.00^{ab}	0.92
A/P	4.40	4.18	3.56	4.22	4.08	0.18
NH_3-N(mg/100mL)	5.30	5.06	4.48	5.05	4.80	0.10

[a,b] Means along the same row with different superscripts are significantly different (P<0.05), SEM = Standard Error of Mean, TVFA= Total Volatile Fatty Acids, A/P= Acetic acid: Propionic acid, NH_3-N= Rumen ammonia Nitrogen, T1 = No herbs (Control), T2 = *Occimum gratissimum*, T3 = *Phyllantus amarus*, T4 = *Lactuca taraxacifolia*, T5 = *P. amarus + O. gratissimum + L. taraxacifolia*

Effect of Different Herbal Supplementation on the Rumen Microbial Count of West African Dwarf goats

The effect of different herbal supplementation on the rumen microbial count of West African Dwarf goats is presented in Table 6. Herbal supplementation had significant (P<0.05) effect on the microbial population of West African Dwarf goats observed in this study. The total bacterial count, fungal count and protozoan values of the experimental goats ranged from 65.33 - 190.00 × 10^{-4}cfu/mL, 5.67 – 11.00 sfu/mL and 12.67 – 28.67 x10^{-2}/mL respectively.

It is observed that the population of bacteria (190.00) and fungi (11.00) were highest in diet containing the mixture of *P. amarus, O. gratissimum and L. taraxacifolia*. This indicates that herbal mixtures as against sole supplementation perhaps had better impact on the ruminal cellulolytic bacterial activity by multiplying their number to ensure increased digestibility. Moreover, sole supplementation with *P. amarus, O. gratissimum and L. taraxacifolia* also increases the population of bacteria and fungi in the rumen of the goats compared to the control group. The increase population of cellulolytic bacterial is considered a positive impact as the rumen bacteria are known to involve in the degradation of plant polysaccharides to produce VFA as the main source of energy for animals (Mizrahi, 2012). Thus, cellulolytic bacterial activities in the rumen is beneficial to the animal as they help ensure increased digestibility of feed material, ensure availability of nutrient for absorption by the animal. The range values of bacteria obtained in this study were higher than the values of 2.06 – 3.05 obtained in WAD goats fed *O. gratissimum* as reported by Adebayo *et al.* (2019) and higher than 3.1 – 7.6 obtained by Wanapat *et al.* (2013). It is also observed that the population of protozoa were lower in diets supplemented with herbs compared to the control diet except in diet supplemented with *Lactuca taraxacifolia* (T4).

The least protozoa population was recorded in diet supplemented with *P. amarus* (T3). This indicates that other herbs and their combination were able to inhibit the destructive nature of protozoa in the rumen. The secondary plant metabolites in herbs especially saponins have been found to suppress or eliminate protozoa from the rumen and reduce methane and ammonia production (Anantasook and Wanapat, 2012). At appropriate dose, saponins or saponins containing plants have been shown to suppress protozoal population, increase bacteria and fungi population and decrease methanogenesis hence improve performance in ruminants (Sirohi *et al.*, 2009). Lila *et al.* (2003) had earlier reported that the elimination of ciliate protozoa from the rumen reduced methane emission by 30 to 45%. The range value of protozoa population obtained in this study was higher than the value of 4.8 – 7.8 x10^{-2}/mL obtained in ruminant by Wanapat *et al.* (2013) and the higher 0.25 – 0.68 x10^{-2}/mL obtained in WAD goat by Adebayo *et al.* (2019). This also explain why the diet with highest protozoa produced the highest methane.

Table 6. Effect of Different Herbal Supplementation on Rumen Microbial Count of West African Dwarf Goats

Parameters	T1	T2	T3	T4	T5	SEM
Total bacterial count (x10^{-4}cfu/mL)	65.33^{d}	71.67^{cd}	93.33^{b}	75.00^{c}	190.00^{a}	2.83
Total fungal count (sfu/mL)	5.67^{b}	5.83^{b}	9.50^{a}	6.67^{b}	11.00^{a}	0.51
Protozoan (x10^{-2}/mL)	19.00^{b}	13.33^{c}	12.67^{c}	28.67^{a}	17.50^{b}	0.90

SEM = Standard Error of Mean, T1 = No herbs (Control), T2 = *Occimum gratissimum*, T3 = *Phyllantus amarus*, T4 = *Lactuca taraxacifolia*, T5 = *P. amarus + O. gratissimum + L. taraxacifolia*

Conclusion

The results of this study demonstrate that the leaves of *Latuca taraxacifolia*, *Phyllanthus amarus*, and *Ocimum gratissimum* are rich in bioactive compounds, including saponin, tannin, and alkaloid. These phytochemicals significantly impacted methane production, with diets supplemented with *Phyllanthus amarus* and the combination of *Latuca taraxacifolia + Phyllanthus amarus + Ocimum gratissimum* exhibiting substantial reductions in methane production. Furthermore, the studied plant combinations improved ruminal characteristics and significantly modified the microbial population in the rumen, highlighting their potential as natural feed additives for mitigating methane emissions and promoting rumen health.

Production of Pregelatized Legume Flour From Sortex Rejected Chickpea and White Kidney Bean

Nura Seyid Bekir, Sedat Sayar

Department of Food Engineering, Faculty of Engineering, University of Mersin, 33342 Mersin, Türkiye

Abstract

The undersized grains in the Sortex rejected part of the legume processing plants have similar nutritional properties with the commercial seeds. Processing these waste legumes and offering them to domestic and foreign markets has the potential to contribute to the country's economy. Therefore, this study was designed to examine the potential of producing relatively higher value-added natural food components from waste legumes with low commercial value. In this study, soaking, boiling and dehulling processes were applied in order to produce flour with different properties from Sortex rejected white kidney beans and chickpeas. Flour samples were obtained from both soaked and boiled (pregelatinized) samples of each legume. The effect of seed coat on the flour quality were also determined. Color, ash, protein, dietary fiber, water absorption capacity and trypsin inhibitor activity were analyzed in these flour samples. According to the total dietary fiber analysis, it was determined that the dietary fiber content of the seed, without seed coat removal, was higher. Pregelatinization process significantly increased the water absorption capacity of flour samples in both legume varieties. While negligible decreases were observed in trypsin inhibitory activity of soaked samples, a significant decrease was detected with pregelatinization process. In general, L* values of flours obtained from white kidney beans and chickpeas increased with soaking process and decreased after pregelatinization. In a* value, decrease was observed with soaking and increase with boiling, and finally, in b* value, decrease was observed with soaking and increase with boiling. High dietary fiber content, low trypsin inhibitory activity and high water absorption capacity were determined as the selection critea of the flours. Therefore, only the samples with the seed coat removed were taken as a potential ingredient for bread production. In bread production experiments, soaked and pregelatinized legume flours were added to wheat flour according to the principle of replacing 20% of the wheat flour. In all bread samples obtained, it was observed that the moisture level of the bread was suitable for the % moisture value requested in the Turkish Food Codex. Volume and baking loss values in breads containing 20% legume flour were found to be similar to the control bread. Although no statistically significant difference was observed, a decrease in the rapidly digestible starch fraction and an increase in the resistant starch fraction were observed in breads containing legume flour. Although it was observed that the sensory scores of the breads produced by mixing legume flours with cereal flours decreased ($p<0.05$) in some parameters, they were still acceptable. As a result, it was determined with this study that innovative food product components with high added value can be produced from legume residues with low commercial value. Turkey is one of the leading countries in legume production. Therefore, the utilization of these wastes has the potential to contribute to the economy.

Bitkisel Üretimin İklim Değişikliğinden Etkilenebilirliği ve Çözüm Önerisi Olarak Modern Biyoteknolojik Yaklaşımlar

Çağlar Kaya[1]

[1]Bahçe Bitkileri Bölümü, Ziraat Fakültesi, Çanakkale Onsekiz Mart Üniversitesi, Çanakkale, Türkiye

Özet

Bu çalışmanın amacı, iklim değişikliğinin bitkisel üretim üzerindeki olumsuz etkilerini incelemek ve bu etkileri azaltmak için modern biyoteknolojik yaklaşımların mekanizmalarını ve bitkilerde kullanımlarını ele almaktır. İklim değişikliği, artan sıcaklıklar, kuraklık, aşırı yağışlar ve diğer çevresel stres faktörleri nedeniyle bitkisel üretimde büyük kayıplara yol açmaktadır. Bu durum, gıda güvenliği ve tarımsal sürdürülebilirlik açısından ciddi tehditler oluşturmaktadır. Özellikle, CRISPR-Cas9 ve RNA interference (RNAi) gibi modern biyoteknolojik yöntemler, bitkilerin çevresel streslere karşı dirençli hale getirilmesinde önemli bir rol oynamaktadır. CRISPR-Cas9 teknolojisi, bitkilerin genetik yapısında hassas düzenlemeler yaparak, hastalık-zararlılar, kuraklık, yüksek sıcaklık ve tuzluluk gibi biyotik ve abiyotik faktörlere karşı dayanıklılık sağlamaktadır. RNAi ise, hedef genlerin ekspresyonunu baskılayarak, hastalık direncini artırmak ve çevresel streslere karşı dayanıklılığı güçlendirmek için kullanılmaktadır. Bu biyoteknolojik yaklaşımlar, bitkisel üretimin sürdürülebilirliğini sağlamak ve gıda güvenliğini artırmak için büyük bir potansiyele sahiptir. Ancak, bu kapsamdaki çalışmaların ulusal ve uluslararası daha fazla yaygınlaşması ve desteklenmesi gerekmektedir. İklim değişikliği ile başa çıkabilmek için biyoteknoloji alanındaki araştırmaların artırılması, yenilikçi çözümlerin geliştirilmesi ve tarımda daha geniş bir uygulama alanı bulması önemlidir. Bu alandaki yatırımlar, hem tarımsal verimliliğin artırılmasına hem de çevresel sürdürülebilirliğin sağlanmasına katkıda bulunacaktır.

The Effects of Functional Foods on Human Health

Şehnaz Özatay, Çağlar Kaya

Bahçe Bitkileri Bölümü, Ziraat Fakültesi, Çanakkale Onsekiz Mart Üniversitesi, Çanakkale, Türkiye

Abstract

Functional foods provide health benefits beyond basic nutrition due to their bioactive compounds. These foods can help prevent chronic diseases, enhance immune function, and improve overall well-being. In recent years, the interest in functional foods has significantly increased due to their potential role in disease prevention and health promotion. Functional foods contain biologically active compounds, such as probiotics, prebiotics, polyphenols, and omega-3 fatty acids, which contribute to improved physiological functions. This study discusses the types of functional foods, their bioactive components, and their effects on human health, focusing on cardiovascular health, gut microbiota, metabolic disorders, and cognitive function. The potential future developments in functional food research are also explored.

Özet

Fonksiyonel gıdalar, biyoaktif bileşikleri sayesinde temel beslenmenin ötesinde sağlık yararları sağlar. Bu gıdalar kronik hastalıkları önlemeye, bağışıklık fonksiyonunu geliştirmeye ve genel refahı iyileştirmeye yardımcı olabilir. Son yıllarda, hastalıkların önlenmesi ve sağlığın geliştirilmesindeki potansiyel rolleri nedeniyle fonksiyonel gıdalara olan ilgi önemli ölçüde artmıştır. Fonksiyonel gıdalar, gelişmiş fizyolojik işlevlere katkıda bulunan probiyotikler, prebiyotikler, polifenoller ve omega-3 yağ asitleri gibi biyolojik olarak aktif bileşikler içerir. Bu çalışma, fonksiyonel gıdaların türlerini, biyoaktif bileşenlerini ve insan sağlığı üzerindeki etkilerini tartışmakta ve kardiyovasküler sağlık, bağırsak mikrobiyotası, metabolik bozukluklar ve bilişsel işleve odaklanmaktadır. Fonksiyonel gıda araştırmalarındaki potansiyel gelişmelerde araştırılmaya devam edilmektedir.

Lemna minor L. (Duckweed) Importance and Usages

İlkay Yavaş[1], Hayrettin İlker Özdemir[1], Sıdıka Ekren[2]

[1]Aydın Adnan Menderes University, Koçarlı Vocational School, Department of Plant and Animal Production, Medicinal and Aromatic Plants Program, 09100, Türkiye
[2]Ege University, Faculty of Agriculture Department of Field Crops

Abstract

Duckweed (*Lemna minor*) is a plant with a wide range of potential uses in many areas due to its environmental benefits and economic value. This plant is effectively used in bioremediation processes, where it improves water quality by absorbing nitrogen, phosphorus, and other nutrients in water. It also removes toxic substances, such as heavy metals and organic pollutants, from water. In addition to its use in water treatment, duckweed is a valuable feed source for chickens, pigs, fish, and other farm animals due to its high protein content. Its application in biofuel production, enabled by its high starch content, makes it a promising alternative to traditional biofuel sources due to its rapid growth rate and high yield potential. Furthermore, duckweed is evaluated as a soil conditioner and organic fertilizer in agriculture, where it enhances soil fertility through its high nitrogen and phosphorus content. Its application as a soil conditioner and organic fertilizer in agriculture has been demonstrated by its ability to increase soil fertility when dried and ground, thereby supporting plant growth. Furthermore, duckweed has been shown to enhance the water-holding capacity of the soil and increase resistance to drought.

Key Words: *Bioremediation, biofuel, animal feed, Lemna minor*

Lemna minor L. (Su Mercimeği) Önemi ve Kullanım Alanları

Özet

Su mercimeği (*Lemna minor*), çevresel faydaları ve ekonomik potansiyeli nedeniyle birçok alanda geniş kullanım imkânı sunan bir bitkidir. Biyoremediasyon süreçlerinde etkin bir şekilde kullanılan bu bitki, sudaki azot, fosfor ve diğer besin maddelerini absorbe ederek su kalitesini iyileştirir. Aynı zamanda ağır metaller ve organik kirleticiler gibi toksik maddelerin sudan uzaklaştırılmasını sağlar. Yüksek protein içeriği ile tavuklar, domuzlar, balıklar ve diğer çiftlik hayvanları için değerli bir yem kaynağıdır. Biyoyakıt üretimi için de potansiyel bir kaynak olan su mercimeği, yüksek nişasta içeriği sayesinde biyoetanol üretiminde kullanılabilir. Hızlı büyüme oranı ve yüksek verim potansiyeli ile geleneksel biyoyakıt kaynaklarına alternatif olarak kabul edilmektedir. Tarımda toprak düzenleyici ve organik gübre olarak değerlendirilen su mercimeği, yüksek azot ve fosfor içeriği ile toprağın besin değerini artırmaktadır. Kurutulmuş ve öğütülmüş su mercimeği uygulamaları, toprağa ilave edildiğinde toprağın verimliliğini artırmakta ve bitki büyümesini desteklemektedir. Ayrıca toprağın su tutma kapasitesini de artırarak kuraklığa karşı direnci artırmaktadır.

Anahtar Kelimeler: *Biyoremediasyon, biyoyakıt, hayvan yemi, Lemna minor*

Giriş

Dünya genelinde, su mercimeği üzerine birçok araştırma ve proje yürütülmektedir. Özellikle, biyoremediasyon, biyoyakıt üretimi ve hayvan yemi olarak kullanımı üzerine odaklanan çalışmalar, su mercimeğinin potansiyelini ortaya koymaktadır. ABD, Çin ve Hindistan gibi ülkelerde, su mercimeği kullanılarak atık su arıtma sistemleri geliştirilmiş ve bu sistemler endüstriyel ve tarımsal atık suların temizlenmesinde başarılı sonuçlar vermiştir. Ayrıca, Avrupa Birliği tarafından finanse edilen projelerde, su mercimeğinden biyoyakıt üretimi üzerine çalışmalar yapılmaktadır. Bu projeler, su mercimeğinin sürdürülebilir bir enerji kaynağı olarak kullanılmasını hedeflemektedir (Cheng ve Stomp, 2009; Xu ve Shen, 2011).

Türkiye'de, su mercimeği üzerine yapılan çalışmalar henüz yeni yeni gelişmektedir. Ancak, son yıllarda, su mercimeğinin biyoremediasyon, hayvan yemi ve biyoyakıt üretimi gibi alanlarda kullanımı üzerine araştırmalar artmaktadır. Özellikle, üniversiteler ve araştırma enstitüleri tarafından yürütülen projeler, su mercimeğinin Türkiye'deki potansiyelini ortaya koymaktadır. Örneğin, bazı üniversitelerde, su mercimeği kullanılarak atık su arıtma sistemleri geliştirilmiş ve bu sistemler, tarımsal ve endüstriyel atık suların temizlenmesinde başarılı sonuçlar vermiştir. Ayrıca, su mercimeğinin hayvan yemi olarak kullanımı üzerine yapılan çalışmalar, bitkinin çiftlik hayvanları için değerli bir besin kaynağı olduğunu göstermiştir (Takács ve ark., 2025).

Su mercimeği, sadece çevresel faydaları ile değil, aynı zamanda ekonomik potansiyeli ile de dikkat çekmektedir. Bu bitki, hızlı büyüme oranı, yüksek protein içeriği ve biyoremediasyon yetenekleri ile sürdürülebilir tarım ve endüstriyel uygulamalar için önemli bir kaynak olarak kabul edilmektedir. Bu nedenle, su mercimeği üzerine yapılan araştırmalar hem çevresel sorunların çözümüne hem de ekonomik fırsatların değerlendirilmesine katkı sağlamaktadır.

Su Mercimeğinin Yapısı, Büyüme Döngüsü ve Üreme Şekli

Lemna cinsi, yaygın olarak su mercimeği olarak bilinen, Lemnaceae familyasına ait küçük, yüzen su bitkileridir. Su mercimeği, basit yapılı bir bitki olup, her bir bitki bir veya birkaç yapraksı yapıdan oluşmaktadır. Bu yapılar, su yüzeyinde yüzer ve fotosentez için gerekli olan klorofil içerir. Su mercimeği, kök benzeri yapılar (rizoidler) ile suda dengede durur, ancak bu yapılar gerçek kökler değildir ve besin alımından çok denge sağlamaya yöneliktir (Coşkun et al, 2018).

Su mercimeği, vejetatif üreme yoluyla hızla çoğalmaktadır. Bu üreme şeklinde, ana bitkiden ayrılan yeni yapraksı yapılar, bağımsız bitkiler haline gelmektedir. Bu süreç, uygun koşullarda çok hızlı gerçekleşmekte ve su mercimeği popülasyonları kısa sürede büyük alanlara yayılmaktadır. Ayrıca, bazı *Lemna* türleri, çiçekli bitkiler olmalarına rağmen, çiçeklenme ve tohum üretimi nadiren gözlenmektedir (Landolt, 1986).

Su Mercimeğinin Doğal Ekosistemlerdeki Rolü ve Diğer Canlılarla İlişkisi

Su mercimeği, doğal ekosistemlerde önemli bir rol oynamaktadır Su yüzeyinde yoğun bir şekilde büyüyerek, suyun ışık geçirgenliğini azaltmakta ve bu da su altı bitkilerinin büyümesini sınırlayabilmektedir. Ancak, su mercimeği aynı zamanda sucul ekosistemlerdeki besin döngüsüne katkıda bulunmaktadır. Özellikle, azot ve fosfor gibi besin maddelerini sudan alarak, suyun besin yükünü azaltmakta ve bu da ötrofikasyonun önlenmesine yardımcı olmaktadır (Zimmo ve ark., 2004).

Bu bitki, sucul ekosistemlerdeki birçok canlı için önemli bir besin kaynağıdır. Balıklar, su kuşları ve diğer sucul organizmalar, su mercimeği ile beslenmektedir. Ayrıca, su mercimeği, mikroorganizmalar için bir yaşam alanı sağlamakta ve sucul ekosistemlerdeki biyolojik çeşitliliği desteklemektedir (Sulaiman ve ark., 2025).

Su Mercimeği Yetiştirme Koşulları ve Yöntemleri

Su Kalitesi, Sıcaklık, Işıklanma ve Besin Gereksinimleri

Su mercimeği yetiştiriciliği için uygun bir ortam sağlamak, bitkinin sağlıklı büyümesi ve yüksek verim elde edilmesi açısından kritik öneme sahiptir. Su mercimeği, genellikle tatlı su kaynaklarında yetişmekte, su kalitesini ve büyüme durumunu doğrudan etkilemektedir. Suyun pH değeri, 6.0-7.5 aralığında olmalıdır. Ayrıca, suda yeterli miktarda azot (N) ve fosfor (P) bulunması, bitkinin hızlı büyümesini sağlamaktadır (Cheng ve Stomp, 2009).

Sıcaklık, su mercimeği yetiştiriciliğinde önemli bir faktördür. Optimum büyüme sıcaklığı, 20-30°C aralığındadır. Sıcaklığın bu aralığın altına düşmesi, büyüme hızını yavaşlatırken, yüksek sıcaklıklar ise bitkinin stres altına girmesine neden olmaktadır (Baek ve ark., 2021)

Işıklanma, su mercimeğinin fotosentez yapması için gereklidir. Bitki, günde en az 12-16 saat ışık almalıdır. Doğal güneş ışığı, en iyi büyüme sonuçlarını sağlamaktadır. Fakat yapay ışıklandırma sistemleri de kullanılabilir. Işık yoğunluğu, 1000-2000 lux aralığında olmalıdır (Petersen, 2022).

Besin ihtiyacı açısından, su mercimeği azot ve fosfor gibi makro besinlerin yanı sıra potasyum, kalsiyum ve magnezyum gibi mikro besinlere de ihtiyaç duymaktadır. Bu besinler, bitkinin hızlı büyümesi ve yüksek verim elde edilmesi için gereklidir (Xu ve Shen, 2011).

Su Mercimeği Yetiştirme Teknikleri ve Saklama Koşulları

Su mercimeği, çeşitli yetiştirme sistemlerinde yetiştirilebilir. Laboratuvar ortamında, kontrollü koşullar altında su mercimeği yetiştirilerek, bitkinin büyüme parametreleri ve besin gereksinimleri üzerine detaylı çalışmalar yapılabilir. Laboratuvar ortamında, su mercimeği genellikle cam kaplar veya plastik kaplar içinde yetiştirilmekte ve suyun sıcaklığı, pH'ı ve besin içeriği sürekli olarak izlenmektedir (Pagliuso ve ark., 2022).

Açık havuzlarda su mercimeği yetiştiriciliği, daha büyük ölçekli üretim için uygundur. Bu yöntemde, su mercimeği, doğal veya yapay olarak oluşturulmuş havuzlarda yetiştirilir. Havuzların derinliği genellikle 20-50 cm arasında değişir ve suyun sürekli olarak karıştırılması, bitkinin homojen bir şekilde büyümesini sağlar. Açık havuzlarda yetiştiricilik, düşük maliyetli bir yöntemdir, ancak çevresel faktörler (sıcaklık, yağış gibi) bitkinin büyümesini etkileyebilir (Anim ve ark., 2025).

Diğer yetiştirme sistemleri arasında, kapalı sistemler (biyoreaktörler vs.) ve yüzen platformlar bulunur. Kapalı sistemler, su mercimeğinin kontrollü koşullar altında yetiştirilmesini sağlamakta ve bu da yüksek verim elde edilmesine olanak tanımaktadır. Yüzen platformlar ise, su mercimeğinin doğal su kaynaklarında yetiştirilmesi için kullanılmaktadır ve bu yöntem, suyun kalitesini iyileştirmek amacıyla da değerlendirilebilir (Cheng ve Stomp, 2009).

Su mercimeği, hızlı büyüme oranı nedeniyle kısa sürede hasat edilebilmektedir. Hasat zamanı, bitkinin büyüme hızına ve yetiştirme koşullarına bağlı olarak değişmektedir. Genellikle, su mercimeği, 5-7 günlük bir büyüme

periyodundan sonra hasat edilebilir. Hasat işlemi, bitkinin su yüzeyinden toplanması şeklinde gerçekleştirilir. Bu işlem, elle veya mekanik yöntemlerle yapılabilir. Hasat edilen su mercimeği, çeşitli şekillerde saklanabilir. Taze olarak kullanılacak su mercimeği, buzdolabında birkaç gün saklanabilir. Uzun süreli saklama için, su mercimeği kurutulabilir veya dondurulabilir. Kurutulmuş su mercimeği, öğütülerek toz haline getirilebilir ve bu toz, hayvan yemi veya gübre olarak kullanılabilir. Dondurulmuş su mercimeği ise, daha sonra kullanılmak üzere saklanabilir (Cheng ve Stomp, 2009).

Su Mercimeğinin Kullanım Alanları

Biyoremediasyon

Su mercimeği biyoremediasyon süreçlerinde oldukça etkili bir şekilde kullanılabilen bir bitkidir. Bu bitki, sudaki azot, fosfor ve diğer besin maddelerini absorbe ederek su kalitesini önemli ölçüde iyileştirebilir. Ayrıca, su mercimeği, ağır metaller (kurşun, kadmiyum, cıva vb.) ve organik kirleticiler (pestisitler, endüstriyel kimyasallar vb.) gibi toksik maddeleri de sudan uzaklaştırabilir. Bu özellikleri nedeniyle, su mercimeği, atık su arıtma tesislerinde ve kirletilmiş su kaynaklarının temizlenmesinde yaygın olarak kullanılmaktadır (Zimmo ve ark., 2004). Yang (2022) tarafından yapılan bir araştırmada, su mercimeğinin pestisitler gibi organik kirleticileri sudan %80 oranında uzaklaştırabildiği belirtilmiştir. Bu bulgular, su mercimeğinin organik kirleticilerin giderilmesinde de oldukça etkili olduğunu göstermektedir. Ayrıca, Smith ve Moelyowati (2021) tarafından yapılan bir çalışmada, su mercimeğinin endüstriyel atık suların arıtılmasındaki rolü incelenmiş ve bitkinin azot ve fosfor gideriminde oldukça etkili olduğu raporlanmıştır. Bu çalışma, su mercimeğinin biyoremediasyon süreçlerindeki önemini ve çeşitli kirleticilerin giderilmesindeki etkinliğini ortaya koymaktadır. Su mercimeği, özellikle atık su arıtma ve kirletilmiş su kaynaklarının temizlenmesi gibi alanlarda çevre dostu bir çözüm olarak kullanılmaya devam etmektedir.

Hayvan Yemi

Su mercimeği (*Lemna* spp.), yüksek protein içeriği (%20-45) ve zengin besin profili nedeniyle hayvan yemi olarak yaygın bir şekilde kullanılmaktadır. Bitki, amino asitler, vitaminler (örneğin, A, B, C vitaminleri) ve mineraller (kalsiyum, magnezyum, demir gibi) açısından oldukça zengin bir kaynaktır. Bu özellikleriyle su mercimeği, tavuklar, domuzlar, balıklar ve diğer çiftlik hayvanları için değerli bir yem alternatifi sunmaktadır. Hayvanlar üzerinde yapılan çalışmalar, su mercimeği ile beslenen hayvanların büyüme performansının arttığını ve bağışıklık sistemlerinin güçlendiğini göstermiştir (Leng ve ark., 1995). Mwale ve Gwaze (2023) tarafından yapılan bir çalışmada, su mercimeği ile beslenen tavukların büyüme performansının %15-20 oranında arttığı belirtilmiştir. Bu çalışma, su mercimeğinin kümes hayvanları için besleyici bir yem kaynağı olduğunu kanıtlamıştır. Takács ve ark. (2025) tarafından yürütülen bir araştırmada ise, su mercimeğinin domuz yeminde kullanımının, hayvanların bağışıklık sistemini güçlendirdiği ve hastalık direncini artırdığı vurgulanmıştır. Bu bulgular, su mercimeğinin domuz yetiştiriciliğinde sağlık ve performans açısından önemli faydalar sağladığını ortaya koymaktadır. Bir başka çalışmada ise, su mercimeği ile beslenen balıkların büyüme hızının %25 oranında arttığı ve yem maliyetlerinin düştüğü raporlanmıştır (Sosa ve ark., 2024). Bu çalışma, su mercimeğinin su ürünleri yetiştiriciliğinde hem ekonomik hem de besin içeriği açıdan avantajlar sağladığını ortaya koymuştur. Yürütülen çalışmalar, su mercimeğinin hayvan yemi olarak kullanımının, hayvanların büyüme performansını artırmanın yanı sıra bağışıklık sistemlerini de güçlendirdiği ve yem maliyetlerini düşürme gibi önemli faydalar sağladığını ortaya koymaktadır. Bu nedenle su mercimeği, sürdürülebilir hayvancılık uygulamaları için değerli bir kaynak olarak ön plana çıkmaktadır.

Biyoyakıt Üretimi

Su mercimeği biyoyakıt üretimi için potansiyel bir kaynak olarak kabul edilmektedir. Bitki, yüksek nişasta içeriği nedeniyle biyoetanol üretiminde kullanılabilir. Biyoetanol üretimi için, su mercimeği önce fermente edilir ve ardından damıtma işlemi ile etanol elde edilir. Su mercimeği, hızlı büyüme oranı ve yüksek verim potansiyeli nedeniyle, geleneksel biyoyakıt kaynaklarına (örneğin, mısır, şeker kamışı) alternatif olarak görülmektedir. Ayrıca, su mercimeği yetiştiriciliği, tarım arazileri üzerinde baskı oluşturmadan gerçekleştirilebilir, bu da onu sürdürülebilir bir enerji kaynağı haline getirmektedir (Xu ve Shen, 2011). Son yıllarda yapılan çalışmalar, su mercimeğinin biyoyakıt üretimindeki potansiyelini daha da detaylı bir şekilde ortaya koymuştur. Cui ve ark. (2020) tarafından yapılan bir çalışmada, su mercimeğinin yüksek nişasta içeriği nedeniyle verimli bir biyoyakıt kaynağı olduğu vurgulanmıştır. Başka bir çalışma su mercimeğinin yağ içeriğinin yüksek olduğunu ve biyodizel üretimi için değerli bir kaynak olabileceğini ortaya koymuştur (Krzywonos et al. 2023). Chusov ve ark. (2022) tarafından ise su mercimeğinin biyogaz üretimindeki etkinliği araştırılmış ve bitkinin yüksek organik madde içeriği nedeniyle verimli bir kaynak olduğu bildirilmiştir. Biyoetanol, biyodizel ve biyogaz gibi farklı biyoyakıt türlerinin üretimi için potansiyel bir kaynak olan su mercimeği, hızlı büyüme oranı, yüksek verimliliği ve tarım arazileri üzerinde baskı oluşturmaması nedeniyle sürdürülebilir bir enerji kaynağı olarak dikkat çekmektedir.

Su Ürünleri Yetiştiriciliği

Su mercimeği, balıklar ve diğer su canlıları için zengin bir besin kaynağıdır. Özellikle tilapia, sazan ve somon gibi balık türleri, su mercimeği ile beslenmektedirler. Bu bitki, balıkların büyüme hızını artırmakta ve bağışıklık sistemlerini güçlendirmektedir. Ayrıca, su ürünleri yetiştiriciliğinde kullanılan yem maliyetlerini düşürerek ekonomik olarak avantaj sağlamaktadır (Leng ve ark., 1995). Opiyo ve ark. (2022) tarafından yapılan bir çalışmada, su mercimeği ile beslenen tilapia balıklarının büyüme hızının %20 oranında arttığı gözlenmiştir. Su mercimeği ile yürütülen bir başka çalışmada ise, sazan balıklarının bağışıklık sisteminin güçlendiği, böylece hastalık direncini artırdığı belirlenmiştir (Goswami ve ark., 2022). Jaimes Prada ve ark. (2024) tarafından yapılan bir çalışmada ise, su mercimeği ile beslenen balıkların yem maliyetlerinin önemli ölçüde düştüğü, ekonomik bir yem alternatifi olarak kullanılabileceği saptanmıştır.

Tarım

Su mercimeği (*Lemna* spp.), tarımda toprak düzenleyici ve organik gübre olarak kullanılabilen önemli bir bitkidir. Bitki, yüksek azot ve fosfor içeriği nedeniyle toprağın besin değerini artırmaktadır. Kurutulmuş ve öğütülmüş su mercimeği, toprağa karıştırılarak kullanılabilmektedir. Bu uygulama, toprağın verimliliğini artırmakta ve bitkilerin büyümesini desteklemektedir. Ayrıca, su mercimeği, toprağın su tutma kapasitesini artırarak kuraklığa karşı direnci de artırmaktadır (Xu ve Shen, 2011). Fernandez Pulido ve ark. (2024) tarafından yürütülen bir çalışmada, su mercimeği ile gübrelenen topraklarda bitki büyümesinin önemli ölçüde arttığı vurgulanmıştır. Baldi ve ark. (2025) yılında yürüttükleri çalışmalarında su mercimeğinin özellikle kurak bölgelerde toprağın su tutma kapasitesini artırarak tarımsal üretimi iyileştirdiğini ortaya koymuşlardır. Benzer sonuçlar Thingujam ve ark. (2024) tarafından yürütülen çalışma sonucunda da elde edilmiştir.

Sonuç

Su mercimeği, çevresel ve ekonomik açıdan önemli bir potansiyele sahiptir. Bitki, biyoremediasyon, hayvan yemi, biyoyakıt üretimi ve tarım gibi farklı alanlarda kullanılabilmektedir. Gelecekte, su mercimeği üzerine yapılacak araştırma ve geliştirme çalışmaları, bitkinin kullanım alanlarını artırabilir ve sürdürülebilir bir kaynak olarak değerini iyileştirebilir. Özellikle, su mercimeğinin genetik mühendisliği yöntemleri ile iyileştirilmesi, bitkinin büyüme hızını ve besin içeriğini de artırabilir. Ayrıca, su mercimeğinin endüstriyel ölçekte yetiştirilmesi ve işlenmesi için yeni teknolojilerin ortaya konması bitkinin ticari değerini de artıracaktır. Su mercimeği yetiştiriciliği yaparken su kalitesinin de takip edilmesi gerekmektedir. Böylelikle bitki için ideal olan su pH'sı, sıcaklığı, besin içeriği sağlanmış olacaktır. Ayrıca uygun büyüme döngüsünde bitkiler hasat edilip, uygun koşullarda saklanmalıdır. Su mercimeği yetiştiriciliği yaparken doğal ekosistemler üzerinde olumsuz etkiler yaratabilecek olmasından dolayı çevresel etkilerde göz önünde bulundurulmalıdır. Su mercimeğinin kullanım alanları ve yetiştiriciliği konusunda çiftçiler, araştırıcılar ve diğer paydaşlar bilinçlendirilmelidir. Bu, su mercimeğinin daha yaygın bir şekilde kullanılmasını sağlayabilir. Sonuç olarak, su mercimeği, çevresel ve ekonomik açıdan büyük bir potansiyele sahiptir. Doğru yetiştirme ve kullanım yöntemleri ile su mercimeği, sürdürülebilir bir kaynak olarak değerlendirilebilir ve gelecekte birçok alanda kullanılabilir.

Abstract

Initially, a LINTUL crop growth model version was developed, validated, and applied to explore the effects of global warming on potato crop yield.With seven crops (wheat, soy, maize, cotton, sugar beet, rice, and potatoes) being used as an example in the case of Türkiye, the study aimed to broaden the applicability of the most recent LINTUL model to additional crops. The model's inputs include the present dates of planting or sowing and harvest for each crop in a relevant cropping ecology, the base temperature below which no development takes place, the number of degree days between planting and emergence and between emergence and full ground cover, the harvest index, the efficiency of radiation use, and the dry matter amount of the produce. By 2050, it was projected that the parameter values for climate change-related inputs will result in a 2°C rise in temperature and a 200 ppm rise in CO_2 concentration. The model investigated variations in agricultural productivity and water usage with and without adaptation, such as adjusting each crop's growth season. The latest version of the LINTUL model predicts that the wheat crop would have a shorter season for growth and decreased yields in the 2050s, whereas the other plants under investigation will have a longer growing season and better yields. Wheat, rice, soybeans, and sugar beet will all require more irrigation, but cotton, potatoes, and other cotton-related crops would require less irrigation. The future projections of seven economically important crops for Türkiye should be used by producers, the industry, and policymakers worldwide to plan, invest in, develop, and prevent the negative consequences of climate change.

Abstract

This study investigates the comparative efficacy of two dehydration methods, solar tunnel drying and hot air cabinet drying, in enhancing the shelf life of three apple cultivars: Gala, Red Delicious, and Golden Delicious. Drying processes were conducted over intervals of 12, 15, 18, 21, and 24 hours to identify the optimal drying duration for each method and cultivar. Both techniques significantly reduced moisture content, thereby extending shelf life; however, notable differences in drying efficiency and product quality were observed. Hot air cabinet drying, characterized by consistent and controlled environmental conditions, facilitated a more uniform reduction in moisture content. Treatment T5 (hot air cabinet, 24 hours) consistently achieved the lowest moisture content across all time points, whereas, T6 (solar tunnel, 12 hours) exhibited the highest residual moisture levels but demonstrated superior preservation of nutritional constituents, particularly minerals. Hot air cabinet drying also maintained the apples' original color and flavor more effectively, benefiting from its independence from solar radiation variability. In contrast, solar tunnel drying was more cost-effective and environmentally friendly. Optimal drying times varied by cultivar: Red Delicious and Gala required 12-15 hours (hot air) and 24 hours (solar tunnel), whereas, Golden Delicious achieved optimal results at 18 hours (hot air) and 21 hours (solar tunnel). The study concludes that hot air cabinet drying for 15 hours is most effective for maximizing shelf life and quality, yielding moisture contents of 12.2% for Golden Delicious, 13.0% for Red Delicious, and 11.5% for Gala. These findings underscore the trade-offs between drying efficiency, product quality, and environmental sustainability, providing valuable insights for optimizing dehydration processes in apple preservation.

Level of Utilization of Agritech Services by Rice Farmers in Niger State, Nigeria

Fasina, O.O. and Adewale, M.D.

Department of Agricultural Extension and Communication Technology,
Federal University of Technology
P.M.B 704, Akure, Ondo State, Nigeria
Corresponding Author: royalambfuta@gmail.com

Abstract

The integration of technology into agriculture has significantly transformed farming practices. However, many farmers still rely on traditional methods, limiting their productivity. This study assesses the level of utilization of agritech services by rice farmers in Niger State, Nigeria. A multistage sampling technique was employed to select 120 respondents from three local government areas. Data were collected using structured questionnaires and analyzed using descriptive statistics, correlation, and chi-square tests. Findings revealed farming experience had a significant positive correlation with the level of agritech utilization ($r = 0.303$, $p = 0.001$). The chi-square analysis indicated a significant association between gender and agritech utilization ($\chi^2 = 4.335$, $p = 0.037$), with male farmers demonstrating a higher level of adoption compared to female farmers. The study highlights the need for targeted awareness campaigns and institutional support to enhance agritech adoption, particularly among female and less-experienced farmers, to improve agricultural productivity.

Protective Community Index as a Measure for Child Labour: A Case Study of Cocoa-Producing Communities in Idanre Local Government Area, Ondo State

O.O. Fasina and T.K. Olafisoye

Department of Agricultural Extension and Communication, School of Agriculture and Agricultural Technology, Federal University of Technology, Akure, Nigeria
timileyinolafisoye@gmail.com

Abstract

This study investigated the Protective Community Index (PCI) of cocoa-producing communities in the Idanre Local Government Area of Ondo State, Nigeria. The Protective Community Index serves as a tool for evaluating community resilience and child protection mechanisms, especially in the context of child labor. This study ascertained the socioeconomic characteristics of respondents, determined the level of children's involvement in cocoa production activities, identified the availability of social amenities, and identified the available supporting welfare structures that protect and support children in cocoa-producing communities. Primary data were collected through purposive sampling from 168 respondents, including community leaders, cocoa farmers, teachers, and children across eight cocoa-producing communities. Structured questionnaires were used to gather accurate information. Data analysis involved descriptive statistics, such as frequency, percentage, and mean, alongside inferential statistics, including Pearson Product Moment Correlation, to test hypotheses at a significance level of $p < 0.05$. PCI was measured using a tool developed by the International Cocoa Initiative (ICI). The findings revealed that The Protective Community Index (PCI) of the studied communities was moderate (57.6%). Cocoa farming and community leadership were dominated by middle-aged and older men, while teaching roles comprised a female majority (73.2%). Child labor, although not prevalent in hazardous activities, was linked to a school absenteeism rate of 5.4%. Children's involvement in cocoa farming activities was low, with an average (mean) participation score of 16.74. The study also highlighted the inadequacies in social amenities, such as water and healthcare, and insufficient welfare structures, including scholarships and feeding programs. This study emphasizes the need for increased youth engagement in agriculture, gender equality in leadership roles, improved access to quality education, and enhanced social amenities to foster child protection and sustainable community development.

Key words: *Protective Community Index, child labor, cocoa production, social amenities, welfare systems*

Introduction

Child labor remains a critical global issue with profound social, economic, and ethical implications. Work deprives children of their childhood, interferes with their education, and jeopardizes their physical and mental well-being (ILO, 2020). According to UNICEF, sub-Saharan Africa has the highest prevalence of child labor, with over 70% of these children working in agriculture, often under hazardous conditions (UNICEF 2023). Cocoa farming, as a major sector in agriculture, has consistently drawn attention for its reliance on child labor. Addressing child labor in cocoa-producing regions is essential not only for protecting children's rights, but also for ensuring sustainable agricultural development. In Nigeria, a significant cocoa producer, the issue persists, particularly in rural communities such as the Idanre Local Government Area in Ondo State. This study focused on understanding the protective mechanisms available within these communities and offered a pathway for informed interventions.

Previous studies have extensively documented the prevalence and drivers of child labor in cocoa-producing regions. Numerous studies have focused on countries such as Côte d'Ivoire and Ghana, which together account for nearly 60% of the global cocoa supply. Reports indicate that over 1.5 million children are engaged in hazardous activities on cocoa farms in these countries, driven by poverty, inadequate access to education, and entrenched cultural norms (Human Rights Watch, 2020; NORC, 2020). These studies have provided valuable insights into the socioeconomic conditions that perpetuate child labor. However, they often neglect the role of community resilience and protective structures, which are crucial for mitigating risks and supporting child welfare. The introduction of the Protective Community Index (PCI) by the International Cocoa Initiative (ICI) represents a significant step toward addressing this gap. The PCI serves as a tool to evaluate the resilience of cocoa-growing communities, focusing on access to education, healthcare, and social infrastructure that can reduce child labor risks (ICI, 2023). Despite its potential, there have been limited applications of the PCI framework in Nigerian cocoa-producing communities, highlighting a critical gap in the literature.

The issue of child labor in cocoa-producing communities in Nigeria, is compounded by several systemic challenges. These include insufficient social amenities such as clean water and healthcare facilities, weak enforcement of child labor laws, and cultural practices that normalize children's involvement in farming activities. Although child labor contributes to immediate family income, it comes at a significant cost to children's education, health, and future opportunities. Studies suggest that strengthening community-based protective structures can play a pivotal role in reducing vulnerability (ILO, 2020; UNICEF, 2023). Therefore, this study aims to address this knowledge gap by investigating the protective mechanisms within Idanre's cocoa-producing communities and evaluating their effectiveness using the PCI framework. This study distinguishes itself from previous studies by focusing on the resilience and protective capacity of communities rather than merely documenting the prevalence of child labor. Specifically, it evaluates the availability and quality of social amenities and welfare systems within the cocoa-producing communities. By assessing these factors through the PCI lens, this study aimed to provide actionable insights for stakeholders, including policymakers, non-governmental organizations, and community leaders, to design targeted interventions that enhance child protection and foster sustainable community development. This study addresses a critical gap in the literature by focusing on the protective capacity of the cocoa-producing communities in Nigeria. The application of PCI seeks to illuminate pathways to reduce child labor risks and improve community resilience. The findings are expected to contribute significantly to the discourse on child labor, providing evidence-based recommendations for creating safer and more supportive environments for children in agricultural settings.

Materials and Methods

Study Area

This study was conducted in the Idanre Local Government Area, Ondo State, Nigeria, which is a significant cocoa-producing region in the southwestern part of the country, Nigeria. Ondo State is the largest cocoa producer in Nigeria and contributes significantly to its cocoa exports. Idanre, in particular, is characterized by its extensive cocoa farms and rural communities, where cocoa farming serves as the primary source of livelihood. The local climate, with distinct rainy and dry seasons, supports the cultivation of cocoa.

Population of the Study

The target populations were all cocoa-producing communities, including community leaders, farmers, teachers, and children, within the selected communities in the Idanre. These groups of people were chosen to provide diverse perspectives on child labor and community resilience.

Sampling Techniques (Sampling Procedure & Size)

A purposive sampling method was employed to select the respondents. Idanre Local Government Area was selected because of its prominence in cocoa production in the state. Eight cocoa-producing communities within Idanre were purposively selected to represent the area's cocoa-farming activities based on production capacities. Subsequently, 21 respondents were selected from each community, comprising one community leader, five teachers, five cocoa farmers, and ten children aged 5 to 17 years. This approach ensured representation across key stakeholders, resulting in a sample size of 168 respondents.

Method of Data Collection

Primary data were collected using structured questionnaires designed to gather information on the socioeconomic characteristics, level of children's involvement in cocoa production, availability of social amenities, and welfare structures in the eight cocoa-producing communities. The questionnaires were tailored to different respondent categories, including community leaders, farmers, teachers, and children, to ensure relevance and clarity. Data collection was conducted over a defined period with trained enumerators administering the questionnaires to ensure accuracy and consistency.

Measurement of Variables

This study measured both the dependent and independent variables:

- **Dependent Variable**: The Protective Community Index (PCI) was the dependent variable. It was measured using the tool developed by the International Cocoa Initiative (ICI). PCI measures community resilience based on factors such as access to quality education, healthcare, and other protective structures.
- **Independent Variables**: These included socioeconomic characteristics such as age, gender, ethnic group, marital status, family structure, household size, farm size, level of education, reasons for children's involvement in cocoa production activities, and the availability of social amenities and welfare structures within the communities.

Data Analysis

The collected data were analyzed using descriptive and inferential statistical techniques. Descriptive statistics, including frequency distributions, percentages, and means, were used to summarize respondents' socioeconomic characteristics and community features. Inferential statistics, specifically Pearson product-moment correlation, were employed to test the hypotheses and determine the relationships between variables. The significance level was set at $P < 0.05$.

Results

Socioeconomic Characteristics of Respondents

The demographic characteristics of the respondents provided valuable insights into the social structure of cocoa-producing communities in the Idanre Local Government Area. Figure 1 highlights the respondents' age categories. This reveals that leadership roles were exclusively held by men aged 57-82 years, reflecting a traditional reliance on experience and seniority in community governance. Among the cocoa farmers, 50.4% were aged 44-56 years, while only 1% were between 18-30 years, underscoring a critical gap in youth participation. On the other hand, teachers were younger, with 70.8% aged 18-43 years, likely due to the profession's formal training requirements and appeal to younger demographics.

The sex distribution in Figure 2 highlights significant disparities. Leadership and farming were dominated by men (100% of community leaders and 91.8% of cocoa farmers), whereas teaching was predominantly female (73.2%).

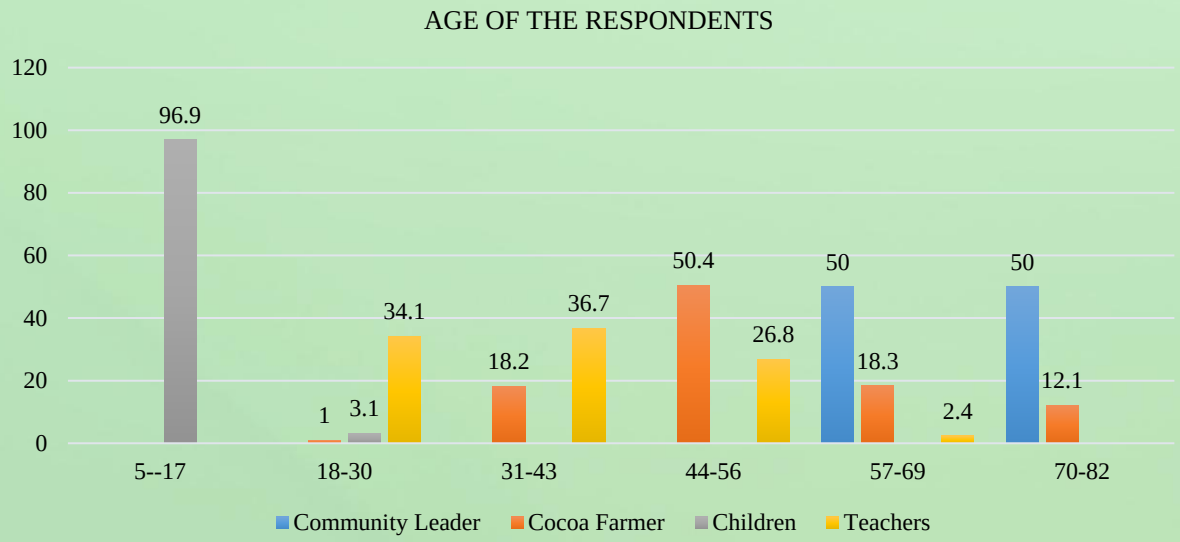

Figure 1. Frequency Distribution of the Age of the Respondents; Source: Field Survey, 2024

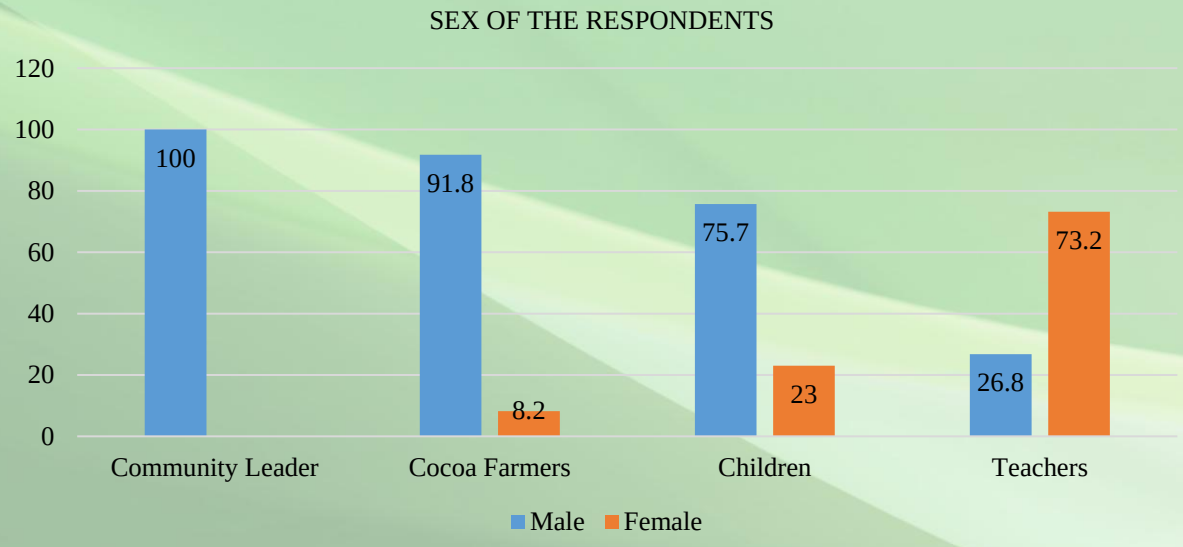

Figure 2. Frequency Distribution of the Sex of the Respondents; Source: Field Survey, 2024

The Level of Involvement of Children in Cocoa Production Activities

Table 1 shows that the level of involvement of children in cocoa production activities was minimal but notable, with 17.6% of the children engaging in cocoa production activities. The major activities include fetching water (mean = 2.11), the removal of cocoa beans (mean = 2.26), and turning fermented cocoa beans during the sun-drying process (mean = 2.36). Boys were more involved than girls, accounting for 75.7% of participants in cocoa production activities. The mean involvement score was 16.74 out of 50, indicating that most of the children's contributions were supplementary rather than central to farm operations.

Availability of Social Amenities and Welfare Structures in the Communities

Table 2 indicates that the availability of social amenities was inadequate, which was a significant challenge for the communities. Access to clean water was limited, with only 40% of respondents reporting reliable sources. Healthcare center facilities and services were similarly inadequate, with just 35% of communities having consistent access. Preschool availability was reported in 87.5% of the communities, and 75% had primary schools. Awareness programs addressing child labor were conducted in 75% of the communities, but no structured initiatives specifically targeting child labor reduction were available.

Availability of Supporting Structures for Children Welfare in the Communities

Table 3 shows that the welfare structures supporting children, such as scholarships (20%) and feeding initiatives or programs (15%), were scarce, reflecting systemic underinvestment in child welfare infrastructure. Only 41.5% of schools had separate restrooms for boys and girls, while none of the schools provided food for students. Additionally, scholarships for secondary education were available in only 14.6% of schools, and 9.8% of schools still employed corporal punishment as a disciplinary method.

Protective Community Index

The Protective Community Index (PCI) of the eight communities was moderate with an average score of 57.6%. This indicates that there is room for improvement in child protection and community resilience.

Hypothesis

H_{o1}: There is no significant relationship between the child's involvement in cocoa production and the Protective Community Index (PCI) of the study area.

The Relationship between Child Involvement in Cocoa Production and the PCI of the Study Area

Table 4 shows the results of the Pearson Product Moment Correlation (PPMC) analysis conducted to test this hypothesis. The results indicate that there is no significant relationship between the Protective Community Index (PCI) and child involvement in cocoa production activities (r = 0.06, p-value = 0.64).

Table 1. The Level of Involvement of Children in Cocoa Production Activities

Cocoa Production Activities	1 - 3 Hours F (%)	4 – 6 Hours F (%)	7 - 9 Hours F (%)	Mean
Nursery	45 (60.8)	9 (12.2)	1 (1.4)	1.94

Discussion

The gender imbalance in farming and leadership highlights persistent cultural norms that restrict women's participation in these roles, potentially limiting the inclusion of diverse perspectives in community decision making. The findings of this study provide critical insights into the dynamics (social and cultural norms) of cocoa-producing communities in the Idanre Local Government Area. The dominance of older men in leadership and farming roles aligns with traditional expectations of authority and physical labor. However, the low participation of youth in cocoa farming presents a critical challenge to the sustainability of cocoa production in Idanre. Young people's preference for urban employment opportunities underscores the need for policies that make agriculture more appealing through training, mechanization, and financial incentives. The low participation of adults in cocoa farming aligns with previous research highlighting youth migration to urban areas in search of alternative livelihoods (Amankwah et al. 2019).

Child labor in the study area, although limited and not widespread, remains a pressing concern. The fetching water activity involves providing water for various cocoa production processes or activities. It is straightforward and manageable for children, yet it demands physical effort and time that could otherwise be allocated to education. The removal of cocoa beans activity involves extracting beans from cocoa pods, an activity that requires handy work but not with physical strength, making it suitable for children. Although non-hazardous, excessive involvement could impact their school attendance. The turning of fermented cocoa beans activity is crucial in ensuring even drying during the sun-drying process. It is repetitive but not physically taxing, making it accessible for children. These activities are relatively simple and do not pose significant hazards to children. While these activities are non-hazardous, their implications for child labor must not be overlooked. Children's participation often aligns with household economic pressures, contributing to a school absenteeism rate of 5.4%. Although the activities are supplementary and do not directly endanger children, their involvement can disrupt educational continuity and overall development. The mean involvement score of 16.74 and 5.4% school absenteeism rate emphasize the need for targeted interventions to address the root causes of child labor, such as poverty and inadequate access to education. These findings suggest that economic pressures compel families to involve children in farm activities, although in a limited capacity. Gender disparities in child labor, with boys being more engaged, mirror the broader cultural expectations that assign physically demanding tasks to male children. Addressing these disparities requires community-specific strategies that balance economic needs with children's right to education and development. This finding shows the need for programs that address household economic needs while emphasizing the importance of education are critical. Awareness campaigns and community-based interventions can ensure children's involvement in cocoa production remains minimal and non-disruptive to their education in school and well-being.

Inadequacy of social amenities and welfare structures is a critical issue. The implications of these findings are significant. Limited access to clean water increases the risk of waterborne diseases, potentially leading to poor health outcomes and reduced school attendance. Inadequate healthcare facilities mean that illnesses are often untreated, make absenteeism worse and lower productivity. The absence of scholarships restricts educational advancement, causing economic hardship and the reliance on child labor. Furthermore, the lack of dedicated community initiatives to combat child labor leaves children vulnerable to exploitation, despite some level of awareness. Improving the availability and quality of these amenities is critical to enhancing the well-being of children and their communities. Investments in infrastructure, education, and health programs are essential for breaking the cycle of poverty and promoting sustainable development. These findings are consistent with studies that highlight the role of social infrastructure in mitigating child labor and promoting community development (ILO, 2020; UNICEF, 2023). The lack of separate restrooms particularly affects girls' school attendance and hygiene, while the absence of school feeding programs makes absenteeism worse and reduces the time children spend on education. Limited access to scholarships further restricts opportunities for higher education, perpetuating poverty and child labor. Although most schools do not practice corporal punishment, its presence in a few community schools shows the need for broader awareness and adoption of child-friendly disciplinary methods.

These deficiencies highlight the vulnerability of these communities to socioeconomic shocks and their limited capacity to support child protection. Addressing these deficiencies requires a holistic approach that includes investment in school infrastructure, the introduction of feeding programs, and expanded access to scholarships. Such interventions can enhance attendance rates, support children's well-being, and reduce their vulnerability to child labor, fostering a more protective environment within cocoa-producing communities.

A moderate PCI score of 57.6% indicated both progress and gaps in child protection within these communities. That is there are moderate protective measures, but significant improvements are needed. Investments in education, child welfare, and infrastructure are crucial to strengthening community resilience and reducing child labor. Expanding access to scholarships and feeding programs, improving healthcare, and implementing targeted interventions can create a more protective environment for children in cocoa-producing communities.

The lack of correlation highlights the possibility that other underlying factors, such as poverty, cultural norms, and economic dependency, play a more dominant role in driving child labor. These findings align with existing literature, which emphasizes that while community initiatives are valuable, they often fail to address deeper structural issues such as income inequality and inadequate access to education. This suggests that community-level protective measures, such as awareness campaigns or local initiatives designed to reduce child labor, may not directly influence the degree of children's participation in cocoa farming. Effective interventions should extend beyond community-level protective measures to include comprehensive strategies targeting economic reforms, educational support, and stronger enforcement of child labor policies. Such an integrated approach can help mitigate the socioeconomic and cultural factors contributing to child labor in cocoa-producing communities. Thus, enhancing social amenities, promoting gender equality, and supporting educational initiatives are essential for creating a more protective environment for children.

Determination of the chemical composition of essential oil obtained from Cymbopogon citratus (DC.) Stapf leaves grown in Turkiye

Serpil Demirci Kayiran[1], Saliha Kırıcı[2], Elif Ferahoglu[2]

[1]Faculty of Pharmacy, Department of Pharmaceutical Botany, Cukurova University, 01330, Adana, Turkiye
[2]Department of Field Crops, Faculty of Agriculture, Cukurova University, Adana, Türkiye

Abstract

Cymbopogon citratus (DC.) Stapf is an aromatic plant in the Poaceae family, known as lemongrass. *C. citratus* is widely grows naturally in India, Africa, South America, Indonesia, countries. It is used to make cosmetics and perfumes in the pharmaceutical industries, and as a culinary flavouring in the food industry. Leaves, aerial, roots of *C. citratus* has been used as cosmetics and perfumes, antipyretic, analgesic, spasmodic, diuretic, calming in Traditional Chinese Medicine. Essential oils of *C. citratus* comprises many chemical constituents such as citral mycrene, genariol, citronellol (cymbopogonol and cymbopogone) and α-oxobisabolene. It consist a significant group of essential oil, phenolic compounds, flavonoids, and other phytochemicals that have pharmacological activities such as antibacterial, antifungal, anticancer, antioxidant, antinociceptive, antiobesity, antidiarrhoeal and anti-inflammatory properties that can improve health. In this study, the chemical composition of the essential oil obtained from the leaves of *C. citratus* was analyzed by GC-MS. The essential oil analysis of *C. citratus* revealed a composition dominated by four major compounds: Geraniol acetate, Citral, β-Citral, and geranial.

Key Words: Cymbopogon citratus, essential oil, GC MS

Türkiye'de yetiştirilen Cymbopogon citratus (DC.) Stapf yapraklarından elde edilen uçucu yağın GC MS ile kimyasal bileşiminin belirlenmesi

Özet

Cymbopogon citratus (DC.) Stapf, limon otu olarak bilinen Poaceae familyasından aromatik bir bitkidir. *C. citratus* yaygın olarak Hindistan, Afrika, Güney Amerika, Endonezya, ülkelerinde doğal olarak yetişir. İlaç endüstrisinde kozmetik ve parfüm yapımında, gıda endüstrisinde ise mutfak aroması olarak kullanılır. *C. citratus*'un yaprakları, havası, kökleri kozmetik ve parfüm olarak, Geleneksel Çin Tıbbında ateş düşürücü, analjezik, spazmodik, idrar söktürücü, sakinleştirici olarak kullanılmıştır. *C. citratus* uçucu yağları sitral mikren, genariol, sitronellol (cymbopogonol ve cymbopogone) ve α-oksobisabolen gibi birçok kimyasal bileşen içerir. Sağlığı iyileştirebilen antibakteriyel, antifungal, antikanser, antioksidan, antinosiseptif, antiobezite, antidiyareik ve antiinflamatuar özellikler gibi farmakolojik aktivitelere sahip önemli bir uçucu yağ, fenolik bileşikler, flavonoidler ve diğer fitokimyasallar grubundan oluşur. Bu çalışmada, *C. citratus*'un yapraklarından elde edilen uçucu yağın kimyasal bileşimi GC-MS ile analiz edilmiştir. *C. citratus*'un uçucu yağ analizi, dört ana bileşiğin hakim olduğu bir kompozisyon ortaya koymuştur: Geraniol asetat, Sitral, β-Sitral ve geranial.

Anahtar Kelimeler: Cymbopogon citratus, uçucu yağ, GC MS

Perceived Impact Of Tea Farming On Livelihoods Of Smallholder Farmers In Panchagarh District

Abdullahi Ali Ibrahim[1], Md. Sadekur Rahman[2] Md. Rubayet Al Ferdous Noman[3]

[1]Former Master's Student, Department of Agricultural Extension, Hajee Mohammad Danesh Science and Technology University, Dinajpur-5200, Bangladesh
[2] Professor, Department of Agricultural Extension, Hajee Mohammad Danesh Science and Technology University, Dinajpur-5200, Bangladesh
[3] Assistant Professor, Department of Agricultural Extension, Hajee Mohammad Danesh Science and Technology University, Dinajpur-5200, Bangladesh

Abstract

The main objective of the study was to assess the perceived impact of tea farming on livelihoods of the smallholder tea growers. The research was conducted in the Tetulia upazila under Panchagarh district. A total of 550 farmers constituted the population of the study, and 118 small tea growers were selected as samples of the study following simple random sampling techniques. An interview schedule was used for data collection, and data was collected from 28 August to 12 October 2023. Perceived impact on livelihood of the small tea growers were assessed based on a five-point Likert scale. In contrast, both Pearson's product-moment correlation coefficient (r) and multiple linear regressions were performed to determine the relationships, influence and contribution of the selected characteristics to perceived impact of tea farming on livelihood of smallholder farmers. Present status explored that bought leaf factories are the major buyer of leaves and small-scale farmers were not getting the desired price of their tea leaves. The price fluctuation has happened over time in recent years and 20 to 40 percent deduction of the weight by the factories due to the long and large leaves. More than four-fifths of the tea growers cut raw leaves with a sharp knife instead of plucking leaves by hand. Most tea growers use pickup trucks to transport an excessive amount of raw leaves due to the high cost of labor and transportation which also degrades the quality of the tea. So, a significant proportion of the small tea growers who rely solely on income from tea farming opined that it is not profitable. Therefore, an overwhelming majority of tea growers are moderately satisfied by cultivating tea. Farmers have lost interest in cultivating tea due to the determining the price of raw leaves as desired by the factory owners and giving deductions on the leaves supplied by farmers and non-availability of low-cost agricultural credit and subsidized fertilizers and pesticides among small tea farmers. The bought leaf factories owners opined that unplanned tea farming by small growers supplied low quality and irregular raw leaves, impeding the production of good quality tea and causing a decline in tea auction market prices. The results of the study showed that tea farming had a medium perceived impact on livelihood of the 67.8 percent farmers. The selected characteristics of the farmers such as education status, farm size, tea cultivating area, income from tea farming, innovativeness, knowledge on tea farming, and attitude towards selling price of tea leaves have significant and positive effect on perceived impact of tea farming on livelihood of the small holder tea growers. Multiple regression analysis revealed that the whole model explained 63.9 percent of the total variation in the perceived impact of tea farming on livelihood of the small holder tea growers. Education status, innovativeness, knowledge on tea farming, and attitude towards selling price of tea leaves showed significant positive contributions to the perceived impact of tea farming.

Key Words: *Livelihood, Smallholder tea growers, Percieved impact, Tea farmers, Panchagarh district*

Introduction

The evergreen Camellia sinensis plant, a member of the Theaceae family, yields the leaves used to create the beloved beverage, tea (Arancon et al., 2007). Tea, the world's second most consumed beverage after water which is produced by the infusion of Camellia sinensis leaves. The world's total tea production is reported to increase from 2.9 million tons in 1994 to 6.1 million metric tons in 2019 (Ismail et al., 2020). The annual consumption of tea is assessed to be almost 273 billion liters and is anticipated to rise to 297 billion liters by 2021 (Ismail et al. 2020). Globally tea is one of the economic factors for many countries due to its large-scale plantation, production, marketing, and consumption (Hajiboland, 2017). It is the third commodity after petroleum and edible oil on which our billions of expenditures have been spent annually. It is a labor-intensive crop and produces employment and income generating possibilities and indirectly participates in economic development (Rehman et al., 2012). The main tea producing countries are China, India, Kenya, Sri Lanka, Vietnam, Argentina, and Turkey. In Bangladesh, tea stands as a significant cash crop and exportable commodity. The country's tea legacy dates back to 1840, with

the establishment of the first tea garden in Chittagong. Presently, tea cultivation flourishes in three ecologically diverse regions: the Surma valley in greater Sylhet, the Halda valley in Chittagong, and the Karatoa valley in Panchagarh. Bangladesh boasts 162 tea estates, spanning roughly 60,179 hectares of tea plantation, producing about 67.38 million kilograms of finished tea annually, with an average yield of approximately 1270 kilograms per hectare. Impressively, the tea industry contributes 0.11 percent to the nation's GDP (Raliman et al. 2020; Ahmad and Hossain 2013).

The Bangladesh Tea Research Institute (BTRI) has played a pivotal role in this success, introducing high-yield and quality clones along with hybrid seed stocks of biclonal and polyclonal origin (Alam, 2002). Various improvements, from revised fertilizer policies for mature and immature tea to optimized integrated pest control methods, have further enhanced tea production. The COVID-19 pandemic has not deterred the growth of tea production, particularly in Panchagarh and northern districts. The favorable climate and soil conditions in Panchagarh spurred its transformation into a key tea cultivation area in the late 1990s, with a significant increase in production. In 2020, Panchagarh alone produced over 10.30 million kilograms of tea, worth Tk 175 crore, marking a 7.11 lakh kg increase from the previous year (Daily Star, 2021).

This growth has not only met domestic demand but also expanded to international markets. The economic transformation has driven many farmers to switch from traditional crops to tea cultivation, fostering the emergence of 6,523 tea producers on 8,642 acres of land. Panchagarh is now home to 1,007 registered tea farmers and 10 large-scale tea estates, solidifying its status as a thriving tea cultivation hub (Dhaka Tribune 2021; Business Post 2022). Recently, primary producers have taken a significant financial hit as a result of the drop in price of raw tea leaf in the Tetulia Upazila of Panchagarh. However, tea farmers are not obtaining a fair price while the season is in progress. Despite the fact that there are vast gardens full of tea leaf, the price is quite low. Tea farmers are losing money because they are not receiving a fair price for their product. The owners of locally produced tea manufacturers were said to be members of a syndicate that was operating behind the tea price drop, according to allegations made by marginal producers. Over the course of the past few years, growers have been responding to market pressure to drive up tea leaf prices. In addition to that, they repeatedly formed chains of people. However, it failed to arouse any feeling of authority. Suddenly, the proprietors of tea factories have begun repressing their employees in the same manner as the Neelkars. The price of a kilogram of tea leaves has dropped to 11 taka. However, factories often subtract between 15 and 20 percent. This amount does not even come close to covering pay, much alone the cost of pesticides. The cost of producing one kilogram of tea leaves is around fourteen taka that is why farmers have to account for waste (Daily Star, 2022). It is of utmost need to research the linkages between socio-economic condition of smallholder tea growers, their tea farming status, and their livelihood condition. However, the purpose of this study is to provide answers of the following research questions:

i. What are the selected characteristics of the smallholder tea farmers?
ii. Is there any impact of tea farming on improving the livelihood status of smallholder farmers?
iii. What are the influences of farmers' selected characteristics on the perceived impact of tea farming on livelihood of smallholder farmers?

The promotion of tea cultivation as a nonconventional kind of agriculture is giving farmers rich returns in addition to offering enormous work opportunities, which is elevating the quality of life for thousands of people in five northern districts. Tea planting on plain lands is quickly developing in the "Kartoa Valley" ecological zone, which consists of five northern districts, according to the data of the Bangladesh Tea Board (BTB) at its Panchagarh Regional Office. This is transforming the rural economy. "Over 30,000 individuals, the most of whom are women are leading better lives in the Panchagarh, Thakurgaon, Dinajpur, Nilphamari, and Lalmonirhat districts of the valley." he stated. "These people are receiving higher salaries from farm-activities and picking tea leaves." The "Karton Valley" had an all-time record output of 14.54 million as of processed tea in 2021 as a consequence of increased tea growing This was an increase of 424 million kgs over the previous year's production of 10.30 million kgs of processed tea in the year 2020. According to Bangladesh Tea Board (BTB) authority, "Owners of nine registered and 21 unregistered tea estates and 8.067 smallholders planted tea on 11.434 acres of land in 2021." which is an increase of 1,264 acres compared to the 10.170 acres of land used for tea cultivation in 2020. When compared to the production of 51.28 million kgs of green tea leaves in the valley in 2020, the mountain region's output of green tea leaves increased to 73.57 million kgs in 2021 as a result of successful tea cultivation (Dhaka Tribune, 2021). Twenty-two businesses located in Panchagarh. Thakurgaon, and Lalmonirhat were responsible for the processing of 73.57 million kilograms (kg) of green tea leaves, which resulted in the production of 14.54 million kilograms (kg) of processed tea. This amount represented 15 percent of the total national production of 96.506 million kilograms (kg) in 2021 (Business Post, 2022).

The present study addresses the following specific objectives to:

i. determine and describe the selected characteristics of the smallholder tea growers;
ii. assess the perceived impact of tea farming on livelihoods of the smallholder tea growers; and
iii. explore the influence of the selected characteristics of the tea farmers on the perceived impact of tea farming on livelihood of smallholder farmers.

Materials and Methods

Study area

The study was conducted in northern Bangladesh, especially Tetulia Upazila under Panchagarh district of Bangladesh. Tetulia has an area of 189.12 square kilometers and is located between latitudes 26°24' and 26°38' north and longitudes between 88°21' and 88°33' east. This upazila is bounded on the north, south, and west by West Bengal, India, and on the east by Panchagarh Sadar upazila.

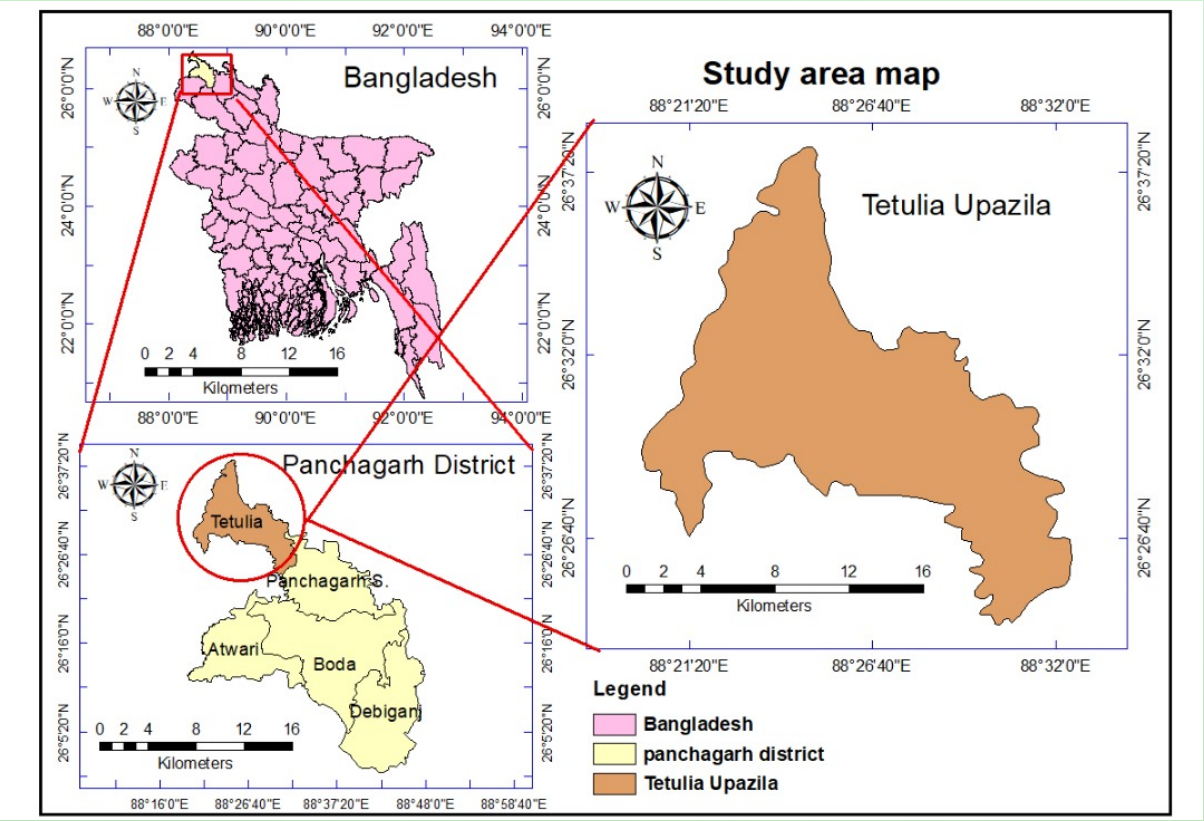

Figure 1. Map of Bangladesh and Panchagarh district showing the study area

Population and Sample

A total 550 small tea growers list was collected from Bangladesh Tea Board (BTB) Panchagarh Office, which constituted the population of this study. To make a respected sample from the population the following formula was used as developed by Kothari (2004).

$$n = \frac{Z^2PQN}{(N-1)\,e^2 + Z^2PQ}$$

Where,
n= Sample size
Z=the value of the standard normal variable at the chosen (95%) confidence level (1.96)
P= Probability assume (0.5)
Q= Remaining from probability (1-P)
N= Total population
e= the level of precision (8%)
By using this formula, 118 smallholder tea growers were selected as a sample of the study by following random sampling technique from the study area. Beside this, a reserved list of 20 farmers was prepared who were supposed to be interviewed only when a respondent in the original sample list was unavailable during data collection.

Research instrument and data collection

In order to collect valid and reliable information an interview schedule was prepared using both open and closed forms of questions to collect information. Simple, direct questions, statements and scales were included in the schedule to obtain information for independent and dependent variables. For Validity of the instrument pre-tested

with 20 respondents. Prior to completing the interview schedule, required adjustments and amendments were made based on the pre-test. The interviews were individually conducted at their respective residences and tea field of the respondents from 28 Aguest to 12 October 2023.

Variables of the Study

Measurement of independent variables

The independent variables of the study were focused on the smallholder tea farmers` socio-demographic profile of the smallholder tea growers and status of tea farming. The variables were as follows:

1. Age
2. Education status
3. Tea farming experience
4. Farm size
5. Recent tea cultivating area
6. Income from tea farming
7. Innovativeness
8. Extension contact
9. Knowledge on tea farming
10. Attitude towards selling price of tea leaves

Measurement of dependent variable

The dependent variable of this study was respondents` perceived the impact of tea farming on the livelihood of the smallholder tea growers. The variable was measured using a Likert scale (Likert 1932). The respondent was asked to express his/her opinion on 12 statements concerning tea farming, which were collected based on a review of the literature. The perceived impact of tea farming was measured by analyzing the perception index score. The ratings of the responses given by the respondents was measured following a 5-point Likert scale such as strongly agree, agree, no opinion, disagree, and strongly disagree, and the corresponding score of 5,4,3,2, and 1 was given for each of response, respectively. Thus, the Perceived impact of tea farming on livelihoods of Smallholder farmers could range from 0 to 60; while 0 indicating no Perceived impact of tea farming changed the livelihoods of Smallholder farmers and 60 indicating high perceived impact of tea farming the livelihoods of Smallholder farmers.

Data analysis

Different descriptive statistics like frequency, percentage, mean, standard deviation, and inferential statistics such as correlation, multiple linear regression, were employed. The Statistical Packages for the Social Sciences (SPSS) (version 25) was used to analyse the data. Results were presented in tables and graphs For clarity of understanding.

Results and Discussion

Characteristics profile of the smallholder tea farmers

The selected characteristics of smallholder tea growers included their age, education status, tea farming experience, farm size, tea cultivating area, income from tea farming, innovativeness, knowledge on tea farming and attitude towards selling price of tea leaves were presented in the Table 1. The age of the respondents ranged from 20 to 71 years, average being 39.79 years with a standard deviation of 11.61. Highest proportion (43.2 percent) of the respondents found in the young aged category compared to 33.1 percent middle and 23.7 percent old aged category. From the findings of the study young and middle aged tea growers constituted the major part. Because young age people are more amenable to new technologies such as cultivation of tea in the pain land, innovative, energetic, and risk taker than older on. Existing studies emphasizing the role of youth in agricultural transformation and are more likely to adopt agricultural innovations (Mahama et al., 2024, Harizanova-Bartos et al., 2019). The educational score of the tea farmers ranged from 0.5 to 18 with an average of 8.89 and standard deviation of 3.88. Results indicated that the highest proportion (45.8 percent) of the respondents had secondary level of education compared to 23.7 percent of them having higher secondary education, 9.3 percent of them having above secondary level education, 12.7 percent having primary level education and only 8.5 percent of the tea farmers could sign only. Thus, the majority (69.50 percent) of the tea farmers had education ranging from secondary to higher secondary level. The findings indicate the literacy rate of the tea growers is higher than the national average literacy of 55.7 percent (BBS, 2018). It can be assumed that the educational qualification of the tea growers may be higher than their neighbors'. Educated farmers are more likely to adopt modern farming techniques and management strategies (Worku, 2019). Higher education levels are also associated with an increased likelihood of embracing precision agriculture and sustainable farming practices (Hermans et al., 2021).

Additionally, research suggests that tertiary education contributes significantly to improving agricultural efficiency, as educated farmers are better equipped to comprehend and implement new agricultural technologies (Andrianarison et al., 2021). This supports the assumption that the educational qualification of tea growers provides them with the necessary skills for effective tea farming. Studies have also shown that farmers with access to formal education are more open to adopting innovations, which can lead to higher yields and better economic outcomes (Verma, 2024).

Table 1. Selected characteristics of the smallholder farmers (N=118)

	Scoring method	Range Observed (Possible)	Categories	Respondents No.	Respondents %	Mean	SD
Age	No. of years	20-71 (Unknown)	Young aged (<35) Middle aged (36-50) Old aged (>50)	51 39 28	43.2 33.1 23.7	39.79	11.61
Education status	Schooling year	0.5-18.0 (Unknown)	Can sign only (0.5) Primary (1-5) Secondary (6-10) Higher secondary (11-12) Above higher secondary (>12)	10 15 54 28 11	8.5 12.7 45.8 23.7 9.3	8.89	3.88
Tea farming experience	No. of years	2-14 (Unknown)	Less experienced (up to 6) Medium experienced (7-11) Highly experienced (≥12)	25 71 22	21.2 60.2 18.6	8.56	2.68
Farm size	Hectare	0.13-2.21 (Unknown)	Marginal (0.02-0.2 ha.) Small (0.2-1 ha.) Medium (1-3 ha.)	2 71 45	1.7 60.2 38.1	0.89	0.53
Tea cultivating area	Hectare	0.2-2.0 (Unknown)	Small (0.2-1 ha.) Medium (1-3 ha.)	71 47	60.2 39.8	0.90	0.50
Income from tea farming	('000'Tk.)	20-750 (Unknown)	Low income (up to 78) Medium income (79-471) High income (>471)	24 75 19	20.3 63.6 16.1	274.37	196.61
Innovativeness	Score	0-30 (Unknown)	Less innovative (up to 11) Moderately innovative (12-22) Highly innovative (>22)	77 32 9	65.3 27.1 7.6	9.06	6.62
Knowledge of tea farming	Score	6-19 (0 to 20)	Poor knowledge (up to 11) Fair knowledge (12-17) Good knowledge (>17)	13 90 15	11.0 76.3 12.7	14.31	3.11
Attitude of tea farmers towards selling price of tea leaves	Score	6-19 (0 to 20)	Poor knowledge (up to 11) Fair knowledge (12-17) Good knowledge (>17)	13 90 15	11.0 76.3 12.7	14.31	3.11

SD= Standard deviation

Thus, the findings from this study align with broader agricultural research, indicating that a higher education level significantly influences farmers' ability to adopt advanced techniques and improve productivity (Baldock et al., 2022). Tea farmers with at least a secondary education level are well positioned to engage in team farming enterprises effectively and enhance their livelihoods. Tea farming experience of the respondents ranged from 2 to 14 years. The mean tea farming experience is 8.56 years with a standard deviation of 2.68 years. Analyzed data demonstrated in Table 1 indicate that the majority (60.2 percent) of tea farmers had medium experienced of tea farming while 21.2 percent had jointly less experienced and only 18.6 percent highly experienced of tea farming. It means that the majority (78.8%) of the tea farmers had farming experience of medium to high experience of tea farming. The farm size of the respondents in the study area ranged from 0.13 to 2.21 hectares. The mean of farm size was 0.89 hectares with a standard deviation of 0.53 hectares. Results showed that majority of the respondents (60.2 percent) had small farms while 38.1 percent had medium farm size, and only 1.7 percent was marginal. The findings revealed that almost all (98.3 percent) of the respondents had small to medium farm size. In the context of the study area the respondents had farm sizes of up to 3 hectares, which is not so much less than we think. However, there are no landless respondents found in the study area. Studies indicate that larger farm sizes are associated with higher yields and greater economic returns due to economies of scale (Gessesse & He, 2021). However, smallholder farmers can still achieve high productivity through efficient land use, modern agronomic practices, and cooperative farming models (Ateka et al., 2018).

Additionally, research suggests that farm size influences household poverty levels, with small farms often yielding lower incomes, thus necessitating supplementary income sources (Rotich et al., 2017). In Kenya, smallholder tea farmers with diversified crop production reported higher profitability compared to those solely dependent on tea farming (Kanyua et al., 2015). Furthermore, land tenure security and access to land certification have been identified as critical factors in improving farm productivity. Secure land tenure allows farmers to make long-term investments in their tea farms, thereby enhancing production efficiency (Gessesse & He, 2021). Policies that support smallholder land consolidation, credit access, and technical training can significantly contribute to the economic viability of tea farming (Munishi et al., 2017). Overall, the study's findings align with existing literature emphasizing the importance of efficient land management, innovative farming techniques, and supportive policies to enhance smallholder tea farming sustainability. The range of recent tea cultivation areas from 0.2 to 2.0 hectares, mean was 0.90 hectares and standard deviation of 0.50. majority of the respondents (60.2 percent) had small recent

tea cultivated areas and 39.8 percent had medium recent tea cultivated areas. It means that a significant portion of tea growers may face lower incomes and potentially reduced livelihood stability due to limited land for cultivation, while 39.8 percent with medium sized areas may have a comparatively more secure economic base. Research shows that increasing farm size can significantly enhance tea yield and economic stability (Gessesse & He, 2021). Farmers with smaller tea farms may benefit from land consolidation and cooperative farming models to improve efficiency and profitability (Munishi et al., 2017). Additionally, the adoption of organic tea cultivation has been shown to improve the economic viability of smallholder farmers by increasing market value and reducing input costs (Doanh et al., 2018). Supporting smallholder farmers with better market access, extension services, and sustainable farming methods can enhance productivity and long-term economic sustainability (Ateka et al., 2018). Income from tea farming is the total annual money generated from cultivating and selling tea leaves. Income of the respondents from tea farming ranged from Tk. 20,000 to Tk.750, 000 with the mean of Tk. 274,370 and standard deviation Tk. 196,610. Findings showns that 63.6 percent of the respondents belonged to the medium of income followed by 16.1 percent in high and 20.3 percent in low income group from tea farming. Thus, the overwhelming majority (83.9 percent) of tea farmers had low to medium income from tea farming. This suggests that the livelihoods of many tea growers are moderately impacted by their income from tea farming, which might not provide a high standard of living or economic security. Income disparities among tea farmers are influenced by farm size, farming practices, and access to markets. Studies indicate that farmers with diversified cash crop production tend to earn more than those who rely solely on tea farming (Kanyua et al., 2015). Additionally, research suggests that contract farming and sustainability certification can enhance income by providing stable prices and premium market opportunities (Nguyen, 2020). In Tanzania, studies have shown that smallholder tea farmers with access to credit, extension services, and cooperative structures experience improved income stability (Dogeje & Ngaruko, 2023). Furthermore, improving infrastructure and market linkages can significantly boost smallholder tea farmers' earnings and reduce poverty levels (Rotich et al., 2017). Overall, these findings suggest that while tea farming provides a primary source of income for smallholder farmers, additional support in the form of cooperative farming, credit access, and sustainable practices is necessary to enhance economic security and long term viability.

The innovativeness scores of the respondents ranged from 0 to 30 with average of 9.06 and standard deviation were 6.62. The computed data indicated that 65.3 percent of the respondents had less innovativeness compared with 27.1 percent had moderately, and only 7.6 percent had highly innovativeness. The findings of the study revealed that more than half (65.3 percent) of the respondents had less innovativeness on modern agricultural technology. This means that the majority of the tea farmers had less innovativeness towards the improved farming practices in terms of duration of practicing improved farming on tea production. Knowledge on tea farming of the tea farmers ranged from 6 to 19 against the possible range of 0 to 20. The mean and standard deviation were 14.31 and 3.11 respectively. It can be clearly seen from the findings that an overwhelming majority (76.3 percent) of the respondents possessed fair knowledge on tea production, followed by 11.0 percent with less and 12.7 percent having good level of knowledge of tea farming. Thus, we can conclude that 87.3 percent of the tea farmers had low to fair knowledge on tea farming and highlighting the potential need for educational and training programs in tea farming. When it comes to selling price of tea leaves, attitude defines how they approach the challenges and opportunities associated with the fluctuating prices of their tea leaves. Considering the drop of raw leaf, the attitude of the respondents was measured. Attitude scores of the respondents towards selling price of tea leaves could theoretically range from 0 to 100. However, their observed scores ranged from 30 to 81 with an average of 50.65, and standard deviation of 7.64. It was found that among the respondents' 50.0 percent belong to moderately favorable attitude category while 24.6 percent had moderately favorable attitude, 15.3 percent had highly favorable attitude, 8.5 percent had highly unfavorable attitude and only 1.7 percent had neutral attitude towards selling price of tea leaves. These findings suggest that most farmers are neither strongly optimistic nor completely dissatisfied with tea leaf prices but maintain a cautiously optimistic stance. Several factors contribute to this moderate satisfaction level. The fluctuation in raw tea leaf prices at different bought-leaf factories, potential collusion between buyers and sellers, and increasing costs of tea cultivation may all influence farmers' attitudes. Research has shown that tea smallholders often perceive pricing structures as unfair due to external control by factory owners and market intermediaries (Kakoty, 2021). Additionally, studies in Kenya have demonstrated that price volatility in the tea sector creates uncertainty for smallholder farmers, impacting their willingness to expand production and invest in quality improvement measures (Kiplimo et al., 2015). Moreover, tea pricing decisions are influenced by factors beyond the farmers' control, including agro-climatic conditions, plucking standards, and the cost of inputs (Kanyua et al., 2015). In the case of Bangladesh, farmers in Panchagarh have expressed disillusionment due to not receiving the expected fair prices for their tea leaves. The initial phase of tea farming was characterized by fewer cultivars and higher pricing, but as the number of tea farmers increased, the market became more competitive, leading to lower prices and reduced profit margins. This aligns with global trends, where increased supply often drives prices down, especially in commodity markets dominated by large processing units (Mahindapala, 2020).

To improve pricing satisfaction among tea smallholders, researchers suggest the adoption of collective marketing strategies, participation in cooperatives, and the establishment of price stabilization mechanisms (Trimo et al., 2018). Moreover, branding and certification of specialty tea can enhance the market value of tea leaves, enabling farmers to receive premium prices (Raj, 2021).

Extension contact

Extension contacts measure the level of interaction between tea farmers and tea extension workers, and it is a very effective and powerful source of receiving information about various new and modem technologies.

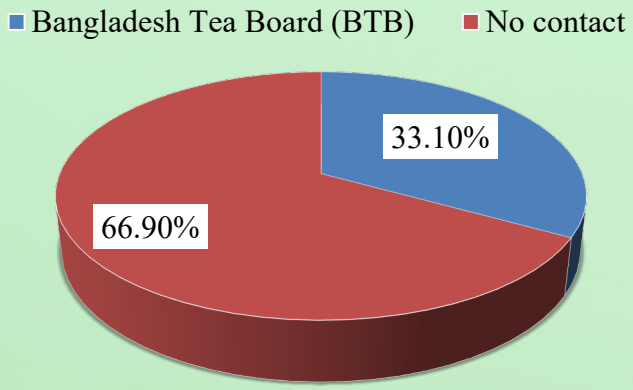

Figure 2. Distribution of the smallholder tea growers based on their extension contact

Graphical data in Figure 2 indicated that Majority (66.9 percent) of the tea farmers have no contact with extension compared to 33.1 percent of them having Bangladesh tea board (BTB) extension contact. It may be remarked that many tea farmers lack access to extension services, but those who access to extension contact like Bangladesh Tea Board (BTB) gain valuable insights into new agricultural technologies. This information can enhance their tea cultivation, leading to higher crop yields which can influence their livelihoods. Furthermore, studies in Sri Lanka have highlighted the importance of public-private partnership (PPP) extension models in bridging the gap between government-led and private-sector advisory services. These models have been shown to improve trust, technical knowledge sharing, and farmer participation in sustainable tea production (Amarathunga & Jayasinghe, 2024). Similarly, research on extension services in Indonesia has found that smallholder farmers who engage with agricultural extension programs tend to adopt better farm management strategies, leading to increased efficiency and income (Kosim et al., 2021).

Despite these benefits, challenges remain in ensuring widespread access to extension services. Research suggests that privatized extension models often face governance and accountability issues, which can limit their effectiveness for smallholder tea farmers (Mbeche et al., 2021). Thus, policymakers and agricultural agencies should focus on expanding extension outreach, improving farmer education programs, and integrating technology based advisory services to ensure that all smallholder tea growers can access essential agricultural information.

Perceived Impact of Tea Farming on Livelihoods of Smallholder Tea Growers

The perceived impact of tea farming on livelihoods of Smallholder tea growers was determined was assessed in three ways:

a) By assessing the overall perceived impact of tea farming on livelihood of smallholder tea growers, (b) by assessing dimension wise perceived impact of tea farming on livelihood of small tea growers, (c) by assessing the statement-wise perceived impact of tea farming.

The results are as follows:

Overall perceived impact of tea farming on livelihoods of smallholder tea growers

The observed overall perceived impact of tea farming scores ranged from 31 to 49 against the possible range of 12 to 60 with a mean of 39.75 and standard deviation of 4.62. Based on Their 'Perceived impact of tea' scores the respondents were classified into three categories such as 'Low perceived impact' (up to 35), 'Medium perceived impact' (36-45), and 'High perceived impact' (above 45) as shown in Table 2.

Table 2. Distribution of the smallholder tea growers based on their perceived impact on livelihood

Range		Categories (in score)	Frequency	Percent	Mean	SD
Possible	Observed					
12-60	31-49	Low perceived impact (up to 35)	24	20.3	39.75	4.62
		Medium perceived impact (36-45)	80	67.8		
		High perceived impact (above 45)	14	11.9		
		Total	118	100.0		

The results of Table 2 show that highest proportion (67.8 percent) of respondents believed that tea farming had a medium perceived impact on their livelihoods. A smaller proportion (20.3 percent) perceived a low perceived impact and while only 11.9 percent perceived a high perceived impact of Tea farming. This indicates that a very large majority (88.1 percent) of the respondents fell within the low to medium perceived impact category, suggesting that the overall perceived impact of tea farming on their livelihoods was not very high.

Dimension wise perceived impact on livelihood of small tea growers

To measure the perceived impact of tea farming on livelihoods, five dimensions of livelihood were considered, as shown in Figure 3. The ranking of perceived impact of tea farming on livelihoods based on their Perceived Impact Indices (PIIs) was presented through a graphical representation in the form of a spider diagram representing the five dimensions.

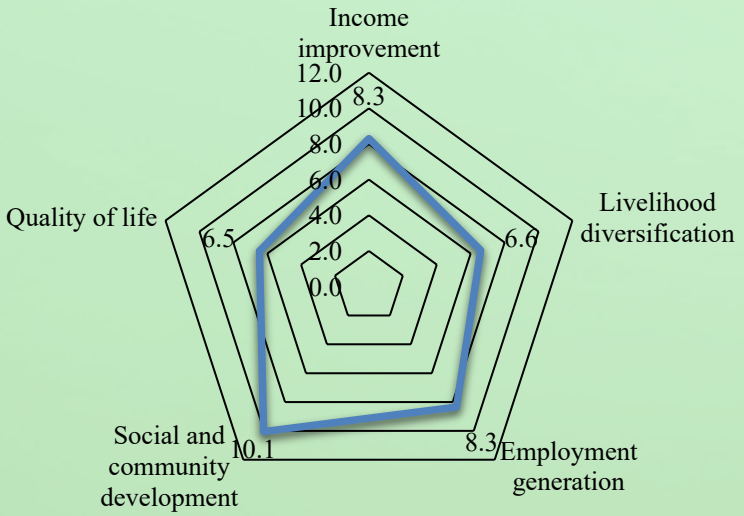

Figure 3. Dimension wise perceived impact on livelihood of small tea growers

Result of Figure 15 shows that among five dimensions of tea farmer's livelihood, Social and community development (PIIs=10.1) was mostly perceived impact by tea farming, followed by employment generation (PIIs=8.3) and income improvement (PIIs=8.3) were the second most. Livelihood diversification (PIIs=6.6) was the third and Quality life was the least perceived impact among all the five dimensions of tea farmer's livelihood.

Statement-wise perceived impact of tea farming

Twelve statements related to livelihoods of smallholder tea farmers were considered for measurement perceived impact of Tea farming. The ranking of the statements was done based on their Statement-wise Perceived Impact on Livelihood Index (PILI) and they are presented in Table 3. For having better understanding regarding perceived impact of Tea farming on livelihoods of Smallholder tea farmers, it was necessary to have an idea about the comparative statements in 12 selected statements. For this purpose, Statement-wise Perceived Impact on Livelihood Index (PILI) was computed.

The computed indices score of the 12 statements ranged from 288 to 521 against a possible range of 0 to 590. The rank order according to their Statement-wise Perceived Impact on Livelihood Index (PILI) is shown in Table 3.

Result in Table 11 indicate that 'tea farming has provided employment for local communities in the tea sector' (PILI=521) was the most perceived impact due to Tea farming. 'Tea farming has created job opportunities for me and other members of my household' (PILI=464) was found to have the second most perceived impact due to Tea farming. 'Tea farming has opened opportunities for additional livelihood activities' (PILI=424) emerged as the third most perceived impact due to Tea farming. 'Tea farming has significantly increased my household income' (PILI=288) was the least perceived impact due to Tea farming among the 12 selected statements.

Influencing variables to perceived impact of tea farming on livelihoods of smallholder farmers

Correlation Analysis

This section deals with the findings of the relationships between the selected characteristics of tea farmers and the perceived impact of tea farming on livelihood of smallholder farmers. The selected characteristics of the tea farmers are age, educational status, tea farming experience, farm size, tea cultivating area, income from tea farming, innovativeness, extension contact, knowledge on tea farming and attitude towards selling price of tea

leaves. The dependent variable was perceived impact of tea farming on livelihood of smallholder farmers. Pearson's Product Moment Correlation co-efficient (r) was used to determine the relationships between the selected characteristics of the farmers and the perceived impact of tea farming on the livelihood of smallholder farmers. At highest five percent (0.05) level of significance was used as the basis for rejection of a null hypothesis. The correlation analysis (Table 4) shows that eight out of ten variables are significantly positive related to the perceived impact of tea farming on the livelihood of smallholder farmers namely ,educational status, farm size, tea cultivating area, income from tea farming, innovativeness, extension contact, knowledge on tea farming and attitude towards selling price of tea leaves. In contrast, only age and tea farming experience had no significant relationship with the perceived impact of tea farming on the livelihood of smallholder farmers at five percent level of significance.

Table 3. Rank order of the livelihood options based on perceived impact on livelihood index value

Sl. No.	Statements	Level of agreement					*PILI	**RO
		SA	A	UD	DA	SDA		
(A) Income improvement:								
1.	Tea farming has significantly increased my household income	24	29	55	9	1	288	12th
2.	Tea farming has provided me with a stable source of income	1	24	65	28	0	356	9th
3.	Tea farming has helped me meet my financial needs and expenses	1	42	50	24	1	336	11th
(B) Livelihood diversification:								
4.	Tea farming has allowed me to diversify my income sources	18	20	30	44	6	354	10th
5.	Tea farming has opened up opportunities for additional livelihood activities	3	13	19	77	6	424	3rd
(C) Employment generation:								
6.	Tea farming has created job opportunities for me and other members of my household	0	16	5	68	29	464	2nd
7.	Tea farming has provided employment for local communities in the tea sector	0	0	8	53	57	521	1st
(D) Social and community development:								
8.	Tea farming has improved the social status and recognition of tea growers in the community	2	23	12	74	7	415	4th
9.	Tea farming has fostered a sense of community among tea growers	4	19	11	83	1	412	5th
10.	Tea farming has led to the development of social infrastructure and services in the area	15	23	24	54	2	359	8th
(E) Quality of life:								
11.	Tea farming has improved the living standards of small holder tea growers	4	38	26	45	5	363	7th
12.	Tea farming has provided better access to education, healthcare, and other essential services	9	22	31	49	7	377	6th

Multiple linear regression analysis

Multiple regression analysis (enter methods) was run to determine the influence of explanatory variables on Perceived impact of tea farming on livelihoods of smallholder farmers. Out of ten independent variables, eight were included in multiple regression analysis due to their significant values in correlation analysis (Table 4). The coefficient of determination (R2) indicates that all the independent variables explain 66.3 percent of the variance in the perceived impact of tea farming on smallholder farmers' livelihoods. The adjusted R2, calculated by only including the significant independent variables, reveals that 63.9 percent of the dependent variable's variation is attributable to these independent variables. Of them only four variables namely education status, innovativeness, knowledge on tea farming and attitude towards selling price of tea leaves had positive significant contribution to the perceived impact of tea farming on the livelihood of smallholder farmers. The contributions of the remaining selected characteristics were insignificant.

Table 5. Contribution of selected characteristics to the perceived impact of tea farming on the livelihood of smallholder farmers

Selected characteristics of the respondents	Unstandardized Coefficients		Standardized Coefficients	% Contribution	*t*-value
	β	SD	β		
(Constant)	23.410	1.966			11.906
Education status (X_2)	0.137	0.071	0.115		1.930*
Farm size (X_4)	0.106	0.697	0.012		0.152

In this connection however, the researcher rejected the null hypothesis concerned and concluded that each of the factors had a significant effect on the perceived impact of tea farming on smallholder farmers' livelihoods. In other words, the extent of perceived impact of tea farming on livelihood by the smallholder tea growers was influenced by those four factors. Innovativeness has the strongest positive impact, showing that farmers who adopt new techniques, value addition, and modern farming practices perceive greater benefits. This aligns with studies highlighting that innovative farmers achieve higher productivity and profitability (Nyokabi et al., 2024). Similarly, knowledge on tea farming is another major contributor, as better informed farmers can optimize their farming practices, leading to improved yields and income (Maina et al., 2012).

The attitude towards selling price of tea leaves also plays a crucial role, indicating that farmers who view tea prices favorably perceive more benefits from tea farming. This suggests that market confidence and price stability enhance farmer satisfaction and investment in tea production. Additionally, education status significantly impacts perception, as educated farmers tend to make informed decisions, adopt improved practices, and access better markets, leading to enhanced livelihood benefits.

Conclusions

Based on the major findings of the study and their logical interpretation the following conclusions were drawn:

- The selected characteristics of the smallholder tea growers reveals that majority of the respondents were young to middle aged having eleven years of experience with small tea cultivation area and very poor extension contact with Bangladesh tea board officials. The small growers have fair knowledge but due to not receiving any training they were unable to use their knowledge which leads them less innovative practices in tea farming.
- Tea farming had a medium perceived impact on the livelihood of the small tea growers which is mostly impacted in social and community development compared to other four dimensions of livelihood because tea is cultivated commercially in this area by other different tea state and small tea garden producers. Therefore, it might be concluded that though their livelihood was not expectedly impacted by tea farming but impacted in other considered dimensions of livelihood.
- Both the correlation and regression analyses showed that education status, innovativeness, knowledge on tea farming, and attitude towards the selling price of tea leaves had significantly influenced the perceived impact of tea farming on the livelihoods of smallholder farmers. These factors positively contribute to the economic stability and overall well-being of the tea farmers. Specifically, innovativeness showed the strongest positive

relationship (r = 0.701**), while education, knowledge, and attitude towards the selling price of tea leaves also have substantial positive impacts. Conversely, age and tea farming experience do not significantly affect the perceived impact. The results underscore the importance of fostering education, promoting innovative practices, enhancing knowledge dissemination, and empowering farmers in market negotiations to improve their livelihoods.

Recommendations

Based on the above conclusions and experience of the present study the following recommendations were made:

Recommendations for policy implications

- The findings of the study indicated that an overwhelming majority (82.5 percent) of the respondents have not received any training in tea farming. Therefore, Bangladesh Tea Board (BTB) may establish institutional tea training center for enhancing the tea farmers' competence and provide low-cost agricultural credit with subsidized fertilizers and pesticides among small tea farmers.
- Working along with both the Bangladesh Tea Board (BTB) and the Department of Agricultural Extension (DAE) to diagnose crops and tea fields and choose commercial tea-growing places for better quality tea instead of scattered cultivation in homestead area.
- The ministry of commerce needs to realize and take necessary measures for capacity building of Panchagarh BTB office for providing better services to the tea producers. The Ministry of commerce also may provide more rural inclusive financing and widening alternative use of tea leaves for tea growers.

Recommendations for further study

A piece of study cannot provide all information for proper understanding of the perceived impact of tea farming on the livelihood of smallholder farmers. It was felt that much investigation is needed for clear understanding of the perceived impact of tea farming on livelihood of smallholder farmers. Hence, the following suggestion might be helpful for further research:

- The study was conducted on perceived impact of tea farming on livelihood of smallholder farmers in Tetulia upazila under Panchagarah district of northern Bangladesh. The findings of this study should be verified by similar research in other parts of the country.
- This study investigated the relationship of ten selected characteristics of the tea farmers with the perceived impact of tea farming on the livelihood of smallholder farmers. Therefore, further research could be conducted to assess the relationships of other characteristics of the smallholder tea farmers with the same.
- Age and tea farming experience of the tea growers had no relationship with their perceived impact of tea farming on livelihood of smallholder farmers. As a result, further verification is necessary in this regard.

Acknowledgements

The authors would like to acknowledge Institute of Research and Training (IRT) for funding and support provided by department of agricultural extension, faculty of agriculture Hajee Mohammad Danesh Science and Technology University, Dinajpur-5200, Bangladesh. Special thanks are extended to the Bangladesh Tea Board (BTB) Regional Office, Panchagarh for kind cooperation.

Phytogenic Feed Additives: Their Role in Animal Nutrition

İlkay Yavaş[1], Hayrettin İlker Özdemir[1], Sıdıka Ekren[2]

[1] Aydın Adnan Menderes University, Koçarlı Vocational School, Department of Plant and Animal Production, Medicinal and Aromatic Plants Program, 09100, Türkiye
[2] Ege University, Faculty of Agriculture Department of Field Crops

Abstract

Phytogenic feed additives are used to improve feed quality, support growth and improve animal health. These additives have antimicrobial, antioxidant and gut-flora-regulating properties. Phytogenic compounds offer a safe and economical alternative as feed additives. The use of these feed additives, which are safe and of high nutritional quality, is very important for optimum animal performance. With the decrease in the use of antibiotics, phytogenic feed additives are becoming more preferred. Plants such as thyme, mint and basil improve growth performance and feed conversion in poultry. Turmeric has antioxidant and anti-inflammatory properties. The appropriate dosage of phytogenic feed additives is still unclear. Differences in the conditions under which plants grow in different regions make this difficult. However, these additives are considered to be safe and environmentally friendly alternatives. Plants such as cinnamon, thyme and cloves improve digestion by increasing the palatability of the feed. Essential oils have a positive effect on the activity of digestive enzymes. Phytogenic feed additives improve weight gain and feed conversion in chickens. Garlic, thyme and cornflower supplements also show positive effects. As a result, phytogenic feed additives are becoming increasingly popular in the feed industry as they improve animal performance, the immune system and feed palatability. As natural compounds of plant origin, these substances offer safe and healthy alternatives.

Key Words: *Anti-microbial properties, antioxidant effects, phytogenic feed additives, medicinal plants, essential oils*

Fitojenik Yem Katkı Maddeleri: Hayvan Beslenmesindeki Rolü

Özet

Fitojenik yem katkı maddeleri, yem kalitesini iyileştirmek, büyümeyi desteklemek ve hayvan sağlığını iyileştirmek amacıyla kullanılmaktadır. Bu katkı maddeleri, anti-mikrobiyal, antioksidan ve bağırsak florasını düzenleyici özellikleri ile dikkat çekmektedir. Fitojenik bileşikler, yem katkı maddesi olarak güvenli ve ekonomik bir alternatif sunmaktadır. Güvenli ve yüksek besin kalitesine sahip olan bu yemlerin kullanımı hayvanların optimum performansı için oldukça önemlidir. Antibiyotik kullanımının azalmasıyla birlikte fitojenik yem katkı maddeleri daha fazla tercih edilmektedir. Kekik, nane, fesleğen gibi bitkiler, kümes hayvanlarının büyüme performansını ve yem dönüşüm oranını artırmaktadır. Zerdeçalın antioksidan ve anti-inflamatuar özellikleri bulunmaktadır. Fitojenik yem katkı maddelerinin uygun dozu konusunda hala netlik yoktur. Farklı bölgelerde yetişen bitkilerin koşulları arasındaki farklılıklar bu durumu zorlaştırmaktadır. Ancak, bu katkı maddeleri güvenli ve ekolojik dost alternatifler olarak değerlendirilmektedir. Tarçın, kekik ve karanfil gibi bitkiler, yemin lezzetini artırarak sindirimi iyileştirmektedir. Uçucu yağlar ise sindirim enzimleri aktivitelerini olumlu yönde etkilemektedir. Fitojenik yem katkı maddeleri, tavukların ağırlık kazanımı ve yem dönüşüm oranını iyileştirmektedir. Sarımsak, kekik ve peygamber çiçeği takviyeleri de olumlu etkiler göstermektedir. Sonuç olarak, fitojenik yem katkı maddeleri, hayvan performansını, bağışıklık sistemini ve yem lezzetini iyileştirerek yem endüstrisinde giderek daha popüler hale gelmektedir. Bu maddeler, bitkisel kaynaklı doğal bileşikler olarak güvenli ve sağlıklı alternatifler sunmaktadır.

Anahtar Kelimeler: *Anti-mikrobiyal özellik, antioksidan etki, fitojenik yem katkı maddeleri, tıbbi bitki, uçucu yağlar*

Giriş

Ganguly (2013), fitojenik yem katkı maddelerinin genellikle yem özelliklerini iyileştirmek, bireysel üretim performansını teşvik etmek ve bu hayvanlardan elde edilen gıdanın kalitesini artırmak amacıyla kullanıldığını bildirmiştir. Fitojenik bileşikler, kümes hayvanlarının beslenmesinde antimikrobiyal, antioksidan ve bağırsak florasını düzenleyici etkiler göstermektedir (Gürbüz ve ark., 2019). Bu da tıbbi bitkilerin yem katkı maddesi olarak kabul edilebileceğini göstermektedir.

Güvenli ve yüksek besin kalitesine sahip yemlerin ve katkı maddelerinin kullanımı, hayvanların optimum performansı için oldukça önemlidir (Omenka ve Anyasor, 2010). Ancak, hayvan yemlerinde kullanılan bazı yem katkı maddelerinin üretiminde yeni teknolojilerin kullanımı, gıda güvenliği üzerinde oluşturduğu zorluklar nedeniyle sorgulanmaktadır. Günümüzde, birçok ülkede kümes hayvancılığı endüstrisinde antibiyotik kullanımı azalmaktadır. Bu azalmanın nedenleri arasında, tüketicilerin tercihi (Adedoyin ve ark., 2017), bazı sentetik yem katkı maddelerinin hayvancılık ve tüketici sağlığı üzerindeki zararlı etkileri ve ticari premikslerin (Adegbenro, 2015) ve antimikrobiyal büyüme hızlandırıcıların (AGP'ler) yüksek maliyetleri yer almaktadır. Bu nedenle, ekonomik olması ve uygun şekilde uygulandığında insanlarda kalıntı etkisi bırakmaması nedeniyle kümes hayvanı diyetlerinde fitojenik yem katkı maddelerinin kullanımı teşvik edilmektedir.

Rasyonlara % 0.1-0.5 düzeyinde kekik eklenmesinin, yumurta tavuklarında yem dönüşüm oranında bir iyileşmeye neden olduğu gözlenmiştir (Banerjee ve ark., 2013; Al-Kalabi ve Al-Kassie, 2013). Nane ve fesleğen yaprakları, öjenol, sitronellol, linalool, sitral, limonen ve terpineol gibi sağlık açısından faydalı uçucu yağlar içeren çok sayıda bitki kaynaklı kimyasal bileşik içermektedir (Gürbüz ve Salih, 2017). Sumak ve zencefilin broiler diyetlerinde kullanıldığında performansı olumlu yönde etkilediği ortaya çıkmıştır (Abdelaziz, 2015; Gürbüz ve Salih, 2017). Bir başka çalışmada, fitojenik yem katkı maddelerinin piliçlere verilmesinin büyüme performansını artırdığı vurgulanmıştır (Gürbüz ve ark., 2019). Tarçın, kekik, mercanköşk, kırmızı biber ve turunçgil özlerinin broiler rasyonlarına eklenmesi ile hayvanların vücut ağırlıkları artmıştır (Lippens ve ark., 2005). Benzer sonuçlar, Mountzouris ve ark. (2011) tarafından kekik, anason ve turunçgillerde piliçler üzerinde gözlenmiştir.

Fitojenik yem katkı maddelerinin faydalı etkilerine rağmen, kümes hayvanı üretiminde kullanılacak uygun doz netlik kazanmamıştır. Dünyanın farklı yerlerinde bulunan bitkilerin yetiştirme koşulları arasındaki farklılıklar, bitkilerin hasat dönemleri ve kümes hayvanı diyetlerine fitojenik yem katkı maddelerinin dahil edilme seviyelerinin standartlaştırılmaması zorluk oluşturmaktadır. Ancak, fitojenik yem katkı maddeleri, güvenli ve ekolojik olarak dost olmaları nedeniyle, antimikrobiyal büyüme destekleyicilerine göre daha iyi bir alternatif olarak değerlendirilebilmektedir (Oladeji ve ark., 2019).

Nanenin antioksidatif aktiviteleri, kekik ve mercanköşkteki fenolik terpenler ile yüksek oranda monoterpen, timol ve karvakrolün varlığından kaynaklanmaktadır (Rahim ve ark., 2011). Sarımsak ve soğanın içindeki kükürt bileşenleri, hem lipid oksidasyonunu azaltmış hem de kümes hayvanlarında düşük yoğunluklu lipoproteinlerin oksidasyonunu engellemiştir (Ahmed ve Bassuony, 2009).

Fitojenik yem katkı maddeleri, patojenlere karşı antimikrobiyal etkileriyle bilinmektedir. Ayachi ve ark. (2009), kekiğin içerdiği timol ve karvakrol bileşenleri nedeniyle Salmonella ve Candida albicans gibi mantarlara karşı etkili olduğunu vurgulamıştır.

Zerdeçalın, antioksidan ve antienflamatuar özelliklerinin yanı sıra antitümöral aktiviteleri de bulunmaktadır. Alloui ve ark. (2014) göre, %1 zerdeçal baharatı ile yem takviyesi, Eimeria maxima ile enfekte tavuklarda kilo alımını iyileştirmiş, bağırsak lezyonlarını ve oosit atılımını azaltmıştır.

Bazı fitojenik yem katkı maddeleri, kümes hayvanları için yemin tadını, lezzetini ve kabul edilebilirliğini iyileştirerek performanslarını artırmaya yardımcı olmaktadır. Tarçın özü, kekik ve karanfil, safra, mukus ve tükürük sindirim salgılarını uyarmakta ve enzim aktivitelerinin iyileştirilmesine yardımcı olmaktadır (Platel ve Srinivasan, 2004). Ayrıca, bitkilerden elde edilen bazı yağlar, tavuklarda tripsin ve amilaz aktivitelerini olumlu yönde etkileyerek ve bağırsak mukusunda uyarıcı etkiler yaratarak mikroplardaki dengeyi korumaktadır (Jamroz ve ark., 2006).

Fitojenik yem katkı maddeleri, tavukların ağırlık kazanımı ve yem dönüşüm oranı açısından kümes hayvanlarının üretim performanslarında önemli bir iyileşme sağlamaktadır. Trigonella foenum-graecum takviyesi, broiler tavukların yem dönüşüm oranını önemli ölçüde iyileştirmiş olup, bu durum gastrointestinal dokulardaki morfolojik değişikliklerle ilişkilendirilmiştir (Mamoun ve ark., 2014).

Sarımsağın, yumurta üretimini artırdığı, serum ve yumurta sarısının kolesterol içeriğini azalttığı ve yumurtacı tavuklarda bağışıklık tepkisini iyileştirdiği belirlenmiştir (Azeke ve Ekpo, 2009). Benzer şekilde, Adegbenro (2015) tarafından bildirildiği üzere, Moringa oleifera, Ocinum gratissimum, Manihot esculenta, Telfaria occidentalis ve Vernonia amygdalina yaprak ununun %5'e kadar kullanımı iştah açıcı olarak etki etmiş, sağlıklı yaşamı kolaylaştırmış ve tavuk üretimini, yumurta sarısı rengini ve lezzetini artırmıştır.

Yumurta tavuklarının diyetine %1.5-2 oranında Tanacetum balsamita eklenmesi, hem yumurta sarısı rengi hem de tavukların üretim performansı ve kan göstergeleri üzerinde olumlu etkiler sağlamıştır (Nobakht ve Moghaddam, 2013).

Fitojenik yem katkı maddeleri, etlik piliçlerde vücut ağırlığını, fagositik aktiviteyi ve antioksidan enzim seviyelerini önemli ölçüde artıran kekik ile yapılan diyet takviyelerinin, patojenlere karşı antimikrobiyal etkileri nedeniyle önemli olduğu ortaya konmuştur (Sadek ve ark., 2014). Fitojenik yem katkı maddeleri veya bitki özleri, daha güvenli ve sağlıklı olduklarına inanıldığı için yem endüstrisinde giderek popülerlik kazanmaktadır. Bu fitojenik katkı maddeleri, tıbbi bitkilerin, baharatların veya diğer bitkilerin yapraklarından, köklerinden, yumrularından veya meyvelerinden elde edilen heterojen bir yem katkı maddeleri grubu olarak karşımıza çıkmaktadır. Bütün, kurutulmuş ve öğütülmüş formda veya özüt ya da uçucu yağlar olarak mevcuttur. Bu yem

katkı maddelerinin özellikle domuz ve kümes hayvanlarında kullanımı son zamanlarda önem kazanmıştır (Jamroz ve ark., 2006).

Bir başka çalışmada ise, fesleğen, kekik ve adaçayı esansiyel yağlarının etlik piliç diyetlerindeki etkilerinin değerlendirildiği çalışmada, uyluk etindeki antioksidan kapasitesinin, toplam polifenol içeriğinin ve toplam n-3 ve n-6 çoklu doymamış yağ asitlerinin arttığı gözlenmiştir (Vlaicu ve ark., 2023).

Gıda güvenliği, çevre kirliliği ve genel sağlık riskleri hakkındaki artan endişeler nedeniyle, son yıllarda hayvan yemlerinde büyümeyi teşvik etmek amacıyla kullanılan antibiyotikler yasaklanmıştır. Sonuç olarak, hayvan bilimcileri ve üreticileri büyümeyi teşvik eden, et kalitesini iyileştiren ve hayvanların sağlığını artıran alternatifler aramışlardır. Bitki özleri, doğal olmalarının sağladığı faydalar nedeniyle günümüzde yem katkı maddesi olarak oldukça fazla ilgi görmektedir. Fitojenik yem katkı maddeleri arasında esansiyel yağlar, terpenoidler (mentol, linalool, geraniol, borneol, -terpineol) ve düşük molekül ağırlıklı alifatik hidrokarbonlar (timol, karvakrol, öjenol, sinnamaldehit) gibi düzinelerce bileşenden oluşan uçucu bileşiklerin karışımları, canlı organizmalar tarafından üretilmekte ve bir bitkinin tamamından veya bitkilerin belirli kısımlarından izole edilmektedir (Amiri, 2012). *Ocimum basilicum, Thymus vulgaris* ve *Salvia officinalis* gibi Lamiaceae veya Labiatae'den elde edilen esansiyel yağlar, tavukların diyetlerinde fitojenik yem katkı maddesi olarak yoğun bir şekilde kullanılmaktadır. Farklı esansiyel yağlar gerek tek başına gerekse broiler tavuk yemlerine eklenerek kullanıldıklarında üretim performanslarını (Smits ve ark., 1998; Jamroz ve ark., 2005) immünolojik durumu (Cook ve Samman, 1996; Bento ve ark., 2013), kan serumundaki ve kan lipit profilindeki enzimatik aktiviteyi (Guo ve ark., 2004; Abdulkarimi ve ark., 2011) ve bağırsak morfolojisini (Sadeghi ve ark., 2011, Azwanida ve ark., 2015) olumlu yönde etkilediği bildirilmiştir. Erkek broiler piliçlerde çeşitli kekik türlerinin *Thymus daenensis, T. kotschyanus, T. lancifolius* ve *T. transcaspicus*) hidroalkolik ekstraktlarının etkisi değerlendirilmiş ve *T. daenensis* verilen piliçlerin en iyi ağırlık kazanımına sahip olduğu gözlenmiştir. *T. daenensis* ekstraktı ilave edilen diyet, organik materyalin sindirilebilirliğini artırmış ve kuru madde, ham karbonhidrat, ham kül ve eter ekstraktı değerlerinde iyileşmeye neden olmuştur. Çalışma sonuçları broiler piliçlerin kekik ekstraktlarından etkilenmesinin civcivin yaşına ve bitkinin genotipine bağlı olduğunu ortaya koymuştur (Malekzadeh ve ark., 2018). Esansiyel yağların piliçlerde sindirim enzimlerinin salgılanmasını uyardığı (Dorman ve Deans, 2000; Al-Kassie, 2009), yağ (Smits ve ark., 1998) ve amino asit sindirilebilirliğini artırdığı gözlenmektedir (Jamroz ve ark., 2005). (Malekzadeh ve ark., 2018). Ayrıca flavonoid açısından zengin olan kekik bitkisinin kümes hayvanlarının bağışıklık ve savunma sistemi üzerinde düzenleyici etkisi gözlenmiştir (Cook ve Samman, 1996).

Fitojenik yem katkı maddeleri, geviş getiren hayvan performansını, rumen fermantasyonunu, süt üretimini, üreme sağlığını, kan profillerini, antioksidan ve antimikrobiyal özelliklerini, bağışıklığı ve et kalitesini iyileştirmektedir. Fitojenik yem katkı maddelerindeki esansiyel yağlar, polifenoller ve flavonoidler gibi belirli biyoaktif bileşikler önemli antimikrobiyal, antifungal, antioksidan ve antiparaziter özellikler göstermektedir Ayrıca ruminal fermantasyonu düzenlemekte, metan emisyonunu azaltmakta, yem alımını ve lezzetini artırmaktadır (Nastoh ve ark., 2024).

Tıbbi ve aromatik bitkiler, antik çağlardan beri yaşam koşullarını iyileştirerek toplumların gelişimine önemli ölçüde katkıda bulunmuştur. Fitojenik bileşimler, hayvan sağlığını ve büyümesini olumlu yönde etkileyen bitki kaynaklı biyoaktif maddelerdir. Bu maddeler tipik olarak uçucu yağlar ve bitkilerden elde edilen özler şeklinde kullanılmaktadır (Nastoh ve ark., 2024). Ayrıca bazılarının antioksidan, antimikrobiyal, antifungal ve antiviral özelliklere sahip olduğu düşünülmektedir (Yang ve ark., 2015). Fitojenik, fitobiyotik ve fitokimyasallar, performansı ve karlılığı artırmak için hayvancılık diyetlerine eklenen, bitki kaynaklı doğal biyoaktif bileşiklerdir (Lillehoj ve ark., 2018). Bu bileşikler anason, karanfil, kekik veya melisa gibi baharatlardan, bitkilerden ve uçucu yağlardan elde edilmektedir (Steiner ve Syed, 2015).

Hayvan yemlerinde çoğunlukla Lamiaceae, Apiaceae, Rosaceae, Asteraceae; diğer yaygın bitki familyaları arasında Alliaceae, Brassicaceae, Cannabaceae, Fabaceae, Gentianaceae, Lauraceae, Myrtaceae, Papaveraceae, Rosaceae, Solanaceae, Zingiberaceae ve sınırlı dağılıma sahip bazı türler bulunmaktadır (Franz ve ark., 2020). Tıbbi ve aromatik bitkiler ve özleri, geviş getiren hayvanların üretimini ve yem kullanımını artırmak için yenilikçi yöntemler sunarken, süt ve et gibi ürünlerinin kalitesini rumen sindirimine etkide bulunarak iyileştirmektedir (Skoufos ve ark., 2020). Fitojenik bileşikler, özellikle uçucu yağlar ile birleştirildiğinde, artan lezzet ve aroma ile lezzetliliği iyileştirerek yem alımını potansiyel olarak artırabilir.

Yenidoğan Holstein buzağılarının mayasına prebiyotik (kobalt laktat ve arabinogalaktonlar) ve uçucu yağ (karvakrol, karyofilen, p-simet, sineol, terpinen ve timol) eklenmesi, yem dönüşüm oranında, kuru madde alımında ve ortalama günlük kazanımda doğrusal bir artışla birlikte vücut çerçeve ölçümlerinde artışa neden olmuştur (Liu ve ark., 2020). Benzer sonuçlar, sıcaklık stresi altındaki kuzulara %1-2 oranında tarçın, zerdeçal, biberiye ve karanfil tomurcuğu karışımının uygulanması yem dönüşüm oranında, kuru madde alımında ve vücut ağırlığında iyileşmeye yol açmıştır (Hashemzadeh ve ark., 2022).

Koyunların diyetlerine 300 mg/kg kekik uçucu yağı eklendiğinde koyunların büyüme performansı, bağırsak florasının yapısı ve bileşiminin iyileştiği gözlenmiştir (Sun ve ark., 2022).

Kekik, biberiye, kekik, kişniş, sarımsak, okaliptüs, anason, karanfil, nane, tarçın, zerdeçal gibi yaygın olarak kullanılan bitkiler, özellikle antioksidan ve büyüme destekleyicileri olarak tatmin edici sonuçlar göstermiştir.

Ayrıca dut, nar ve üzüm çekirdeği gibi meyve özlerinin performansı, sindirilebilirliği, süt üretimini, bağışıklığı ve antioksidan durumunu olumlu yönde etkilediği ortaya çıkmıştır. Fakat, bitki özlerinin kullanımı, sınırlı üretime sahip olması, gelişmiş ekstraksiyon teknolojilerinin olmaması, türe, ağırlığa ve yaşa dayalı belirsiz dozaj yönergeleri, yüksek maliyet ve tutarsız etkiler dahil olmak üzere çeşitli zorluklarla karşı karşıya kalınmaktadır (Nastoh ve ark., 2024).

Tıbbi bitkiler kümes hayvanlarının performansını, bağırsak morfolojisini, besin sindirilebilirliğini ve bağırsak mikrobiyotasını olumlu yönde etkilemiştir (Abd El-Latif ve ark., 2013; Belenli ve ark., 2015; Franciosini ve ark., 2016; Ri ve ark., 2017). Tarçın takviyesi broylerlerde vücut ağırlığı artışını önemli bir şekilde artırmıştır (Singh ve ark., 2014). Kanani ve ark. (2016) yemlere %0.5 tarçın eklenmesinin yem alımının arttığı saptanmıştır. Benzer şekilde etlik piliç diyetlerine biberiye eklenmesi, yem verimliliğini olumlu yönde etkilemiştir (Petricevic ve ark., 2018).

Kümes hayvanı üretimi için fitojenik yem katkı maddesi olarak en çok kullanılan baharatlar ve otlar sarımsak, nane, kekik, yaban turpu, acı biber, tarçın, biberiye, kırmızıbiber, karabiber ve adaçayıdır ve ilgili bitki özleri uçucu yağlar şeklinde kullanılmaktadır (Windisch ve ark., 2008).

Biberiye özleri, kümes hayvanlarında yem dönüşüm oranını, karkas kalitesini ve körbağırsak mikrobiyolojik bileşimini iyileştirmektedir. Biberiye yaprak unu özütü, kümes hayvanı ürünlerinde acılaşma görünümünü geciktirmektedir. Ayrıca kümes hayvanı diyetlerinde büyümeyi teşvik etmek ve kuşların bağışıklık tepkisini artırmak için uygulanmaktadır (Petricevic ve ark., 2018).

Kümes hayvanı diyetine uçucu yağların eklenmesi, büyüme performansını, vücut ağırlığını artırmaktadır (Gopi ve ark., 2014). Birçok uçucu yağ, yararlı mikropların büyümesini teşvik etmekte, terpenoidler ve fenolik maddeler gibi patojenik mikropların büyümesini engellemekte veya sınırlamakta, membran bozulmasını önlemekte ve kümes hayvanlarında patojenik bakterilerin büyümesini engellemektedir (Krishan ve Narang., 2014).

Sonuç

Sonuç olarak, fitojenik yem katkı maddeleri, yem endüstrisinde giderek daha fazla önem kazanmakta ve popülerlik kazanmaktadır. Bu katkı maddeleri, doğal olmaları, güvenli ve sağlıklı olmaları nedeniyle tercih edilmektedir. Kekik, zerdeçal, sarımsak, tarçın ve diğer bitkisel bileşenler, kümes hayvanlarının ağırlık kazanımı, yem dönüşüm oranı, bağışıklık sistemi ve genel sağlık durumları üzerinde olumlu etkiler göstermektedir. Bununla birlikte, fitojenik yem katkı maddelerinin etkili ve güvenli dozlarının belirlenmesi, farklı bölgelerde yetişen bitkilerin ve hasat dönemlerinin standartlaştırılması gibi konular hala araştırma gerektirmektedir. Gelecekte, bu katkı maddelerinin hayvan sağlığı ve performansı üzerindeki etkilerini daha iyi anlamak ve optimize etmek amacıyla daha fazla çalışma yapılması gerekmektedir.

Abstract

Drought poses an increasing threat to global food production, necessitating sustainable agricultural practices to reduce yield and quality losses. In this study, the synergistic effects of grafted seedlings and vermicompost-V on the nutrient content of eggplant plants and their relationship with yield were investigated. The study was carried out with eggplant seedlings (grafted-G) and non-grafted-NG) in pots containing vermicompost-V (V_0: 0%, V_1: 1%, V_2: 2%, V_3: 3%) under three different drought levels (100% irrigation-, 70% irrigation, mild drought stress - MS) and 30% irrigation, severe drought stress-SS) as irrigation. The findings showed that the interaction of 'grafting x vermicompost x drought' created statistically significant differences in terms of N, P, K, Mg, Fe, Cu and Mn contents. Higher increases were observed in grafted plants under stress compared to the control due to vermicompost application. The most striking increases were 50.56% and 45.67% for N; 110.08% and 96.59% in G x V_3 under SS conditions. In terms of P content, under SS had a 116.50% increase in G x V_3. There was an increase. In terms of K content, 115.69% and 111.16% increases were evident in MS and SS in G x V_2. However, positive correlations were observed between K and N, P and Mg; Mn and Fe and Cu; Fe and Cu. On the other hand, weak and negative correlations were determined between yield and N and K; and high positive correlations were determined between Mn, Fe and Cu. The polar heatmap with dendrogram revealed that macro (N, P, K, Mg) and micro (Fe, Mn, Cu) nutrients were clustered in different groups. While a direct relationship was observed between yield and Fe, Mn and Cu, an indirect relationship was determined with N, P, K and Mg. The findings showed that grafting and vermicompost applications increased nutrient uptake under drought stress conditions and there was a close relationship between yield and nutrient elements. The results are important in terms of revealing the positive effects of sustainable agricultural practices on plant nutrition and yield in drought.

Key Words: *Eggplant, drought, vermicompost, grafted plant, correlation, yield*

Introduction

Drought, as one of the important abiotic stresses, occurs when rainfall is insufficient and evaporation exceeds water intake, and negatively affects plant growth, yield, and quality, eventually leading to plant death. Under drought stress, significant changes occur in leaf area, stomatal density, relative water content, stomatal conductance, and chlorophyll concentration in vegetables (Ors et al., 2021; Hannachi et al., 2022; Kıran and Baysal Furtana, 2023). In addition, drought significantly affects the uptake and utilization of macro (N, P, K, Mg) and micro (Fe, Mn, Cu) nutrients by disrupting water balance, restricting nutrient mobility, and impairing root function, and ultimately causes reduced plant growth and yield (Ors et al., 2021; Hannachi et al., 2022).
Eggplant (Solanum melongena) is the third most important vegetable in the Solanaceae family in terms of production (Sekara et al., 2007). Although eggplant is moderately drought resistant, prolonged drought can negatively affect plant growth and yield by disrupting metabolic activities. The use of cultivars tolerant to drought stress is an important strategy to reduce yield and quality losses. However, since this trait is controlled by many genes, it is difficult to develop drought-tolerance cultivars (Toppino et al., 2022). Grafting in eggplant can control the stomatal regulation system in plant transpiration under drought stress quite well depending on the combination of rootstock and scion and can reduce drought damage (Boyaci and Ellialtıoglu, 2018). Although grafting increases product yield and quality under water-limited conditions, it may not be sufficient alone when drought is severe. Grafting onto drought-resistant rootstocks and the use of vermicompost can increase the adaptation of plants to stress conditions. At this point, vermicompost reduces the water requirement of the plant by increasing the moisture

retention capacity of the soil (Demir, 2019) and strengthens stress tolerance by improving soil fertility (Rehman et al., 2023) (Kıran, 2019).
In this study, the effects of the combined use of grafting and vermicompost on nutrient uptake in eggplant and how these changes are related to each other and yield were investigated. The findings are important for sustainable agricultural practices and contribute to the development of plant nutrition strategies in stress conditions such as drought.

Materyal ve Yöntem

The study was carried out between April and July 2020 in the greenhouse conditions of the Soil, Fertilizer and Water Resources Central Research Institute. Temperature and humidity control were provided automatically in the greenhouse environment. Grafted and ungrafted eggplant seedlings of the Aydın Siyahı variety on the Köksal F1 rootstock constituted the plant material. The grafting process was carried out by Antalya Tarım A.Ş. When the grafted and ungrafted seedlings reached 3-4 true leaves, they were planted in 39x35 cm and 35 L volume polyethylene pots containing clayey soil (1 seedling/pot). 15 days before planting, vermicompost was added to the pots at the rates of 1%, 2% and 3% of the soil weight. Vermicompost (organic matter: 39.2%, total phosphorus: 0.21%, total potassium: 0.94%, EC: 5.62 dS m-1, pH: 6.62) was supplied by Ekosol Tarım ve Hayvancılık A.Ş., Manisa. Stress treatments were started 15 days after seedling planting and continued for 110 days. The study was carried out in randomized plots according to factorial experimental design with 3 replicates. Factors: 1. Grafting (grafted-G, non-grafted-NG plants), 2. Vermicompost application (V0: 0%, V1: 1%, V2: 2%, V3: 3% (w/w)), 3. Drought stress (100% irrigation-well watered,WW), 70% of the water given to control (mild drought stress- MS) and 30% (severe drought stress - SS). The water amount of the pots was determined on the basis of weight. Before applying drought stress, all plants were watered at field capacity level and stress was created by applying limited irrigation with different water amounts. MS and SS subjects were given 70% and 30% of the water amounts given to the control, respectively. Field capacity was taken as the basis for irrigation. The total weight of the pots was determined when the soil moisture content was at field capacity and wilting point levels. Daily pot weighing was done to monitor the amount of water lost and the amount of water lost was completed in accordance with the subject. According to the soil analysis results, the deficient fertilizer need of the plants was met.
N, P, K, Ca, Fe, Zn, Cu analyses were carried out in plant leaf samples. Total N amount was determined in dried and ground leaf samples using the Leco TruSpec-CHN device according to the Dumas method. For P, K, Ca, Fe, Zn, Cu analyses, leaf samples were weighed as 0.25 g and wet-digested with nitric acid (HNO_3) in a microwave device, then these samples were transferred to a 50 ml container and the volume was completed with deionized water and filtered through blue band filter paper. Total K was determined in the plant solution obtained using the wet-digested method using the Jenway PFP 7 Flame photometer (Kacar and İnal, 2008). Total phosphorus in the plant solution obtained using the wet-digested method was determined using the Shimadzu UV-160 Spectrophotometer according to the vanadomolybdenum phosphoric yellow color method (Kacar and İnal, 2008). Ca, Fe, Cu, Zn contents in the filters obtained according to the burning method were determined in Varian 720-ES ICP-OES (Kacar and İnal, 2008).
Total yield (kg plant^{-1}): Fruits collected from the first harvest to the last harvest date of each application subject were weighed. The obtained values were collected cumulatively and total yield per plant (kg plant^{-1}) was calculated.
The numerical data obtained from the experiments were subjected to variance analysis using MSTAT-C software, and differences were expressed with Duncan's multiple comparison test. Correlation analysis was performed to evaluate the relationships between the examined traits and expressed with a heatmap. The clustering between the variables was visualized with a dendrogram polar heatmap. Origin-2024 (Northampton, MA, USA) software was used for both analyses.

Bulgular ve Tartışma

The effects of grafting x vermicompost x drought stress interaction on N, P, K, Mg, Fe, Cu and Mn contents and yield were found to be statistically significant ($p<0.05$) (Table 1). However, there was no significant effect in terms of Ca content ($p>0.05$) (Table 1). Drought stress caused a slight increase in N, P, K and Mg contents of ungrafted and vermicomposted plants. These increases can be attributed to the increase in nutrient concentration with the decrease in water, changes in root morphology and adaptive mechanisms of the plants. However, combined grafting and V applications caused increases in macro and micro element contents compared to control (ungrafted and without vermicompost = without G and without V). Especially as the vermicompost dose increased, higher N, P, K and Mg accumulations were observed in the leaves of grafted plants under stress. Nitrogen content increased by 50.56% and 45.67% under MS and SS at G x V3 dose compared to control. The highest increase in phosphorus content was observed in G x V3 combination with 116.50% in SS, while K content increased by 115.69% and 111.16% with G x V2 application under MS and SS. While Mg concentration decreased significantly in SS

medium, a significant increase of 53.80% was obtained with G x V1 application under MS. It was thought that N content might have increased more for the synthesis of special proteins effective in the stress tolerance mechanism of grafted plants under stress (Da Silva et al., 2011). The improved root structure of the grafted plants and the increased mineralization due to the use of vermicompost had a positive effect on the N uptake of the plants. The addition of vermicompost to the growing medium increased P mineralization in the soil and ensured its transformation into a useful form in the soil, allowing the grafted plants to take phosphorus more easily (Uma and Malathi, 2009; Farahani et al., 2020) and supported the stress tolerance of the plant. In addition, the effective root system of the Köksal F1 eggplant rootstock, which is a S. incanum hybrid used in grafting the plants, made a significant contribution to the tolerance to drought stress. Grafting onto a suitable rootstock is effective as a technique that increases drought tolerance, and in a previous study, this rootstock positively affected the drought stress tolerance of the grafted variety (Kıran et al., 2017). Vermicompost applications increase the usefulness of nutrients in the soil due to the activity of microorganisms responsible for the fixation, mineralization or dissolution of the nutrients it contains and the presence of high molecular weight acids that help dissolve some nutrients in the soil, and reduce the leaching of nutrients due to the increase in the negative charges of the soil by OH- in worm compost (Cruz et al., 2024). The emergence of more K and Mg accumulations with the use of vermicompost in eggplant plants grafted onto strong rootstocks can be attributed to the fact that stressed plants accumulate more K and Mg ions in their bodies in order to maintain turgor pressure, ion homeostasis and continue photosynthesis. Rootstocks used in grafted plants provide stress tolerance by increasing stomatal regulation and capacity in leaves by increasing K uptake (Mengel et al., 2001). In fact, there is information in the literature that vermicompost, as an organic material rich in K, has the ability to improve soil properties (Sinha et al., 2010).

The variance between the means expressed with different letters is significant (p<0.05).

In the study, as in Mn content, increasing losses were also observed in Fe and Cu contents with stress and increases were obtained in the amount of these elements under stress conditions thanks to the interaction of grafting and vermicompost. In terms of Mn content, G x V1 provided 41.36% increase in SS. A similar trend was observed in Fe and Cu concentrations and the highest increase rates were realized in MS and SS conditions with G x V3 (110.08% and 96.59%; 70.89% and 44.84%) (Table 2). Root hydraulic conduction in grafted plants and developed root system of the rootstock provided increases in Mn, Fe and Cu contents. In the study, Fe and Mn uptake by plants remained at low levels in SS and was relatively higher in MS. Vermicompost enriched the soil in terms of Fe and Mn and helped the availability of nutrients in dry conditions by secreting plant growth regulators in the plant rhizosphere thanks to the beneficial microorganisms it contains (Rangarajan et al., 2008). Similar results were reported by Tang (2018) and Kıran et al. (2017).

In the study, it was also examined how the changes in nutrient contents are related to each other and to yield, for this purpose, correlation analysis was performed and the results are given in Figure 1. In the correlation analysis; positive relationships were observed between K and N and P; Mg and K; Mn and Fe and Cu. However, the correlation between nutrient contents and yield was also examined. While it was noted that yield exhibited weak negative relationships with macro elements N and K, it was determined that it showed relatively strong positive relationships with Mn, Fe and Cu. The negative correlation between N and K and yield suggests that excessive N or K accumulation, especially under drought conditions, may have negative effects on plant growth. Although N and K are critical nutrients for plant growth under normal conditions, they may have negative effects under drought stress. N is necessary for protein synthesis, photosynthesis and growth in the plant. However, excessive N intake can promote vegetative growth under drought conditions; this situation can reduce stress tolerance by increasing water loss. In addition, excessive N can cause carbon and nitrogen imbalance, negatively affecting the synthesis of osmoprotectants (proline, sugar, etc.) and thus reducing drought tolerance (Du et al., 2017). As a result, it is possible that the yield will be low and a negative correlation will occur. On the other hand, the relationship between high K levels and reduced yield may be due to antagonistic nutrient interactions. The relatively strong positive correlation between Mn, Fe, and Cu and yield indicates that these microelements play critical roles in stress tolerance and metabolic processes. Mn, Fe, and Cu are micronutrient elements that play an important role in drought tolerance, and high levels of these elements are seen as factors that positively affect yield. Mn deficiency can negatively affect photosynthesis and carbon metabolism; however, high levels of Mn may have increased yield by protecting these processes (Messant et al., 2022). High Fe levels in drought conditions can reduce chlorosis and increase photosynthetic capacity. High Fe can support ATP production by improving photosynthetic electron transport and contribute to yield by providing energy balance under stress conditions (Briat et al., 2015). In addition, Cu is necessary for lignin synthesis and cell wall stability (Li et al., 2023). Under drought stress, plants can contain more Cu against oxidative stress, which can prevent cell damage and help maintain growth (Chen et al., 2022).

The polar heatmap with dendrogram visualizes the relationship between yield and nutrients in grafted/non-grafted plants and vermicompost applications at different drought levels (Figure 2). Temperature differences in the polar heatmap indicate clustering; if high temperatures (red tones) are concentrated in a certain area, this may indicate that the area forms a cluster. Similarly, low temperatures (blue tones) may also show a tendency to cluster. The clustering structure of nutrients reveals that certain elements act together. In this context, macronutrients (N, P, K, Mg) and micronutrients (Fe, Mn, Cu) were located in different groups and exhibited direct relationships among themselves. However, while high nutrient intake represented by dark red came to the fore in control conditions, it was observed that nutrient intake decreased in MS (light red tone) and MS conditions (blue tone). The dendrogram in the heatmap shows that red tones are more dominant in grafted plants grown in vermicomposted environments, meaning that nutrient uptake is better maintained under drought conditions and yield is higher. This is a result of the synergistic interaction between the fact that grafted plants generally have a stronger root system and can increase nutrient uptake under stressful conditions, and the fact that vermicompost improves soil structure and supports plant nutrient uptake. The fact that the color tone does not shift to blue, especially under drought conditions, reveals the power of the synergy of grafting and vermicompost. On the other hand, the fact that blue areas are more common in non-grafted and low vermicompost doses shows that nutrient loss is more pronounced in these groups and yield losses increase due to stress.

In conclusion, our findings suggest that the interaction of grafting, vermicompost and drought stress significantly affects nutrient uptake and yield. Grafted plants grown in vermicompost enriched soil maintained higher nutrient levels and yield under drought stress as expressed by the predominance of red tones in the heatmap. The clustering pattern also revealed strong positive correlations between micronutrients (Fe, Mn, Cu) and their relationship with yield, while excessive N and K accumulation showed a weak negative correlation with yield under drought conditions.

Abstract

Biogenic amines are nitrogenous substances produced through the decarboxylation of amino acids by the action of substrate-specific amino acid decarboxylases. They are health-threatening substances, and excess consumption can cause health problems such as nausea, respiratory distress, hot flush, sweating, heart palpitations, headache, hyper/hypotension, etc. Various groups of microorganisms, including lactic acid bacteria, *Enterococcus*, *Bacillus*, and *Pseudomonas*, have been reported to have amino acid decarboxylase activities. The risk of biogenic amine formation is especially high in fermented foods. Moreover, it can also be found in some raw foods. Amongst the biogenic amines, cadaverine, histamine, putrescine, and tyramine are the most common, which are formed by the decarboxylation of lysine, histidine, ornithine, and tyrosine, respectively. In this study, biogenic amine formation abilities of various *Bacillus* strains isolated from tarhana samples were detected. For this purpose, a colorimetric method was applied, which is based on the pH shift (increase) upon the formation of biogenic amines in the presence of a pH indicator dye (bromocresol purple). The bacteria were cultivated in Luria Bertani broth at an initial pH of 5.0 containing precursor amino acids, namely lysine, histidine, ornithine, and tyrosine. At the end of 24 h incubations at 37 °C with agitation at 60 rpm, absorbances of the cell-free supernatants were measured at 590 nm. The highest absorbance values were recorded as higher biogenic amine formation. Control samples without precursor amino acids were also prepared. The percent increase in the absorbance was the rate of biogenic amine formations. Ninety-five *Bacillus* isolates were tested for four biogenic amine formations. The results showed that the type and the amount of biogenic amine production in *Bacillus* were directly related to the organisms.

Abstract

Tarhana is a Turkish fermented food that is consumed extensively all over the country. It is mainly produced by fermenting the dough prepared using wheat flour, yogurt, water, some vegetables, and spices. Then the fermented dough is dried and consumed as soup after grinding. There are many different types of tarhana depending on the region. The main fermentation microorganisms in tarhana are lactic acid bacteria and yeasts. However, in this study we have intended to isolate *Bacillus* strains from tarhana samples. Strains of the genus *Bacillus* are Gram-positive, endospore-forming aerobic or facultatively anaerobic, and generally found in soil. They have substantial applications in the industry owing to their multifunctional properties, including the production of various enzymes, exopolysaccharides, antimicrobial substances, etc. In the study, more than 80 tarhana samples were collected from different regions in Türkiye. For the isolation, diluted samples were kept at 80 ºC for 30 min to destroy non-spore-forming microorganisms. The serial dilutions were prepared and inoculated on nutrient agar plates. Then they were incubated at 37 ºC for 24 h. Typical colonies were chosen and streaked again on nutrient agar plates and incubated. These procedures were repeated thrice in order to assure the selection of single colonies. A total of 480 microorganisms were isolated. The isolates were deposited in 25% glycerol at -45 ºC. Gram staining, spore-formation, catalase, and motility tests were applied to confirm the *Bacillus* isolation. The results revealed that the tarhana is also a rich source of *Bacillus* strains. Moreover, the amylolytic and proteolytic activities of the isolates were also determined, and the majority of the isolates were able to produce amylase and proteases.

Abstract

Allelopathy, the chemical interaction between plants, offer a promising approach for sustainable weed management, aligning with the congress's focus on innovative and eco-friendly agricultural practices. This study investigated the influence of wheat cultivars on little seed canary grass (*Phalaris minor* Retz.) through field experiment and a laboratory study. The field study was conducted during 2010-11 and 2011-12 at the Experimental Farm, Department of Agronomy, University of Agriculture, Faisalabad-Pakistan. It examined the impact of wheat cultivars (Shafaq-06 and Sehar-06 representing high and low allelopathic potential, respectively) sowing at 05 different row spacings (10 cm, 15 cm, 20 cm, 25 cm and 30 cm) on weed suppression. Results demonstrated that narrow row spacing (10 cm and 15 cm) significantly reduced little seed canary grass density and biomass accumulation with Shafaq-06 exhibiting superior weed suppression compared to Sehar-06. The laboratory study was conducted during 2012-13 at the Crop and Soil Sciences Department, Oregon State University, USA. It assessed that allelopathic effect of fresh and boiled water extracts from US Wheat cultivars (Marry, Stephen, Shafaq-06 and Sehar-06) on little seed canary grass seedling growth. Boiled extracts, particularly at 45 days after sowing (DAS), showed stronger inhibitory effects, with Marry and Stephen extracts reducing shoot length by 52% and 48%, respectively, and shoot dry weight by up to 37%. Phenolic compounds analysis confirmed their critical role in allelopathic activity. These findings highlights the potential of high-allelopathic wheat cultivars, such as Shafaq-06, Marry, and Stephen, combined with the optimized row spacing, as effective tools for integrated weed management. This approach supports the Congress's emphasis on reducing reliance on chemical herbicides and promoting sustainable agricultural practices, contributing to environmentally friendly and economically viable farming system.

Impact of Defatted Sesame Meal on the Technological and Sensory Quality and Antioxidant Activity of Gluten-free Buckwheat Crackers

Elif Yaver[1]

[1]Department of Food Processing, Vocational School of Technical Sciences, Konya Technical University, Konya, Türkiye
elifyaver@hotmail.com / ORCID No: 0000-0002-2651-9922

Abstract

Currently, a gluten-free diet is the sole successful remedy for celiac disease. However, it is difficult for celiac patients to access commercially functional gluten-free foods. Defatted sesame meal as a by-product of the cold-pressed sesame oil production process is a good option to enrich gluten-free crackers because of its rich protein and fiber content. In the present study, defatted sesame meal was used to develop gluten-free cracker formulations. Gluten-free flour blend containing buckwheat flour:corn starch (7:3, w/w) was substituted with defatted sesame meal at 0, 5, 10, 15 and 20% levels. The effect of defatted sesame meal on the technological properties, antioxidant activity and sensory quality of gluten-free cracker samples were evaluated. The moisture contents of gluten-free buckwheat crackers containing 5, 10 and 15% defatted sesame meal were close to the control (0% sesame meal). The inclusion of sesame meal did not show adversely influence on the diameter and thickness values of buckwheat crackers. Compared to the control, samples made from 10 and 15% sesame meal exhibited higher spread ratio values. Samples with sesame meal exhibited a significantly ($p<0.05$) increased total phenolic content relative to the control. Moreover, crackers prepared from 15% (2.82 µmol TE/g) and 20% (2.90 µmol TE/g) sesame meal showed strong antioxidant properties. Sensory evaluation showed that high levels of sesame meal improved the appearance of crackers compared to the control. The incorporation of sesame meal up to 15% gave comparable overall acceptability to the control. The data revealed that defatted sesame meal (up to 15%) is a good alternative to improve the antioxidant capacity of gluten-free crackers with acceptable technological and sensory quality.

Key Words: *Gluten-free, Crackers, Sesame, By-product, Functional food*

Introduction

Celiac, an autoimmune disease, is one of the most common food intolerances worldwide and can occur at any age (Rivera et al., 2013). The gluten-free market has grown rapidly year on year and is expected to reach 7.5 billion dollars by 2027 (Kajzer and Diowksz, 2021). Developing special products for this market is an important opportunity for manufacturers.

Crackers are one of the popular cereal-based snacks worldwide. They can be easily enriched with functional constituents such as protein- and fiber-rich by-products. Tomic et al. (2022) incorporated pumpkin seed press cake flour into gluten-free chickpea crackers. They found that replacing chickpea flour with pumpkin seed meal improved the protein content and antioxidant activity of crackers, and improved their taste and flavor. Akeem et al. (2023) produced gluten-free crackers using composite flour containing germinated pearl millet+defatted sesame+tigernut flour. They stated that adding composite flour enhanced ash, fiber, protein, and calcium contents of crackers and improved their protein digestibility compared to the control.

Sesame (*Sesamum indicum*) seeds are a good source of unsaturated fat, protein, dietary fiber, vitamins, minerals (iron and calcium) and antioxidant compounds. Also, they contain lignans such as sesamol, sesamolin, sesamin and sesaminol which could exhibit anti-hypertensive, anti-inflammatory, anti-carcinogen and antioxidant features (Wei et al., 2022). Defatted sesame meal is a by-product of cold-pressed sesame oil production. It contains about 50% protein, dietary fibers and bioactive compounds (Melo et al., 2021).

To the best of my knowledge, this study represents the first research on the effect of cold-pressed sesame meal on the quality of gluten-free buckwheat crackers. Therefore, the objective of this study is to develop functional gluten-free crackers by adding defatted sesame meal at 0, 5, 10, 15 and 20% levels, and to investigate the impact of sesame meal addition on the moisture content, diameter, thickness and spread ratio, total phenolic content, antioxidant activity and sensory properties of gluten-free buckwheat crackers.

Materials and Methods

Materials

Light buckwheat flour was supplied from Bulvar Gıda (Konya, Türkiye). Corn starch, shortening, salt, caster sugar, baking powder and yeast were procured from a local supermarket in Konya, Türkiye. Cold-pressed defatted sesame meal was kindly donated by Neva Gıda, İstanbul, Türkiye. Xanthan gum was purchased from Smart Kimya, İzmir, Türkiye.

Methods

Preparation of gluten-free crackers

Gluten-free control crackers (0% sesame meal) were prepared by mixing 250 g of gluten-free flour blend (buckwheat flour:corn starch, 7:3, w/w), 50 g of shortening, 4 g of salt, 3.75 g of caster sugar, 3.75 g of baking powder, 2.5 g of yeast, 2.5 g of xanthan gum and water. Crackers containing defatted sesame meal were incorporated into four different levels (5, 10, 15 and 20%). The dough was fermented at 35°C for 2 h. After that, it was sheeted and cut into a circular shape. Cracker doughs were baked (Kumtel LX-9645, Kayseri, Türkiye) at 175°C for 9 min.

Laboratory analysis

The moisture content of samples was determined by a rapid moisture analyzer (Shimadzu M0C63u, Kyoto, Japan).

Diameter and thickness of crackers were measured via a caliper. To find spread ratio, the diameter was calculated by dividing the thickness.

Phenolic compounds were extracted by the method of Yaver (2023). Two grams of sample were reacted with 20 mL of methanol:distilled water:HCl (8:1:0.1, v/v/v) at 30°C for 2 h. The extracts were subjected to centrifugation (Nüve NF800, Ankara, Türkiye) at 3000 rpm for 10 min. The Folin-Ciocalteu reagent method described by Yaver (2023) was used to determine the total phenolic content of crackers. The antioxidant activity of crackers was determined by the DPPH assay (Yaver, 2023).

Sensory evaluation of gluten-free crackers was carried out by 12 panelists using a 9-point hedonic scale (1; extreme disliking, 9; extreme liking). Panelists assessed the taste, odor, appearance, crispness and overall acceptability parameters.

Statistical analysis

The data were analyzed and compared with the Tukey HSD test at a significance level of $p<0.05$ using JMP 5.0 (SAS, North Carolina, USA).

Results and Discussion

Moisture content and diameter, thickness and spread ratio values of gluten-free buckwheat crackers are given in Table 1. The moisture content of crackers ranged between 6.13% and 6.59%. Compared to the control gluten-free buckwheat crackers, samples containing 20% defatted sesame meal had a slightly higher moisture content. The rich dietary fiber content of sesame meal may be responsible for this increase in moisture content (Melo et al., 2021).

Table 1. Moisture content and technological features of gluten-free crackers

Crackers	Moisture (%)	Diameter (mm)	Thickness (mm)	Spread ratio
Control	6.13±0.10^{b}	49.19±0.44^{a}	1.45±0.21^{a}	33.92±0.20^{c}
5%	6.18±0.08^{b}	49.13±0.54^{a}	1.50±0.25^{a}	32.75±0.25^{d}
10%	6.26±0.06^{ab}	49.29±0.51^{a}	1.33±0.24^{a}	37.06±0.28^{a}
15%	6.37±0.10^{ab}	49.59±0.48^{a}	1.32±0.25^{a}	37.57±0.25^{a}
20%	6.59±0.07^{a}	49.78±0.49^{a}	1.42±0.28^{a}	35.06±0.20^{b}

Values within the same column that are accompanied by distinct letters show a significant difference ($p<0.05$).

The diameter and thickness values of gluten-free crackers changed between 49.13-49.78 mm and 1.32-1.50 mm, respectively (Table 1). There were no notable differences between crackers' diameter and thickness. This revealed that incorporation of defatted sesame meal (up to 20%) does not display a negative impact on the diameter and thickness values of gluten-free crackers. It was also found that when the amount of sesame meal increased from 0% to 10%, spread ratio value increased from 33.92 to 37.06. The increase in spread ratio may be due to the decreasing gluten content as a result of defatted sesame flour addition (Shahzad et al., 2021). Similar findings have been reported for crackers made with composite flour containing defatted sesame flour by Akeem et al. (2023). On the other hand, crackers prepared with 20% sesame meal had a lower spread ratio than crackers made with 10 and 15% sesame meal (Table 1). This result could be attributed to the high protein and fiber content of defatted sesame meal, which could bind to available water and increase viscosity (Giuberti et al., 2018; Melo et al., 2021). The antioxidant properties of gluten-free samples enriched with defatted sesame meal are presented in Table 2. Sesame meal incorporated crackers exhibited a progressive and considerable increase in the phenolic content by

increment of sesame meal level. The presence of phenolic components in sesame meal, mainly lignans, could be responsible for this increase in total phenolic content (Melo et al., 2021).

Table 2. Total phenolic content and antioxidant activity of gluten-free crackers

Crackers	Total phenolic content (mg GAE/100 g)	Antioxidant activity (µmol TE/g)
Control	70.00±0.92^{e}	2.61±0.06^{c}
5%	77.36±0.98^{d}	2.64±0.03^{bc}
10%	96.25±1.13^{c}	2.73±0.04^{abc}
15%	101.61±1.04^{b}	2.82±0.05^{ab}
20%	109.89±0.97^{a}	2.90±0.03^{a}

Values within the same column that are accompanied by distinct letters show a significant difference ($p<0.05$).

The inclusion of defatted sesame meal elicited great results of antioxidant activity in gluten-free crackers, changing from 2.61 to 2.90 µmol TE/g (Table 2). Hafez (2018) found that defatted sesame meal showed high antioxidant activity. The high antioxidant activity of crackers may be associated with lignans in sesame meal, which have antioxidant activity (Sarkis et al., 2014; Shu et al., 2019).
Sensory scores of gluten-free buckwheat crackers are demonstrated in Figure 1. Crackers enriched with 5 and 10% sesame meal elicited similar taste scores to the control. However, higher levels (15 and 20%) of sesame meal decreased taste scores of crackers. On the contrary, increasing level of sesame meal increased odor score of gluten-free crackers. Moreover, gluten-free crackers produced with 10, 15 and 20% sesame meal revealed greater appearance scores than crackers produced with 0 and 5% sesame meal. There were no notable differences between the crispness scores of control and sesame meal-enriched crackers. Regarding the overall acceptability parameter, the enrichment of gluten-free crackers with defatted sesame meal up to 15% revealed similar scores to the control. However, the overall acceptability score of crackers made from 20% sesame meal was lower than the control. Prakash et al. (2018) stated that consumers liked the incorporation of defatted sesame meal up to 50% into biscuit formulation in terms of color, odor, crispiness and taste parameters.

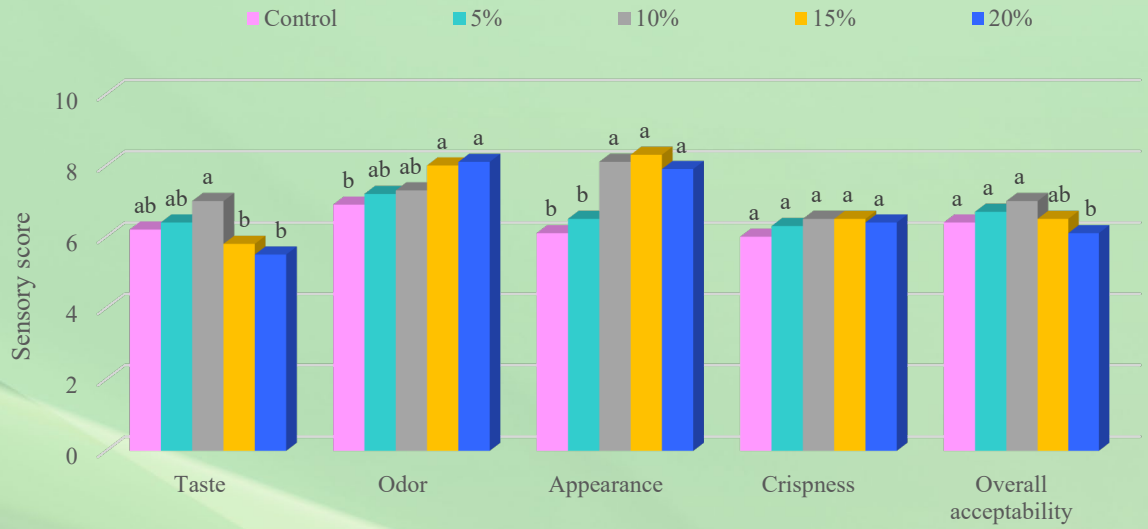

Figure 1. Sensory evaluation of gluten-free crackers

As a conclusion of this study demonstrated that defatted sesame meal (up to 15%) is a good ingredient to improve antioxidant activity of gluten-free crackers as well as acceptable technological and sensory quality. Compared to the control, sesame meal-enriched crackers (up to 15%) revealed a higher spread ratio, stronger antioxidant activity and acceptable sensory quality.

Abstract

Banana (*Musa spp.*) is a staple crop providing food security and economic benefits to millions globally. However, its production is severely threatened by biotic and abiotic stresses, including Fusarium wilt, Black Sigatoka, Banana Xanthomonas Wilt, and climate-related challenges. Traditional breeding approaches in banana are hindered by long breeding cycles, polyploidy, and sterility in most cultivated varieties, making genetic improvement challenging. Recent advances in molecular breeding, including marker-assisted selection (MAS), genome-wide association studies (GWAS), and next-generation sequencing, have revolutionized banana improvement by enabling precise trait selection. The application of genetic transformation and CRISPR/Cas9 genome editing has further enhanced the development of disease-resistant and biofortified banana varieties, offering sustainable solutions to production constraints. Despite these advancements, challenges remain in gene introgression, regulatory frameworks, and farmer adoption of genetically improved bananas. Future research should focus on refining genome editing techniques, expanding genomic resources, and integrating artificial intelligence in breeding programs to accelerate cultivar development. This review highlights the progress in molecular banana breeding, discusses existing challenges, and explores emerging opportunities for ensuring banana resilience and productivity in the face of evolving environmental and disease pressures.

Introduction

Banana (*Musa spp.*) is one of the most important staple crops worldwide, serving as a primary source of food, income, and nutrition for over 400 million people, particularly in tropical and subtropical regions (FAO, 2021). Globally, banana production exceeds 155 million metric tons annually, with major producers including India, China, Indonesia, Brazil, and the Philippines (Tripathi *et al*., 2020). In Africa, Uganda, Rwanda, and the Democratic Republic of Congo are among the leading producers, where bananas contribute significantly to food security and livelihoods (Karamura *et al*., 2019). Latin America, particularly Ecuador, Colombia, and Costa Rica, is a major exporter of bananas, supplying global markets, especially in Europe and North America (FAO, 2021).

Challenges in Conventional Banana Breeding

Despite its economic and nutritional importance, banana breeding faces significant challenges. Most cultivated banana varieties, such as the Cavendish and East African Highland bananas, are triploid and sterile, preventing natural recombination and seed-based breeding (Ortiz & Swennen, 2014). Traditional breeding is further hindered by the long reproductive cycle and vegetative propagation, which increases the risk of disease accumulation over successive generations (Perrier *et al*., 2019). The prevalence of devastating diseases, including Fusarium wilt (Tropical Race 4), Black Sigatoka, and Banana Xanthomonas Wilt, further complicates breeding efforts, as resistant cultivars are difficult to develop through conventional methods (Tripathi *et al*., 2020).

Given the limitations of conventional breeding, molecular approaches have emerged as powerful tools for banana improvement. Advances in marker-assisted selection (MAS), genome-wide association studies (GWAS), and genomic selection (GS) have facilitated the identification and introgression of resistance genes, accelerating the breeding process (Ahmadi *et al*., 2021). Additionally, genetic transformation techniques, such as RNA interference (RNAi) and CRISPR/Cas9 genome editing, have enabled targeted modifications for disease resistance and enhanced nutritional content (Tripathi *et al*., 2019). The complete sequencing of the banana genome has provided valuable insights into genetic diversity and trait inheritance, allowing breeders to develop improved cultivars with greater efficiency (D'Hont *et al*., 2012). As climate change and emerging diseases continue to threaten banana production, integrating molecular breeding strategies with conventional methods is essential for ensuring sustainable production and food security.

Genetic and Genomic Advances in Banana

Genome Sequencing of Banana (Musa spp.)

The sequencing of the banana genome has provided critical insights into its genetic diversity, evolutionary history, and potential for breeding improvement. The first draft genome sequence of *Musa acuminata* was published by D'Hont *et al*. (2012), marking a major breakthrough in banana genetics. This sequencing effort revealed that the banana genome is highly complex due to polyploidy and extensive segmental duplications. The reference genome of *Musa acuminata* (AA genome) provided insights into disease resistance genes, stress tolerance pathways, and fruit development mechanisms (D'Hont *et al*., 2012).

Subsequent sequencing efforts focused on the *Musa balbisiana* (BB genome), which contributes to drought tolerance and disease resistance in many cultivated hybrids (Wang *et al*., 2019). More recently, improved genome assemblies have been generated using third-generation sequencing technologies, such as PacBio and Oxford Nanopore, providing higher resolution and facilitating more precise gene annotation (Belser *et al*., 2021). These advancements enable researchers to explore gene-editing strategies and accelerate the development of improved banana cultivars.

Important Genetic Markers (SNPs, SSRs) and Their Applications

Molecular markers play a crucial role in banana breeding by enabling precise selection of desirable traits. Among the most widely used markers are single nucleotide polymorphisms (SNPs) and simple sequence repeats (SSRs).

- **SNP Markers:** SNPs are single-base variations in DNA sequences and are highly abundant in the banana genome. They are widely used in genome-wide association studies (GWAS) and marker-assisted selection (MAS) to identify genes associated with disease resistance and fruit quality (Brown *et al*., 2017). SNP-based genotyping has improved the efficiency of selecting Fusarium wilt-resistant and drought-tolerant banana varieties (Nyine *et al*., 2018).
- **SSR Markers:** SSRs, also known as microsatellites, consist of short, repetitive DNA sequences that are highly polymorphic. They have been extensively used for genetic diversity studies, cultivar fingerprinting, and parentage analysis in bananas (Christelová *et al*., 2017). SSR markers have been instrumental in identifying genetic variability among cultivated and wild banana species, aiding in conservation efforts and pre-breeding programs.

The integration of high-throughput sequencing technologies with SNP arrays and SSR markers has significantly enhanced banana breeding programs. These tools facilitate genomic selection, allowing breeders to predict the performance of hybrids before field trials, thus accelerating the breeding cycle (Perrier *et al*., 2019).

Key Challenges in Banana Breeding

Long Breeding Cycle

Banana breeding programs are hindered by the long reproductive cycle of the plant, which typically spans 2-3 years for the evaluation of hybrids (Ortiz *et al*., 2010). The lack of sexual reproduction in most cultivated banana varieties, which are sterile triploids, further complicates the process, as they must be propagated vegetatively. This extended breeding cycle limits the rate of genetic improvement and slows down the introduction of desirable traits, such as disease resistance and improved yield (Perrier *et al*., 2019). The use of in vitro culture techniques and embryo rescue has partially addressed this issue, enabling faster multiplication of hybrids, but the overall duration remains lengthy compared to other crops (Jain & Swennen, 2010).

Limited Genetic Diversity

The cultivated banana genome is predominantly derived from a narrow gene pool, mainly from *Musa acuminata* and *Musa balbisiana*, which limits the available genetic variation for breeding (Simmonds & Shepherd, 1955). The widespread use of a few cultivars, particularly the Cavendish group, has led to a bottleneck in genetic diversity, making the crop highly vulnerable to diseases and environmental stresses (Nicol *et al*., 2020). Efforts to incorporate wild Musa species into breeding programs have been complicated by incompatibility, sterility, and undesirable traits (Swennen *et al*., 2017). These genetic constraints impede the development of new, resilient banana varieties and pose a significant challenge for long-term production sustainability.

Resistance Breakdown in Improved Varieties

Despite progress in breeding disease-resistant banana varieties, resistance breakdown remains a significant challenge. For example, the Cavendish banana, the most widely grown cultivar globally, is highly susceptible to Fusarium wilt Tropical Race 4 (TR4) (Ploetz, 2015). Initially, the Cavendish was resistant to an earlier strain of Fusarium wilt, but the emergence of TR4 has led to widespread crop losses. Similarly, resistance to Black Sigatoka, a fungal disease, is also subject to breakdown as the pathogen evolves (Alves *et al*., 2020). These challenges highlight the need for continuous genetic improvement and the incorporation of multiple resistance genes to safeguard against evolving pathogens. Integrating stacked resistance genes, genetic diversity, and gene pyramiding approaches are essential to provide durable resistance (Koenig *et al*., 2018).

Table 1. Key Challenges in Banana Breeding

Challenge	Description	Implications	Source
Long Breeding Cycle	Banana breeding takes 2-3 years for hybrid evaluation due to vegetative propagation and long reproductive cycles.	Slows down the introduction of improved traits, limiting genetic progress.	Ortiz & Swennen (2010)
Limited Genetic Diversity	Cultivated bananas mainly come from *Musa acuminata* and *Musa balbisiana*, leading to a narrow genetic pool.	Makes banana crops susceptible to diseases and environmental stresses; limits breeding opportunities.	Simmonds & Shepherd (1955); Perrier et al. (2019)
Resistance Breakdown in Varieties	Disease resistance in improved varieties, such as Cavendish, often breaks down due to evolving pathogens.	Requires continuous breeding to ensure durable resistance to diseases like Fusarium wilt and Black Sigatoka.	Ploetz (2015); Alves et al. (2020)

Molecular Breeding Techniques in Banana

Marker-Assisted Selection (MAS) for Disease Resistance

Marker-Assisted Selection (MAS) is a powerful tool in banana breeding, particularly for disease resistance. MAS relies on genetic markers (such as SNPs, SSRs) associated with resistance traits, allowing breeders to select individuals with desirable traits even before phenotypic expression. For example, MAS has been successfully used in banana breeding for resistance to Fusarium wilt Tropical Race 4 (TR4) and Black Sigatoka (Koenig *et al*., 2018). These diseases are significant threats to banana production worldwide, and MAS accelerates the development of resistant varieties. By incorporating molecular markers linked to these resistance traits, banana breeders can reduce the reliance on field screening, thus shortening the breeding cycle (Brown *et al*., 2017).

MAS has also been applied to select for improved post-harvest quality and drought tolerance in bananas, marking significant progress in improving banana varieties through genetic selection (Perrier *et al*., 2019).

Genome-Wide Association Studies (GWAS) for Trait Mapping

Genome-Wide Association Studies (GWAS) have become a crucial method for identifying genetic loci associated with complex traits in banana. GWAS involves scanning the entire genome for variants that correlate with phenotypic traits, such as disease resistance, yield, and fruit quality. Recent studies have employed GWAS to identify markers linked to resistance to Fusarium wilt, Black Sigatoka, and Banana Bunchy Top Virus (BBTV) (Perrier *et al*., 2019). This technique helps in trait mapping and enables precise genetic selection by pinpointing genes responsible for desirable traits.

By integrating GWAS with high-throughput sequencing technologies, breeders can conduct more efficient genomic selection and improve the precision of their breeding programs (Wang *et al*., 2021). This approach is valuable for enhancing the genetic potential of banana cultivars without relying heavily on traditional breeding methods, thus speeding up the development of superior varieties.

CRISPR/Cas9 Applications in Banana

The CRISPR/Cas9 genome-editing technique has emerged as a revolutionary tool in banana breeding. CRISPR/Cas9 enables precise and targeted modifications of specific genes in the banana genome, allowing for the introduction of beneficial traits without the need for traditional hybridization. This approach has been utilized to develop bananas resistant to Fusarium wilt, a devastating disease that has decimated banana plantations globally (Bortesi *et al*., 2016). By knocking out susceptibility genes or inserting resistance genes, CRISPR/Cas9 has the potential to produce bananas with improved disease resistance and other agronomic traits, such as improved nutritional content and stress tolerance.

Furthermore, CRISPR/Cas9 offers an opportunity for gene functional studies, enabling researchers to explore the role of specific genes in banana growth, development, and resistance mechanisms (Jia *et al*., 2017). While CRISPR/Cas9-based improvements in banana are still in the early stages, its application holds promise for future banana breeding programs.

Genetic Transformation and Transgenic Approaches

Genetic transformation and transgenic approaches have been applied to bananas to introduce specific traits not found naturally within the gene pool. In these approaches, foreign genes are introduced into the banana genome to improve traits such as disease resistance, yield, and nutritional value. For example, bananas have been genetically

engineered to express resistance to Banana Bunchy Top Virus (BBTV) and Fusarium wilt by introducing resistance genes from other plants (Ortiz & Swennen, 2010).

Although transgenic bananas offer significant potential, regulatory and consumer acceptance challenges have hindered the widespread adoption of genetically modified (GM) bananas. However, research into transgenic banana varieties continues, particularly in developing regions where crop loss due to disease is a significant concern. Genetic transformation methods such as Agrobacterium-mediated transformation and biolistic transformation have enabled the successful introduction of foreign genes into banana cultivars (Swennen *et al*., 2013). As regulatory frameworks for GM crops evolve, genetic transformation may become an integral part of banana breeding programs.

Case Studies and Recent Successes

Breeding Programs that Developed Disease-Resistant Bananas

Disease resistance in bananas is critical to ensuring sustainable banana production globally. Several breeding programs have successfully developed disease-resistant cultivars, particularly for Fusarium wilt (Tropical Race 4) and Black Sigatoka, two of the most destructive banana diseases.

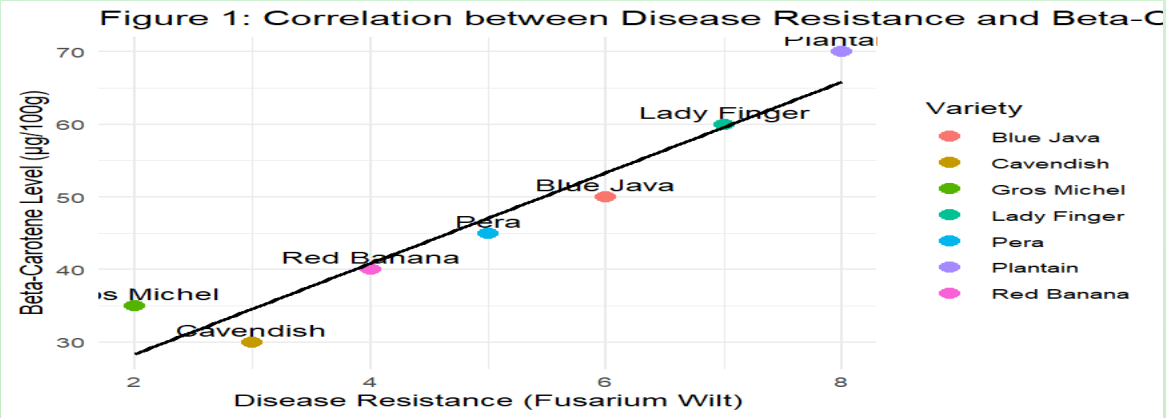
Fusarium Wilt Resistance

The International Institute of Tropical Agriculture (IITA) has led efforts to combat Fusarium wilt by using wild Musa species that show natural resistance to the disease. These wild species have been crossed with commercial varieties, and marker-assisted selection (MAS) has been used to identify and select for resistance genes. As a result, the IITA has developed Fusarium-resistant banana varieties, which are undergoing field trials in Uganda and other banana-growing regions. This approach allows the rapid development of resistant cultivars without compromising other desirable traits, such as fruit quality and yield (Ortiz & Swennen, 2010).

Black Sigatoka Resistance

The National Banana Research Program (NBRP) in Ecuador has successfully utilized marker-assisted breeding to develop banana varieties resistant to Black Sigatoka. These banana varieties demonstrate enhanced resistance to the fungal disease, enabling higher productivity with reduced fungicide applications (Perrier *et al*., 2019). The use of molecular markers linked to disease resistance traits has accelerated the process of developing these resistant cultivars.

Biofortification Efforts (e.g., Vitamin A-Enriched Bananas)



In regions where bananas are a staple crop, enhancing their nutritional content through **biofortification** has become a focus in breeding programs. Biofortified bananas, such as Vitamin A-enriched varieties, are particularly valuable in regions with high levels of Vitamin A deficiency.

Vitamin A-Enriched Bananas in Uganda

In Uganda, a collaborative effort between the International Potato Center (CIP) and the National Agricultural Research Organization (NARO) has led to the development of Vitamin A-enriched bananas. These bananas have been biofortified to contain higher levels of pro-vitamin A carotenoids, primarily beta-carotene, which can be converted to Vitamin A in the body. The bananas developed show up to a 50% increase in beta-carotene content, providing an important tool for tackling Vitamin A deficiency in vulnerable populations. Field trials in Uganda have shown positive results, with farmers expressing interest in these varieties due to their health benefits (Okao *et al*., 2019).

Figure 1 illustrates the relationship between disease resistance (specifically to Fusarium wilt) and beta-carotene levels in various banana varieties, highlighting the ongoing efforts in banana breeding programs. The x-axis represents disease resistance, with higher values corresponding to more resistant varieties, while the y-axis displays beta-carotene content (in micrograms per 100 grams of banana). The plot includes several commonly studied banana varieties, such as Cavendish**,** Pera**,** Red Banana**,** Gros Michel**,** Blue Java**,** Lady Finger**,** and Plantain**.**

The scatter plot shows the distribution of these varieties in terms of their resistance to Fusarium wilt and their beta-carotene levels. The regression line indicates the general trend, and the points represent individual varieties. While certain varieties show a strong correlation between improved disease resistance and higher beta-carotene content, others exhibit a more variable pattern. This data emphasizes the complexity in breeding for both disease resistance and biofortification, key goals in modern banana breeding programs aimed at improving both crop yield stability and nutritional quality."

Future Perspectives and Research Gaps

Banana breeding is at the crossroads of several exciting innovations and challenges that could significantly transform the industry. To meet the growing demands for improved disease resistance, nutritional value, and yield, future research must focus on the integration of cutting-edge technologies, better understanding of the genetic makeup of banana, and improved access to these varieties by smallholder farmers. The following are key future perspectives and research gaps in banana breeding.

Application of AI and Machine Learning in Banana Breeding

The integration of Artificial Intelligence (AI) and machine learning (ML) into banana breeding holds great promise for accelerating genetic improvement. These technologies allow for the analysis of large datasets, including phenotypic, genotypic, and environmental data, to predict the best-performing varieties based on specific traits. AI and ML algorithms can model complex relationships between different traits, enabling predictive breeding that reduces trial-and-error efforts in breeding programs. For instance, AI can help predict disease outbreaks, evaluate genetic diversity, and accelerate the identification of high-yield, disease-resistant varieties. While these technologies have shown great promise in other crops, their application in bananas is still in its early stages, highlighting the need for further development and adaptation to banana-specific breeding programs (Kumar *et al*., 2022).

Enhancing Genome Editing Precision

The advent of genome editing technologies like CRISPR/Cas9 has revolutionized the field of plant breeding, providing the ability to make precise genetic modifications. Genome editing tools have the potential to significantly enhance the disease resistance and nutritional quality of banana varieties, enabling faster development of biofortified and disease-resistant bananas. However, despite significant progress, the precision of genome editing tools needs further refinement to minimize off-target effects and improve the efficiency of genetic modifications. Researchers should also focus on expanding the toolkit to include base editing and prime editing, which offer greater precision in gene modifications (Zhao *et al*., 2021). Additionally, regulatory challenges and public acceptance of genetically modified organisms (GMOs) in banana production need to be addressed to ensure the widespread application of genome editing technologies.

Improving Smallholder Adoption of Improved Varieties

While significant progress has been made in developing improved banana varieties, the adoption of these varieties by smallholder farmers remains a critical challenge. Farmers, particularly in Sub-Saharan Africa and Southeast Asia, often face barriers to accessing improved banana cultivars, including high costs, lack of technical knowledge, and poor infrastructure for seed distribution. Moreover, many smallholder farmers are hesitant to adopt improved varieties due to concerns about market demand, seed availability, and the risk of crop failure. To overcome these barriers, future research should focus on improving seed distribution systems, enhancing farmer education programs, and conducting socio-economic analyses to ensure that improved varieties are economically viable for smallholder farmers. The adoption of community-based breeding programs and farmer-participatory approaches could help increase trust and participation in banana breeding programs (Mubiru *et al*., 2020). Additionally, policies supporting subsidies for seed purchase and post-harvest technologies could help increase adoption rates.

Closing Research Gaps

Despite advances in banana breeding, several research gaps remain. Understanding the genetic mechanisms underlying complex traits, such as disease resistance and drought tolerance, is still limited. More comprehensive genomic studies, particularly in under-researched banana species and cultivars, are required to identify genetic loci

associated with these traits. Furthermore, the banana microbiome plays a crucial role in the plant's health, and future research should explore how microbial communities affect disease resistance and nutrient uptake in bananas (Smith *et al*., 2021). Finally, climate change is expected to alter banana production in many regions, making it imperative to study the potential impacts of climate stressors on banana growth and develop varieties resilient to changing environmental conditions.

Conclusion

Banana breeding has made significant strides in recent years, thanks to advances in molecular tools and technologies. However, challenges such as long breeding cycles, limited genetic diversity, and the need for improved disease resistance continue to pose obstacles for the development of better banana varieties. This review has highlighted the importance of integrating molecular breeding techniques**,** such as marker-assisted selection (MAS)**,** genome-wide association studies (GWAS)**,** and genome editing tools like CRISPR/Cas9, to accelerate banana improvement programs. The application of these tools has not only enabled the development of disease-resistant varieties but has also opened new possibilities for biofortification, such as increasing the levels of beta-carotene and other essential nutrients in bananas..

Democratization of Crop Irrigation: An Intelligent Approach Combining IoT, Machine Learning, and Social and Solidarity Economy

Abdelaziz Elfazziki[1], Mohamed Yassine Samiri[2]

[1]Computer Science Engineering Laboratory 'LISI' Faculty of Sciences Semlalia Cadi Ayyad University, Marrakech, Morocco.
[2]Laboratory of Computer Engineering and Systems, Faculty of Legal, Economic, and Social Sciences, Kelâa des Sraghna, Cadi Ayyad University, Marrakech, Morocco.

Abstract

Equitable access to efficient irrigation remains a major challenge for smallholder farmers, particularly in regions like Morocco, where water access inequalities hinder agricultural productivity and exacerbate socio-economic disparities.
This project proposes an innovative solution to optimize irrigation by combining advanced technologies (IoT and machine learning) with collective governance models and participatory financing based on Islamic finance, aiming to promote sustainable and inclusive water resource management.
The project relies on an IoT platform to collect real-time data on soil moisture and weather conditions, while machine learning algorithms optimize irrigation schedules. A blockchain-based architecture ensures transparency and traceability of transactions, and a participatory financing model, inspired by the social and solidarity economy, promotes the inclusion of smallholders.
This initiative enables more efficient and equitable water management, reducing waste and improving agricultural productivity. It also strengthens trust among stakeholders through blockchain and fosters the socio-economic inclusion of rural communities.
By integrating cutting-edge technologies and collaborative approaches, this project offers a sustainable model for democratizing irrigation, maximizing its socio-economic and environmental impacts. It represents a promising pathway to address water management challenges in vulnerable agricultural regions.

Evaluation of the Reuse of Historical Buildings: The Case of Osmaniye Salih Sefa Yazar Folklore House

Elife Büyüköztürk[1]

[1] Department of Architecture, Osmaniye Korkut Ata University, Osmaniye, Turkey.

Abstract

The preservation of historical buildings, which convey the socio-cultural characteristics of their respective periods to the present day, is of great importance for the sustainability of cultural heritage. The adaptive reuse of these structures, which have become functionally obsolete due to their inability to meet contemporary needs, is a widely preferred method. This study examines the adaptive reuse of Salih Sefa Yazar Folklore House, one of the few registered buildings in the city center of Osmaniye, where architectural heritage conservation efforts are limited. The study aims to investigate, evaluate, and document the functional and spatial transformations resulting from the adaptation of this significant historical structure.

Originally constructed in the early 1930s by the Askerler family, the building was purchased by the Osmaniye Municipality in 2004. The restoration project was completed in 2009, and the building was reopened as the Salih Sefa Yazar Folklore House. During the restoration process, the original staircase located in the courtyard was relocated inside the house, altering the historical character of the building. Additionally, the structure was damaged in the 2023 Pazarcık earthquake, and its restoration process is currently ongoing, with plans for its future use as a museum. The transformation of the building has been evaluated based on design, participation, and usage criteria. The analyses emphasize the necessity of a holistic approach to the adaptive reuse process.

Key Words: *Historical Building, Adaptive Reuse, Osmaniye Salih Sefa Yazar Folklore House, Design, Utilization.*

Fisheries and Reproductive Biology of European pilchard (Sardina pilchardus (Walbaum, 1792)) in the Southwest of Marmara Sea

Yusuf ŞEN

Department of Marine Biology, Faculty of Marine Science and Technology, Çanakkale Onsekiz Mart University, Çanakkale, Türkiye

Abstract

European pilchard (*Sardina pilchardus* (Walbaum, 1792)) is one of the most important species in the ecosystem due to its ecological and economic importance. The stocks of this species generally tend to decrease over the years in the Marmara Sea. So, the fisheries and biology of European pilchard were analyzed monthly between January and December 2024 around the Southwest of Marmara Sea, Türkiye. It was determined that European pilchard was caught from commercial fishermen with purse seines using 8-10 mm mesh sizes from September 1st to April 15th and after April 15th with gillnets using 12, 12.5, 12.75, 13 mm mesh sizes in the Marmara Sea. Approximately 10 times more yield was caught per operation with purse seines than with gillnets. The total length and weight varied from 10.0 cm to 15.6 cm (mean:12.42±0.05 cm) and 5.98 g to 26.79 g (mean:13.46±0.18 g) in purse seine, and 10.7 cm to 15.1 cm (mean:12.49±0.05 cm) and 9.62 g to 21.58 g (mean:13.55±0.17 g) in gillnets. The 656 total individuals consisted of 243 females, 217 males, and 196 not dissected. The ratio of males to females was calculated as 1.0:1.12. The total length and weight of all individuals varied from 10.0 cm to 15.6 cm (mean:12.44±0.04 cm) and 5.98 g to 26.79 g (mean:13.48±0.13 g), respectively. The length-weight relationships were determined as $W=0.0091TL^{2.8849}$ in females ($R^2=0.82$), $W=0.0092TL^{2.883}$ ($R^2=0.82$) in males, $W=0.0094TL^{2.8723}$ ($R^2=0.82$) in all sexes. The negative allometric growth was found in females, males and all sexes. The first maturity length was determined as 12.76 cm for females, 11.96 cm for males. The gonadosomatic index value was maximum in February for females and males and minimum in August for females and June for males. The condition factor was maximum in August for females and November for males and minimum in May for females and March for males. The reproductive period of European pilchard takes place between November and April. Consequently, the fisheries and biology of European pilchard should be monitored for its sustainability.

Key Words: *Gillnet, Purse seine, Gonadosomatic index, First maturity length, Reproductive period*

Productivity, Water use efficiency, Soil properties of Sugarcane as influenced by trash mulching and weed management practices under dry season conditions in Nigeria

Moses Samuel Bassey[1*], and Emmanual Abraham Shittu[2]

[1]National Cereals Research Institute, Badeggi -, Nigeria
[2]Department of Agronomy, Bayero University, Kano - Nigeria
[*]Corresponding author email: ***mosessamuel36@yahoo.com***; Phon e no. +234 7038218171

Abstract

Productivity, Water use efficiency and Soil properties of Sugarcane were evaluated under dry season conditions. The treatments consisted of two sugarcane genotypes [Bida local and NCS 001], four cane trash mulch rates (0, 3, 6, 9 t ha^{-1}) and four weed management practices [weedy check, five monthly hoe weeding (5 MHW), pre-emergence (PE) application of diuron at 2 kg a.i ha^{-1} + post-emergence (POE) application of 3 – maize force at 179.2 g ha^{-1} (metolachlor 375 g L^{-1} + terbuthylazine 125 g L^{-1} + mesotrione 37.5 g L^{-1}+ 2 MHW, and PE diuron + POE 3-maize force] arranged as a split plot in a Randomized Complete Block Design and replicated three times. Weed management practices and trash mulching were allocated to the main plot, while sugarcane genotypes were the subplot. Reduction in water loss through evapotranspiration and retention of moisture content (41.9 %) was significant with application of 9 t ha^{-1} trash mulch. This invariably sustained the growth of sugarcane and reduced total crop failure during the dry seasons. The cane yield, considered as the most important character of sugarcane, was positively and significantly correlated with sprouting percentage (r=0.531**), number of tillers (r=0.574**), number of millable canes (r=0.716**), sugarcane stalk girth (r=0.595**) and height (r=0.677**), sugarcane brix (r=0.595**), organic carbon (r=0.568**), nitrogen (r=0.532**) and soil moisture content (r=0.531**) while Phosphorus (r=0.445), Potassium (r=0.397), showed positive but non-significant correlation with cane yield. Cane yield was negatively correlated with evapotranspiration (r= -0.500) and weed dry matter (r= -0.556) at all the stages. In order to manage weeds for sustainable growth and increased yield of sugarcane variety, NCS 001 should be used with PE diuron at 2.0 kg a.i ha^{-1} + POE 3-maize force at 2.0 kg a.i ha^{-1} in combination with 6- 9 t ha^{-1} of trash mulch.

Keywords: *Cane trash, Genotypes, Soil properties, Sugarcane, Weed management*

Microalgae as a Feed Source: Market Opportunities and Challenges for Future

Seyit Uguz[1]

[1]Bursa Uludag University, Faculty of Agriculture, Department of Biosystems Engineering, Bursa, Turkey
[2]Yozgat Bozok University, Faculty of Engineering and Architecture, Department of Biosystems Engineering, Yozgat, Turkey

Abstract

Microalgae are increasingly recognized as a valuable feed source, offering diverse applications in food, feed, and high-value products. Their high nutritional value, including proteins, lipids, carbohydrates, vitamins, and minerals, makes them an attractive and sustainable alternative for animal nutrition and aquaculture. Despite these advantages, challenges such as scalable production, economic viability, and regulatory frameworks must be addressed. Current research highlights the potential of microalgae as feed source to enhance animal health and performance, but further development in cultivation, harvesting techniques, and feed formulation for market opportunities and challenges. Optimizing the nutritional composition of microalgae for different species and production stages is crucial for their successful integration. Overcoming these challenges can revolutionize the animal feed industry, providing sustainable and nutrient-rich solutions.

Key Words: *Microalgae, animal feed, food, market*

Introduction

Microalgae have garnered significant attention as a valuable feed source due to their diverse applications in food, feed, and high-value products. These microscopic organisms offer a promising alternative for various industries, including animal nutrition and aquaculture. Studies have highlighted the nutritional benefits of microalgae, showcasing their potential as a sustainable and nutrient-rich feed supplement (Ricigliano, 2020; Yaakob et al., 2014; Souza et al., 2021). Microalgae are rich in proteins, carbohydrates, lipids, vitamins, minerals, and other organic compounds, making them a comprehensive source of essential nutrients for animal feed (Souza et al., 2021).

Despite the numerous advantages of microalgae as a feed source, challenges exist in their widespread adoption. Commercial production of microalgae for food and animal feed is still in its early stages, indicating a need for further research and development to optimize production processes (Dixit et al., 2021). Techno-economic assessments have shown that while microalgae hold potential as a sustainable biomass source, they currently face challenges in competing with market prices for biofuels, animal feed inputs, and bulk chemicals (Dixon & Wilken, 2018). However, with advancements in research and technology, the utilization of microalgae in animal nutrition, aquaculture, and other industries is expected to grow (Ma, 2023; Han et al., 2019).

In Europe, experts have identified significant market opportunities for microalgae, including the production of bioplastics, biofertilizers, nutraceuticals, pharmaceuticals, cosmetics, and biofuels (Rumin et al., 2020). The versatility of microalgae in providing valuable bioproducts and biofuels underscores their potential to contribute to sustainable energy resource development and reduce reliance on fossil fuels (Liber et al., 2020). Moreover, the high nutritional value, rapid growth rates, and low production costs of microalgae make them an attractive alternative to conventional feed sources like fishmeal, particularly in aquaculture (Maizatul et al., 2017).

Nutritional Value of Microalgae As a Feed Source

Microalgae have gained recognition as a valuable and sustainable feed source due to their high nutritional value and diverse applications in various industries, particularly in animal nutrition and aquaculture. These microscopic organisms offer a rich source of essential nutrients such as lipids, proteins, carbohydrates, amino acids, and fatty acids, making them a promising feed supplement for aquaculture-cultivated fish and shrimps (Yaakob et al., 2021). The nutritional content and easy digestibility of microalgae have positioned them as live feed options in the aquaculture industry, contributing to the growth and health of aquatic organisms (Amenorfenyo et al., 2019). Recent studies have demonstrated that microalgae can serve as a comparable protein feed to traditional sources like soya bean meal in livestock and poultry production, highlighting their potential as a sustainable alternative feedstock (Saadaoui et al., 2021).

Microalgae are known for their enriched nutritional profile, containing proteins, lipids, carbohydrates, vitamins, minerals, and antioxidants that are beneficial for animal health (Lopes et al., 2022; Uğuz and Sozcu, 2023, 2024).

The inclusion of microalgae in animal diets has shown improvements in feed utilization, milk production, growth performance, and meat quality in ruminants, underscoring their value as a feed ingredient (Kholif & Olafadehan, 2021). Additionally, microalgae offer essential amino acids, triglycerides, vitamins, and pigments that can enhance the nutritional quality of livestock feed formulations (Ahmad et al., 2022). The high crude protein concentrations and omega-3 fatty acids found in certain microalgae species make them attractive alternative feed resources for animals (Wild et al., 2018). Furthermore, microalgae have been explored as a sustainable source for human food, animal feed, and high-value products due to their high nutritional value and potential benefits since the 1950s (Sui & Vlaeminck, 2018). Their nutritional richness, including proteins, lipids, carbohydrates, and pigments, has positioned microalgae as valuable resources for enhancing the nutrition of food and animal feedstock (Aslam et al., 2017). Studies have also highlighted the benefits of microalgae in fish nutrition, showcasing their potential as a nutrition-rich ingredient for fish feed applications (Annamalai et al., 2021). The nutritional value of microalgae as a feed source is increasingly recognized for its potential to improve animal health, enhance feed formulations, and contribute to sustainable practices in animal nutrition and aquaculture. The diverse array of essential nutrients present in microalgae underscores their significance as a promising feed supplement with broad applications across various industries.

Global Market and Productıon Data of Mıcroalgae Based Feed

The global market for microalgae-based feed is experiencing significant growth and interest due to the nutritional benefits and sustainable nature of microalgae as a feed source. Research has highlighted the potential industrial applications and commercialization of microalgae in the functional food and feed industries, emphasizing the bioactive compounds present in microalgal biomass, such as proteins, polyunsaturated fatty acids, carotenoids, vitamins, and minerals (Camacho et al., 2019). These compounds play crucial roles in functional food and feed products, offering various health benefits, including antioxidant, anti-inflammatory, antimicrobial, and antiviral effects (Camacho et al., 2019).

Microalgae cultivation for feed production at an industrial scale has been demonstrated to be feasible and sustainable, creating opportunities for the utilization of microalgae as alternative feedstocks for livestock and poultry production (Saadaoui et al., 2021). The oil, protein, and antioxidant-rich microalgal biomass are commonly used as feed and food supplements in various forms such as pastes, powders, tablets, capsules, or flakes, designed for daily consumption (Kratzer & Murkovic, 2021). The high protein content of microalgae biomass makes it a valuable resource for aquafeed, animal feed, and poultry feed applications (Sarma et al., 2021).

In the realm of animal nutrition, microalgae have been explored as alternative feedstuffs for pig and poultry feeding, providing a potential substitute for conventional feedstuffs like corn and soybean (Chaves et al., 2021). The use of microalgae in monogastric feeds has shown promise in enhancing feed efficiency and modifying intermediary metabolisms in aquatic animals, underscoring their potential as functional feed additives (Perera et al., 2020). Additionally, microalgae species with high protein concentration and suitable amino acid composition can act as substitutes for conventional protein feeds, while species with high carbohydrate or lipid concentration can offer energy supplementation (Lamminen, 2021).

The global microalgae industry, particularly in China, significantly contributes to the production of microalgae biomass for various applications, with a substantial portion being utilized for human consumption as nutraceuticals and for animal feeds, primarily in marine aquaculture (Chen et al., 2015). The utilization of microalgae biomass as aquafeed is acknowledged as environmentally friendly and cost-effective, further propelling its adoption in the aquaculture sector (Annamalai et al., 2021). The global market for microalgae-based feed is rapidly expanding, driven by the nutritional value, sustainability, and diverse applications of microalgae in animal nutrition and aquaculture. The commercialization and industrial applications of microalgae in functional food and feed industries are paving the way for innovative and sustainable feed solutions that offer health benefits and environmental advantages.

Challenges for Future

The future market challenges of utilizing microalgae as animal feed present a complex landscape that requires addressing various factors to ensure successful integration and adoption. As highlighted in recent research, the potential of microalgae as a sustainable and nutrient-rich feed source is promising, offering benefits such as enhanced animal health, improved feed efficiency, and environmental sustainability (Lum et al. 2013; Aslam et al., 2017). However, several challenges need to be navigated to maximize the utilization of microalgae in animal nutrition.

One of the key challenges facing the future market of microalgae-based animal feed is the need for scalable production methods to meet the increasing demand for feedstock in the livestock and aquaculture industries (Ahmad et al., 2022). While microalgae cultivation has shown potential, there are limitations in scaling up production to commercial levels efficiently and cost-effectively. Addressing issues related to cultivation systems,

nutrient availability, and harvesting techniques is crucial to ensure a reliable and sustainable supply of microalgae biomass for animal feed applications (Ahmad et al., 2022; Hemaiswarya et al., 2010).

Moreover, the economic viability of incorporating microalgae into animal feed formulations poses a significant challenge for market adoption. The cost-effectiveness of producing and processing microalgae biomass for feed applications needs to be optimized to compete with traditional feed sources economically (Zakaria et al., 2020). Techno-economic assessments and research into efficient production methods are essential to overcome cost barriers and make microalgae-based feed competitive in the market (Zakaria et al., 2020; Ahmad et al., 2022).

Another critical aspect that requires attention is the regulatory framework surrounding the use of microalgae in animal feed. As the industry evolves, regulations governing the production, processing, and labeling of microalgae-based feed products need to be established and harmonized to ensure consumer safety and product quality (Novoveská et al., 2019). Clear guidelines and standards will be essential to build trust in microalgae-based feed products and facilitate market acceptance (Novoveská et al., 2019).

Furthermore, research and development efforts are needed to optimize the nutritional composition of microalgae for specific animal species and production stages. Tailoring microalgae strains to meet the dietary requirements of different livestock and aquaculture species can enhance the efficacy of microalgae-based feed formulations and improve animal performance (Cabrita et al., 2022). Understanding the nutritional value and anti-nutritional factors of microalgae species is crucial for formulating balanced and effective feed products (Chen et al., 2022).

Conclusion

In conclusion, while the potential of microalgae as a feed source for animals is promising, addressing challenges related to production scalability, cost-effectiveness, regulatory frameworks, and nutritional optimization is essential for the future market success of microalgae-based animal feed. Its high protein content makes it a valuable resource for animal feed, emphasizing its versatility and nutritional benefits. However, to fully realize these opportunities, several challenges must be addressed:

- Scaling Production: Efficient and cost-effective production methods, along with advancements in cultivation and harvesting, are essential to meet the increasing demand in the livestock and aquaculture industries.
- Economic Viability: Optimizing the economic viability of microalgae-based feed to compete with traditional feed sources is crucial.
- Regulatory Frameworks: Establishing clear regulatory guidelines for production, processing, and labeling is necessary to ensure consumer safety and product quality, thereby building trust and facilitating market acceptance.
- Nutritional Optimization: Research is needed to optimize the nutritional composition of microalgae for different animal species and production stages to enhance feed efficacy and improve animal performance.
- In conclusion, addressing these challenges is essential for the successful integration of microalgae-based feed in animal nutrition. By overcoming these hurdles, microalgae has the potential to revolutionize the animal feed industry, providing sustainable and nutrient-rich solutions for enhanced animal health and performance.

Abstract

Bu çalışmada, ticari çeşitlerin ve ıslah hatlarının bulunduğu toplam 168 patates genotipinin moleküler karakterizasyonları yapılmış ve genetik çeşitlilikleri belirlenmiştir. Bu amaçla 10 SSR markörü kullanarak, kapiler elektroforez yöntemiyle genotipleme yapılmış ve Nei genetik mesafe yöntemine göre popülasyon içerisindeki genetik çeşitlilik incelenmiştir. Yapılan genotipleme sonucunda, 10 SSR markörü 168 patates genotipinde toplam 48 skorlanabilir bant oluşturmuştur. Elde edilen 48 banttan 47'si polimorfizm göstermiştir. Kullanılan her bir markörün polimorfik bant sayısı 1 ile 9 arasında değişmiş, ortalama polimorfik bant sayısı 4,7 olarak hesaplanmıştır. Toplam 10 SSR markörünün ortalama polimorfizm oranı ise %95 olarak gerçekleşmiştir. Markörlerin polimorfizm bilgi içeriği (PIC) değeri 0,08 ile 0,42 arasında değişmiş ve ortalama PIC değeri ise 0,28 olarak hesaplanmıştır. İncelenen genotipler içerisinde genetik olarak bir birinden en uzak olanlar, 0,7802 genetik mesafe değerine sahip olan PAE 15-7-19 ile Tiger, PAE 15-6-11 ile Kafkas, PAE 15-7-22 ile Yaprak, PAE 15-7-22 ile Aydos, PAE 15-7-22 ile Yankı, Innovator ile PAE 15-5-8, Nam ile Bettina, Guzine ile PAE 15-5-8 ve Julinka ile Innovator'dür. Birbirine en yakın genotipler 0,0645 genetik mesafe değerine sahip olan Leventbey ile Muratbey ve Bergerac ile Highland B. Red'dir.

Anahtar Kelimeler: *Patates (Solanum tuberosum L.), genetik çeşitlilik, moleküler karakterizasyon, basit dizi tekrarları (SSR)*

Effects of Different Nitrogen Doses on Quality Criteria of Bread Wheat Varieties

Leyla İdikut[1*], Elif Evcimen[1]

[1]Kahramanmaraş Sütçü İmam Üniversitesi, Ziraat Fakültesi, Tarla Bitkileri Bölümü, Kahramanmaraş, Türkiye

Abstract

Different nitrogen (0, 4, 8, 12, 16 and 20 kg da-1) fertilizer doses were applied to Pehlivan and Bezostaja-1 bread varieties in a split plot experimental design under Elazığ climate conditions in the 2020-2021 wheat growing season. The aim of the study was to investigate the effects of nitrogen fertilizer doses on grain quality characteristics of bread wheat varieties. In the research, grain quality characteristics such as thousand grain weight, protein, starch, ash, oil, moisture, gluten and fiber ratios of bread wheat varieties were examined. In the study, the differences between the varieties in terms of thousand grain weight and ash content were found to be statistically significant. Other examined characteristics did not create statistical differences among bread wheat varieties. While the Bezostaja-1 variety had a higher value than the Pehlivan variety in thousand grain weight, it was determined that the Pehlivan variety had a higher value in ash ratio. It was determined that the differences between the varieties were not significant in terms of other characteristics examined. The different nitrogen doses applied had a statistically significant positive effect on all the characteristics examined except oil ratio. Among the examined traits, higher values were obtained in 20 kg da-1 nitrogen application for thousand grain weight, ash ratio, moisture ratio values. In terms of protein ratio, starch ratio, gluten ratio and fiber ratio, 16 kg da-1 nitrogen application was considered to be statistically more suitable.

***Key words**: bread wheat, nitrogen doses, quality criteria, thousand grain weight, protein content*

Farklı Azot Dozların Ekmeklik Buğday Çeşitlerinin Kalite Kriterlerine Etkileri

Özet

Farklı azot (0, 4, 8, 12, 16 ve 20 kg da^{-1}) gübre dozları Pehlivan ve Bezostaja-1 ekmeklik çeşitlerine uygulayarak 2020-2021 yılarında buğday yetiştirme sezonunda Elazığ iklim koşullarında bölünmüş parseller deneme deseninde yürütülmüştür. Çalışmada ekmeklik buğday çeşitlerinin tane kalite özeliklerine azot gübre dozlarının etkisinin araştırılması amaçlanmıştır. Araştırmada ekmeklik buğday çeşitlerinin bin tane ağırlığı, protein, nişasta, kül, yağ, nem, glüten ve lif oranlarını gibi tane kalite özellikleri incelenmiştir. Araştırmada incelenen özelliklerden bin tane ağırlığı ve kül oranı yönünden çeşitler arasındaki farklılıklar istatiksel olarak önemli bulunmuştur. İncelenen diğer özellikler ekmeklik buğday çeşitleri arasında istatistiksel farklılıklar oluşturmamıştır. Bin tane ağırlığında Bezostaja-1 çeşidi Pehlivan çeşidinden daha yüksek değere sahip olurken, kül oranında Pehlivan çeşidinin daha yüksek değere sahip olduğu tespit edilmiştir. İncelenen diğer özelikler yönünden çeşitler arasında farklılıkların önemli olmadığı belirlenmiştir. Uygulanan farklı azot dozları incelenen özelliklerden yağ oranı hariç diğer özellikler üzerinde pozitif yönde istatistiksel olarak önemli etkide bulunmuştur. İncelenen özelliklerden bin tane ağırlığı, kül oranı, nem oranı değerleri için 20 kg da^{-1} azot uygulamasında daha yüksek değerler elde edilmiştir. Protein oranı, nişasta oranı, glüten oranı ve lif oranı yönünden 16 kg da-1 azot uygulamasının istatiksel olarak daha uygun olduğu düşünülmüştür.

***Anahtar kelimeler:** ekmeklik buğday, azot dozları, kalite kriterleri, bin tane ağırlığı, protein oranı*

Giriş

Beslenme sorununun çözümü insanlığın hayat mücadelesi olmuştur, önceleri doğada bulduğuyla yetinen insan, sonraları toplayıcılık ve yetiştiricilikle gıda teminini sürdürmüştür. Yerleşik düzene geçilmesiyle bitki yetiştiriciliği yaygınlaşmaya başlamıştır. Her geçen günde bitki yetiştiriciliğindeki yeni teknikler ve uygulamalar verim artışa fırsat yaratmıştır. Dünya üzerinde en fazla ekim alanına sahip olan buğday bitkisi üzerinde yapılan araştırmalarda da süreklilik arz etmektedir. Buğday, dünyada üretim ve tüketim yönünden birinciliğini korumaya devam etmekte ve gelecekte de önceliğini devam ettireceği öngörülmektedir. Tüketici, fırıncı, değirmenci ve üretici buğdayı kullanan zincirin halkasını oluşturmaktadır. Bir buğday tanesi yaklaşık olarak %8-15 oranında protein, %65-75 oranında nişasta, %1.5 oranında yağ, %1-1.5 oranında şeker ve %1-2 oranında kül içermektedir. Tanenin barındırdığı protein, karbonhidrat ve yağ dışında önemli vitaminler de bulunmaktadır (Kün, 1988). Buğday bitkisi kalite kriterlerine göre ekmeklik ve makarnalık olarak gruplandırılmaktadır (Bilgiçli ve Soylu, 2016). Ekmeklik, makarnalık ve bisküvi için üretilen buğdayın özellikleri birbirinden farklı olmaktadır. Ekmeklik

buğdayda kaliteye etki eden en önemli faktör glüten miktarı ve protein oranıdır. Buğdayda kaliteyi belirleyen teknolojik, kimyasal ve fiziksel özellikler üzerinde toprak ve iklim gibi çevre şartları önemli rol oynamaktadır (Dick ve ark. 2016)). Bu sebepten ötürü, yeni geliştirilen çeşit veya hatların kalitesinin tam anlamıyla değerlendirme sağlayabilmesi için farklı çevrelerde yetiştirilmesi gerekmektedir (Karaman ve ark., 2012). Buğdayda kalite kriterleri ekolojik çevre, iklim, toprak özellikleri, sulama, gübreleme gibi uygulamalara etkileşim içindedir (Sobolewska ve ark., 2020). Tüm bitki yetiştiriciliğinde olduğu gibi buğday bitkisi için gübreme verim ve kaliteyi artırıcı bir elementtir. Buğdayda yaprak püskürtme yoluyla azot uygulaması, unların protein içeriğini ve ekmek yapma özelliklerini iyileştirmek için en etkili tarımsal araçlardan biri olarak kabul edilir. Ancak, buğdayın tepkisi gübre formuna, konsantrasyonuna, uygulama sıklığına, büyümeye aşamasına, yaprak yaşı, ayrıca diğer morfolojik ve fizyolojik özellikler bağlıdır (Arif ve ark., 2006; Dick ve ark., 2016). Gübreleme, son yıllarda emtia fiyatlarındaki dramatik artışların ardından, ürün yönetimindeki en pahalı girdilerden biri haline gelmiştir. Buna karşılık, günümüzde ürün yetiştirme sistemleri hem çiftçiler hem de tüm toplum için ekonomik ve çevresel olarak sürdürülebilir olmalıdır. Azot bitki üretimine, çevre ve ekolojiye önemli katkıda bulunmaktadır (Zhang ve ark., 2015). Azot gübresinin orantısız ve zamansız kullanımı sonucunda, düşük N alım, N sızıntısı ve denitrifikasyon oluşmaktadır (Miao ve ark., 2011; Mohsin ve ark., 2012; Wang ve ark., 2022). Topraktaki fazla miktardaki azot kalıntısının yağışla toprak asitlenmesine ve yeraltı suyunun bozulmasına neden olmaktadır (Lu ve ark., 2015). Ayrıca aşırı N gübresi bitki metabolizmasını da etkileyerek nitrat ve nitrit birikmesi sonucunda potansiyel olarak insanlarda zarar oluşturmaktadır (Galloway ve ark., 2008). Bu çalışmada, 0, 4, 8, 12, 16, 20 kg da $^{-1}$ azot dozları Pehlivan ve Bezostaja-1 ekmeklik buğday çeşitlerine Elazığ koşullarında uygulanarak, azot dozlarının kalite özelliklerine etkisinin araştırılması amaçlanmıştır. Araştırma sonucunda elde edilen sonuçlar bölgede buğday tarımı yapan üreticiye katkı sağlaması yönünden önemlidir

Materyal ve Metot

Yürütülen araştırmada Bezostaja-1 ve Pehlivan çeşitler kullanılmıştır. Uygulama faktörü olarak azotun (üre) 0, 4, 8, 12, 16, 20 kg da^{-1} dozları kullanılmıştır. Toprak hazırlığından hemen sonrasında ekimle birlikte 5 kg da^{-1} saf triple süper fosfor gübresi ve azot dozlarının yarısı toprağa karıştırılmıştır. Azot dozunun diğer yarısı bitkinin sapa kalma döneminde uygulanmıştır. Araştırma Elazığ ilinin bağlı Sarılı köyünde 2020 Kasım-2021-Temmuz ayları arasında yürütülmüştür. Tesadüf blokları deneme deseninde 4 tekerrürlü olarak, ana parselde çeşitler alt parselde gübre dozları uygulanmıştır. Tohum ekimleri 20 cm sıra arası mesafesinde 6 sıra ve 3 metre uzunluğunda kurulmuştur. Ekim 31 Ekim 2020 tarihinde elle yapılmıştır. Araştırmanın yürütüldüğü aylara ait bazı iklim özellikleri Çizelge 1. verilmiştir.

Çizelge 1. Denemenin yürütüldüğü dönemde Elazığ iline ait bazı iklim verileri

Aylar	Yıllar	Sıcaklık (C^0)			Ortalama nisbi Nem (%)	Yağış (mm)
		Min.	Max.	Ort.		
Kasım	2020	-3.4	23.2	8.3	66.8	28.8
Aralık	2020	-7.0	12.5	3.7	78.3	16.6
Ocak	2021	-12.1	12.0	1.1	79.2	10.3
Şubat	2021	-9.7	16.8	5.0	59.5	1.0
Mart	2021	-5.9	18.2	6.7	57.4	13.5
Nisan	2021	-1.0	31.1	15.0	44.3	1.8
Mayıs	2021	3.0	36.3	21.1	29.5	1.6
Haziran	2021	10.3	37.3	24.5	26.7	1.7
Temmuz	2021	17.3	42.1	28.9	23.9	0.3

(Anonim, 2024)

Çalışmanın yürütüldüğü Elazığ ili Doğu Anadolu Bölgesi'nin güneybatısında bulunmaktadır. Bölgenin diğer illere göre farklı bir iklim özelliğine sahiptir. Kışlar ise soğuk ve yağışlı, yazlar sıcak ve kurak, karasal iklim görülmektedir. Denemenin yürütüldüğü yetiştirilme sezonunda Kasım ayından Nisan ayına kadar ortalama minimum sıcakların sıfırın alta sürdüğü, Nisan ayından itibaren buğday bitkilerinde gelişmenin başlayabileceği Çizelge 1 anlaşılmaktadır. Nisan ayından itibaren yağış ve nispi nemin çok düşük olduğu görülmektedir. Deneme alanının 0-20 cm derinliğindeki toprak özellikleri; organik madde %1.40, fosfor miktarı 11.47 (kg/da), potasyum miktarı 93.33 (kg/da), kireç oranı %12.20, ve Ph değerinin 7.80 olarak kaydedilmiştir (Anonim, 2019). Araştırmada ekmeklik buğday çeşitlerinin bin tane ağırlığı, protein, nişasta, kül, yan, nem, glüten ve lif oranlarını kapsayan özellikleri incelenmiştir.
İncelenen özeliklere ait veriler JUMP paket programında, bölünmüş parseller deneme planına göre varyans analizi yapılmıştır. Elde edilen ortalamaların karşılaştırılmasında Duncan çoklu karşılaştırma testi uygulanmıştır.

Bulgular ve Tartışma

Elazığ koşullarında iki ekmeklik buğday çeşidine farklı gübre dozları uygulanarak yürütülen çalışma bin tane ağırlığı, protein oranı, nişasta oranına ait elde edilen veriler Çizelge 2'de verilmiştir.

Çizelge 2. Ekmeklik buğday çeşitlerinin farklı azot doz uygulamalarında elde edilen bin tane ağırlığına, protein oranına, nişasta oranına ait ortamalar ve grupları

	Bin tane oranı			Protein oranı			Nişasta oranı		
Gübre dozları	Pehlivan	Bezostaja-1	ortalamalar	Pehlivan	Bezostaja-1	Orta.	Pehlivan	Bezostaja-1	Orta.
0	29.22	32.40	30.81 e	9.67	10.66	10.17 d	58.90	60.20	59.55 d
4	30.68	33.86	32.27 d	13.00	12.45	12.72 c	60.61	62.22	61.41 c
8	31.95	34.76	33.36 c	13.23	13.06	13.15 bc	61.21	62.29	61.75 bc
12	32.70	35.45	34.07 c	14.23	13.80	14.01 ab	61.73	62.47	62.10 bc
16	33.87	36.31	35.09 b	14.71	13.92	14.31 a	64.27	64.68	64.48 a
20	34.67	39.28	36.97 a	15.00	14.13	14.57 a	63.09	63.07	63.08 a
Orta.	32.18 b	35.34 a	33.76	13.31	13.00	13.15	61.64	62.48	62.08

Elazığ koşullarında ekmeklik çeşitlerine farklı azot doz uygulanarak yürütülen çalışmada çeşitlerin istatistiki olarak önemli farklılıklar oluşturduğu kaydedilmiştir. Bezostaja-1 çeşidinde 35.34 g bin tane ağırlığı ile Pehlivan çeşidinden(32.18 g) daha yüksek değere sahip olduğu ve istatiksel olarak farklı grupta yer aldığı kaydedilmiştir. Bin tane ağırlığı yönünden uygulanan 6 farklı azot dozları istatistiksel olarak birbirinden farklı beş grup oluşturmuştur. Bin tane ağırlığı en yüksek 36.97 g ile 20 kg da^{-1} azot doz uygulamasından, en düşük 30.81 g ile 0 kg da^{-1} azot uygulamasından elde edildiği ve farklı gruplarda yer aldığı, diğer uygulamalardan da istatiksel olarak önemli farklılıklar oluşturduğu kaydedilmiştir. Azot doz uygulamasında 8 ve 12 kg da^{-1} uygulamaları sırasıyla 33.36 ve 34.07 g bin tane ağırlıkları ile kendi aralarında istatiksel farklılık oluşturmayıp, diğer uygulamalara arasında farklılıklar oluşturmuştur. Bin tane ağırlığı yönünden çeşit x azot doz interaksiyonu önemsiz bulunmuştur. Çeşit x azot doz interaksiyonunda, en düşük değer 29.22 g ile Pehlivan çeşidinin 0 kg da^{1} azot doz uygulamasında, en yüksek değer ise 39.28 g ile Bezostaja-1 çeşidinin 20 kg azot uygulamasından elde edilmiştir. Diğer çeşit x azot doz interaksiyonlarında bin tane ağırlığı 30.381-36.312 kg arasında değişen değerler göstermiştir (Çizelge 2). Ottman ark. (2000) ABD yapmış olduğu çalışmada çiçeklenmeye yakın azot uygulamanın bin tane ağırlığını sadece birinci yıl arttırdığını, ikinci yılda ise etkilemediğini, Tümsavaş (2001) azotun uygulama zamanının verim unsurları üzerine etkisi olmadığı, farklı azot dozlarının ise verim unsurları üzerinde etkili olduğu, Kaplan (2003) 24 kg dekar azot uygulama zamanının bin tane ağırlığı üzerine etkisinin önemli olduğu bildirmişlerdir. Korkut ve ark (2006) Tekirdağ ekolojik şartlarında bin tane ağırlığının 37.4-50.9 g, Çöl (2007) Konya kuru koşullarında bin tane ağırlığının 26.7-32 g, Mutvali ve ark (2016) Sudan ekolojik 1000 tane ağırlığının 28,7-48,5 g arasında ve özelliklerin bölgeden bölgeye göre değiştiğini, Aksu (2017) buğday çeşitlerine farklı oranlarda gübre dozu uygulamasında bin tane ağılığının 42.23-46.40 g arasında, uygulanan 21 kg da^{-1} azotlu gübre dozunun buğday bitkisine kalite ve verim özellikleri üzerinde olumlu etki ettiğini, Araç ve Topal (2019) Konya ekolojik şartlarında Bezostaja-1 buğday çeşidinin bin tane ağırlığının 53.84 g, Kubar ve ark (2020) Çin'de beş farklı azot dozunun farklı zamanlarda yapılan uygulamalarda bin tane ağırlığının 19-43 g, Zheng ve ark(2021) Çin'de iki buğday, bin tane ağırlığının 35-38 g, olduğunu bildirmişlerdir. Zhao ve ark. (2023) azot kullanım arttırılmasının, buğday ıslahında dengeli ve yüksek verim ve kaliteye ulaşmak için en etkili yöntemlerden birinin olduğunu söylemişlerdir. Buğday ile ilgili yapılan araştırmalarda, farklı genotiplerin kullanılan azot kullanım etkinliğinin, tane ağırlığında önemli olduğu bildirmişlerdir. Daha önceki araştırmalardan da anlaşıldığı gibi azot dozunun uygulama zamanına, ekolojiye çeşit göre farklılıklar göstereceği belirtilmektedir.

Ekmeklik buğday çeşitleri ile yürütüle çalışmada protein oranı yönünden çeşitler arasında istatistiki önemli farklılık görülmemiştir. Bezostaja-1 ekmeklik buğday çeşidi % 13.00 ve Pehlivan çeşidinin de %13.31 protein oranı sahip olduğu belirlenmiştir. Uygulanan farklı azot dozlarına göre protein oranları yönünden birbirinden farklı istatiksel olarak üç grup ve iki geçiş grubu oluşturmuştur. Protein oranı en yüksek 20 kg da^{-1} azot uygulamasında % 14.57 olduğu, onu ikinci sırada % 14.31 oranıyla takip eden 16 kg da^{-1} azot doz uygulamanın, üçüncü sırada 12 kg da^{-1} uygulamasının % 14.01 ile geçiş grubuyla izlediği ve kendi aralarında istatiksel olarak önemli farklılıklar oluşturmadığı kaydedilmiştir. En düşük protein oranı % 10.17 ile kontrol uygulamasından elde edildiği ve diğer azot doz uygulamalarından istatiksel önemli derecede farklılık olduğu belirlenmiştir. Onu ikinci sırada 4 kg da azot uygulamasının %12.72 protein oranıyla izlediği, geçiş grubunda yer alan 8 kg da^{-1} azot uygulaması hariç diğer azot doz uygulamalarından istatiksel olarak önemli farklılıklar oluşturduğu kaydedilmiştir. Protein oranı yönünden çeşit x azot doz interaksiyonu önemsiz bulunmuştur. Çeşit x azot doz interaksiyonunda, en yüksek protein oranı % 15.00 ile Pehlivan 20 kg da^{1} uygulamasında, en düşük değer ise % 9.67 ile Pehlivan çeşidinin 0 kg da^{1} azot uygulamasından elde edilmiştir. Diğer çeşit x azot doz interaksiyonlarında protein oranı % 10.660 – 14.715 arasında değişen değerler göstermiştir (Çizelge 2.). Yürütülen önceki çalışmalarda Ottman ark. (2000) ABD yapmış olduğu çalışmada çiçeklenmeye yakın azot uygulamanın tanedeki protein oranını arttırdığı sadece birinci

yıl arttırdığını, ikinci yılda ise etkilemediğini vurgulamıştır. Soylu ve Sade (2006) iki yıllık makarnalık buğdayla yaptıkları çalışmada, kontrol uygulamalarında protein oranlarının yıllara göre %10.37 ve %11.11, azottun 20 kg da^{-1} uygulamasında protein oranının %13.94 ve %14.73 olduğu, azotun tamamının ekimde uygulanmış olan parsellerde %11.82 ve %12.67, azotun üç parça şeklinde uygulanmış parsellerde %12.68 ve % 13.52 olduğunu belirtmişlerdir. Protein oranının Yağdı (2004) % 11.85-13.44, Aydın ark. (2007) % 12.4-13.3, Menderis (2006) % 12.49-14.92, arasında değişim gösterdiğini bildirmişlerdir. Çağlar ve ark (2006) 25 farklı ekmeklik buğdayın Erzurum ekolojisine protein oranının ise %11.2-13.5, Çöl (2007) Konya kuru koşullarında protein oranının %8.7-11.6, Korkut ve ark (2006) Tekirdağ ekolojik şartlarında protein içeriğinin %11.9-%13.7, Tunca (2012) ülkemizde yaygın yetiştirilen 16 kışlık ekmeklik buğday çeşidinin protein oranının %9.7-13.9 arasında değişim gösterdiği açıklamıştır. Mutwali ve ark (2016) Sudan ekolojisine yürüttükleri çalışmada protein oranını %9,96-14,06 olduğu, genotipler ve lokasyonlar arasında önemli farklılıkların olduğu, özelliklerin bölgeden bölgeye göre değiştiği, Aksu (2017) buğday çeşitlerine farklı oranlarda gübre dozu uygulamasında protein oranının %11.43-15.80 olduğu, 21 kg da^{-1} azotlu gübre dozunun buğday bitkisinin kalite ve verim özellikleri üzerinde olumlu etkide bulunduğunu bildirmişlerdir. Zhao ve ark. (2023) azot kullanım arttırılmasının, buğday ıslahında dengeli ve yüksek verim ve kaliteye ulaşmak için en etkili yöntemlerden birinin olduğunu ifade etmişlerdir. Daha önceki buğday ile ilgili yapılan araştırmalarda, farklı genotiplerin azot kullanım etkinliğinin, farklı çevreye ve kullanılan faktörlere göre değiştiği ve tane protein oranında etkili olduğunu belirtmişlerdir.

İncelenen özelliklerden nişasta oranın ekmeklik buğday çeşitleri arasında istatistiki farklılığın olmadığı kaydedilmiştir. Pehlivan çeşidinde % 61.64, Bezostaja-1 çeşidinde % 62.48 nişasta oranı tespit edilmiştir. Farklı azot uygulamaları nişasta oranını yönünden birbirinden farklı üç (a, c, d) ve birde (bc,) geçiş grubu oluşturmuştur. Araştırmada kullanılan ekmeklik buğday tanelerinde en yüksek nişasta oranı % 64.48 ile 16 kg da^{-1} azot doz uygulamasından elde edildiği, onu ikinci sırada izleyen %63.08 ile 20 kg da^{-1} azot uygulaması hariç ve diğer uygulamalardan istatiksel olarak önemli derecede farklılık oluşturduğu görülmüştür. En az nişasta oranı % 59.55 ile 0 kg da^{-1} azot doz uygulamasından elde edildiği ve diğer uygulamalardan istatiksel olarak önemli derecede farklılık oluşturduğu kaydedilmiştir. Onu ikinci sırada %61.41 nişasta oranıyla izleyen 4 kg da^{-1} azot uygulamasının, 8 ve 12 kg da^{-1} azot dozları uygulamaları haricinde diğer uygulamalardan istatiksel olarak önemli derecede farklılık oluşturduğu tespit edilmiştir. Çeşit x azot doz uygulama interaksiyonlarında nişasta oranı en yüksek % 64.682 ile Bezostaja çeşidinde 16 kg da^{-1} azot uygulamasından, en düşük nişasta oranı % 58.90 ile Pehlivan çeşidinin kontrol uygulamasında kaydedilmiştir. Değer intereaksiyon uygulamalarında nişasta oranı %60.61-64.27 arasında değişim göstermiştir (Çizelge 2.). Yaraşır (2018) Buğday bitkisine uygulanan beş farklı dozlarda (0, 1, 2, 3, 4 t da^{-1}) sıvı biyogaz atıkları ile üç farklı (0, 9, 18 kg da^{-1}) mineral azot dozu etkisinin incelendiği çalışmada nişasta oranını % 51.03 - 56.90 arasında değiştiğini belirtmiştir. Kubar ve ark. (2021), Çin'de buğday bitkisine 7.5, 15, 22.5 30 kg da-1 azot gübre uygulamasında, buğdayın kalite kriterlerine yalnızca N oranından değil aynı zamanda N uygulama zamanlarının da etkili olduğu belirtilmiştir. Yürütülen araştırmada da nişasta oranını azat dozlarının etkilediği görülmüştür. Genetiğe ek olarak, çevresel faktörler buğday verimi ve bileşimiyle ilgili değişkenliğin yaklaşık üçte ikisine katkıda bulunmaktadır (Hellemans ve ark., 2018)

Ekmeklik buğday çeşitlerinin farklı azot doz uygulamalarında elde edilen kül, yağ nem oranlarına ait ortamalar ve grupları Çizelge 3 verilmektedir.

Çizelge 3. Ekmeklik buğday çeşitlerinin farklı azot doz uygulamalarında elde edilen kül, yağ nem oranlarına ait ortamalar ve grupları

	Kül oranı			Yağ oranı			Nem oranı		
Gübre dozları	Pehlivan	Bezostaja-1	Ortalamalar	Pehlivan	Bezostaja-1	Orta.	Pehlivan	Bezostaja-1	Orta.
0	0.81	0.55	0.68 e	1.00	0.90	0.95	8.35	8.15	8.25 d
4	1.06	0.64	0.85 d	1.13	0.90	1.01	8.42	8.30	8.36 cd
8	1.27	1.03	1.15 c	1.19	1.03	1.11	8.53	8.39	8.46 bc
12	1.35	1.21	1.28 bc	1.20	1.04	1.12	8.48	8.42	8.45 bc
16	1.45	1.24	1.35 bc	1.20	1.14	1.17	8.56	8.47	8.51 b
20	1.57	1.29	1.43 a	1.24	1.18	1.21	8.72	8.61	8.66 a
Orta.	1.25 a	0.99 b	1.12	1.16	1.03	1.09	8.51	8.39	8.45

Araştırmada kullanılan iki ekmeklik buğday çeşidinin kül oranının önemli farklılıklar oluşturduğu ve iki grup oluştuğu gözlemlenmiştir. Ekmeklik buğday çeşitlerinin kül oranları Pehlivan çeşidinde % 1.25, Bezostaja-1 çeşidinde % 0.99 olduğu ve istatistiki olarak farklı grupta yer aldığı Çizelge 4.3'de görülmektedir. Farklı azot uygulamalarında ekmeklik buğday çeşitlerinin kül oranının % 0.68 - 1.43 arasında değişim gösterdiği ve kendi aralarından birbirinden farklı 4 grup ve birde geçiş grubu oluşturduğu kaydedilmiştir. En yüksek kül oranı % 1.43 ile 20 kg da^{1} azot dozunda elde edildiği ve diğer azot dozları uygulamalarından istatiksel olarak önemli farklılık oluşturduğu kaydedilmiştir. En düşük kül oranı % 0.68 ile 0 kg da^{-1} azot dozunda elde edilmiş ve diğerlerinden istatiksel olarak önemli farklılık oluşturduğu tespit edilmiştir. Azot doz uygulamasında 12 ve 16 kg da^{-1} uygulamasında kül oranları sırasıyla % 1.28, 1.35 değerleriyle aynı geçiş grubunda yer aldığı 8 kg da^{-1} azot doz

uygulaması hariç diğer azot dozları uygulamalarından istatiksel olarak farklılıklar oluşturduğu belirlenmiştir. Çeşit azat doz uygulama interaksiyonlarında ise kül oranı en yüksek % 1.57 ile Pehlivan çeşidinin 20 kg/da^{1} azot dozu uygulamasından, en düşük kül oranı % 0.552 ile Bezostaja-1 çeşidinin kontrol uygulamasından elde edilmiştir. Diğer interaksiyon uygulamalarında kül oranlarının % 1.457 -0.645 arasında değişim gösterdiği kaydedilmiştir (Çizelge 3.). Ünal (2003), buğdayda un ve kalitesinin belirlenmesi amacıyla yapmış olduğu çalışma sonucunda; unun barındırmış olduğu inorganik maddeler 'kül' olarak adlandırılmaktadır. Bu inorganik maddeler buğdayın kabuğunda %12-20 oranında olduğu sonucunu bildirmiştir. Yaraşır (2018) Buğday bitkisine uygulanan beş farklı dozlarda (0, 1, 2, 3, 4 t da^{-1}) sıvı biyogaz atıkları ile üç farklı (0, 9, 18 kg da^{-1}) mineral azot dozu etkisinin incelendiği çalışmada kül oranları % 1.22 - 1.51 arasında değiştiğini belirtmiştir.

Yürütülen çalışmada incelenen özelliklerden yağ oranı Pehlivan çeşidinde %1.161, Bezostaja-1 çeşidinde % 1.035, olduğu ve istatistiksel farklılığın oluşmadığı tespit edilmiştir. Uygulanan azot dozlarının incelenen yağ oranı üzerinde istatistiki olarak önemli farklılık oluşturmadığı görülmüştür. Farklı azot uygulamalarında en yüksek yağ oranı % 1.21 ile 20 kg da^{-1} azot dozundan, en düşük yağ oranı % 0.95 ile 0 kg da^{-1} azot doz uygulamasından elde edildiği kaydedilmiştir. Diğer azot doz uygulamalarında yağ oranı % 1.01 - 1.17 arasında değişim göstermiştir. Çeşit x azot doz uygulama interaksiyonlarında yağ oranı en yüksek% 1.24 ile Pehlivan çeşidinin 20 kg da^{1} azot dozu uygulamasında, en düşük % 0.90 ile Bezostaja-1 çeşidinin kontrol uygulamasında gerçekleştiği belirlenmiştir. Diğer interaksiyon uygulamalarında yağ oranlarının % 1.20-1.0 arasında değişim gösterdiği tespit edilmiştir (Çizelge 3.). Yaraşır (2018) Buğday bitkisine uygulanan beş farklı dozlarda (0, 1, 2, 3, 4 t da^{-1}) sıvı biyogaz atıkları ile üç farklı (0, 9, 18 kg da^{-1}) mineral azot dozu etkisinin incelendiği çalışmada yağ oranları % 1.94 -2.35 arasında değiştiğini tespit etmiştir. Kubar ve ark. (2021), Çin'de buday bitkisine 7.5, 15, 22.5 30 kg da-1 azot gübre uygulamasında, buğdayın kalite kriterlerine yalnızca N oranından değil aynı zamanda N uygulama zamanlarının da etkili olduğu belirtilmiştir.

Araştırmada incelenen özelliklerden nem oranının iki ekmeklik buğday çeşitleri arasında istatiksel farklılıkların oluşturmadığı, Pehlivan çeşidinin % 8.72 Bezostaja-1 çeşidinin % 8.61 nem oranına sahip olduğu gözlemlenmiştir. Farklı azot uygulamaları nem oranlarına göre istatiksel olarak üç grup ve ikide geçiş grubu oluşturduğu belirlenmiştir. En yüksek nem oranı % 8.66 ile 20 kg da^{-1} azot doz uygulamasında elde edildiği ve diğer azot doz uygulamalarından istatiksel olarak önemli farklılıklar oluşturduğu kaydedilmiştir. En düşük nem oranı % 8.25 ile kontrol uygulamasından elde edildiği, onu ikinci sırada % 8.36 ile 4 kg da^{-1} azot doz uygulaması hariç diğer azot doz uygulamalarından istatiksel olarak önemli farklılıklar oluşturduğu belirlenmiştir. Azot doz uygulamalarından 8 ve 12 kg da^{-1} uygulaması nem oranı yönünden aynı geçiş grubunda yer aldığı, 4 ve 16 kg da^{-1} doz uygulaması hariç diğer uygulamalardan istatistiki olarak önemli farklılık oluşturduğu tespit edilmiştir. Çeşit x azot doz uygulama interaksiyonlarında nem oranı en yüksek % 8.72 ile Pehlivan çeşidinde 20 kg da^{1} azot dozu uygulamasından, en düşük nem % 8.15 ile Bezostaja çeşidinden elde edilmiştir. Diğer interaksiyonlarda ise nem değerleri % 8.30 – 8.61 arasında değişim gösterdiği ve istatistiksek farklılıkların oluşmadığı kaydedilmiştir (Çizelge 3.). Ünal (2003) ülkemizde yetiştirilen ekmeklik buğday çeşitlerinin nem içeriklerinin % 8-14 arasında, ortalama % 9-11 oranında olduğunu belirtmiştir. Tayyar, (2005) Çanakkale'de yürüttüğü çalışmada 8 hat ve 26 çeşit olmak üzere 34 genotip materyal nem oranlarının %11.7-12.4 arasında değiştiğini tespit etmişlerdir. Tahıl tanesindeki nem oranın da genetik faktörlerden daha çok bitkinin yetiştiği çevresel faktörlerinin etkisi bulunmaktadır, yürütülen çalışmada gübre dozlarındaki farklılık bu durumu açıklamaktadır.

Ekmeklik buğday çeşitlerinin farklı azot doz uygulamalarında elde edilen glüten ve lif oranlarına ait ortamalar ve grupları Çizelge 4'de verilmiştir.

Çizelge 4. Ekmeklik buğday çeşitlerinin farklı azot doz uygulamalarında elde edilen glüten ve lif oranlarına ait ortamalar ve grupları

	Glüten oranı			Lif oranı		
Gübre dozları	Pehlivan	Bezostaja-1	ortalamalar	Pehlivan	Bezostaja-1	Orta.
0	36.55	37.10	36.82 d	3.95	3.63	3.79 d
4	40.37	43.67	42.02 c	4.08	4.08	4.08 c
8	41.95	44.80	43.37 bc	4.56	4.27	4.41 b
12	44.82	46.50	45.66 ab	4.72	4.43	4.58 b
16	45.50	48.00	46.75 a	4.97	4.62	4.80 a
20	46.32	47.57	46.95 a	5.16	4.79	4.98 a
Orta.	42.58	44.60	43.59	4.57	4.30	4.44

Yürütülen çalışmada glüten oranının iki ekmeklik buğday çeşitleri arasında istatiksel farklılıkların oluşturmadığı, Pehlivan çeşidinin % 42.58, Bezostaja-1 çeşidinin % 44.60 glüten oranına sahip olduğu tespit edilmiştir. Farklı azot uygulamaları glüten oranlarına göre istatiksel olarak üç grup(a, c, d) ve ikide (ab, bc) geçiş grubu oluşturmuştur. En yüksek glüten oranı % 46.95 ile 20 kg da^{-1} ve %46.75 ile 16 kg da^{-1} azot doz uygulamasından elde edildiği belirlenmiştir. Glüten oranları yönünden 20, 16, 12 kg da-1 azot doz uygulamaları arasında istatiksel farklılığın olmadığı, diğer azot doz uygulamaları arasında istatiksel olarak önemli farklılıkların olduğu

kaydedilmiştir. En düşük glüten oranı % 36.82 ile 0 kg da^{-1} azot doz uygulamasından elde edildiği ve diğer azot doz uygulamalarından istatiksel olarak önemli farklılıklar oluşturduğu belirlenmiştir. Azot doz uygulamalarından 8 ve 12 kg da^{-1} uygulaması glüten oranı yönünden geçiş gruplarında yer almıştır. Glüten oranı yönünden ikinci düşük değer %42.02 ile 4 kg da^{-1} azot doz uygulamasından elde edildiği, 8 kg da^{-1} azot doz uygulaması hariç, diğer azot gübre uygulamalarından istatiksel olarak önemli farklılıklar kaydedilmiştir. Glüten oranı yönünden çeşit x azot doz uygulama interaksiyonlarında en yüksek % 48.00 ile Bezostaja-1 çeşidinin 16 kg da^{1} azot dozu uygulamasından, en düşük % 36.55 ile Pehlivan çeşidinin kontrol uygulamasında elde edilmiştir. Diğer interaksiyonlarda ise glüten oranlatı % 47.57-37.10 arasında değişim göstermiş ve istatistiksek farklılıkların oluşmadığı kaydedilmiştir (Çizelge 4.28). Glüten oranı, un kalitesinin saptanmasındaki en önemli özelliklerden biri olduğu, düşük oranda glüten barındıran buğdaylarda % 20'den az, orta derecedeki buğdaylarda % 20-27 arasında, iyi özellikteki buğdaylarda % 28- 35 arasında, yüksek glüten oranına sahip buğdaylarda ise oranın % 35'ten yukarı olduğu bildirilmektedir (Ünal, 2003). Tayyar, (2005) Çanakkale'de yürüttüğü çalışmada 8 hat ve 26 çeşit olmak üzere 34 genotip materyallerinde glüten değerlerinin 42.5-30.5 g, Kahrıman (2007) Çanakkale şartlarında yürütülen çalışmada glüten miktarının %25.3-43.6 arasında değişim gösterdiğini tespit etmişlerdir. Daha önceki yürütülen çalışmalarda elde edilen sonuçlardan görüldüğü gibi glüten oranının çeşittin genetik yapısının yanı sıra çevresel ve iklim faktörlerinde de etkilendiği anlaşılmaktadır.

Araştırmada incelenen özelliklerden ham lif oranının iki ekmeklik buğday çeşitleri arasında istatiksel farklılıkların oluşturmadığı, Pehlivan çeşidinin % 4.57 Bezostaja-1 çeşidinin % 4.30 ham lif oranına sahip olduğu gözlemlenmiştir. Farklı azot uygulamaları ham lif oranlarına göre istatiksel olarak dört grup oluşturmuştur. En yüksek ham lif oranı sırasıyla % 4.98, 4.80 ile 20 ve 16 kg da^{-1} azot doz uygulamasıyla aynı grupta yer aldığı ve diğer azot doz uygulamalarından istatiksel olarak önemli farklılıklar oluşturduğu kaydedilmiştir. En düşük ham lif oranı % 3.79 ile kontrol uygulamasından elde edildiği ve diğer azot doz uygulamalarından istatiksel olarak önemli farklılıklar oluşturduğu belirlenmiştir. Ham lif oranı yönünden ikinci düşük değer %4.08 ile 4 kg da^{-1} azot doz uygulamasından elde edildiği ve istatiksel olarak diğerlerinden farklı grupta yer aldığı tespit edilmiştir. Azot doz uygulamalarından 8 ve 12 kg da^{-1} uygulaması ham lif oranı yönünden aynı grubu oluşturarak, diğer azot uygulamalarından istatistiki olarak önemli farklılık oluşturduğu kaydedilmiştir. Çeşit x azot doz uygulama interaksiyonlarında ham lif oranı en yüksek % 5.16 ile Pehlivan çeşidinde 20 kg da^{1} azot dozu uygulamasından, en düşük nem % 3.63 ile Bezostaja-1 çeşidinden elde edilmiştir. Diğer interaksiyonlarda ise ham lif değerleri % 4.97-3.95 arasında değişim gösterdiği ve istatistiksek farklılıkların oluşmadığı kaydedilmiştir (Çizelge 30). Kubar ve ark. (2021), Çin'de buğday bitkisine 7.5, 15, 22.5 30 kg da^{-1} azot gübre uygulamasında, buğdayın kalite kriterlerine yalnızca N oranından değil aynı zamanda N uygulama zamanlarının da etkili olduğu belirtilmiştir. Yaraşır (2018) Buğday bitkisine uygulanan beş farklı dozlarda (0, 1, 2, 3, 4 t da^{-1}) sıvı biyogaz atıkları ile üç farklı (0, 9, 18 kg da^{-1}) mineral azot dozu etkisinin incelendiği çalışmada lif oranları % 2.87 - 3.29 arasında değiştiğini kaydetmiştir. Yürütülen çalışmada ham lif oranı üzerine azot dozlarının etkili olması çevresel faktörlerin etkili olduğunu ifade etmektedir.

Sonuç

Ekmeklik buğday çeşitleri olarak Elazığ bölgesinde üretimi yapılan Pehlivan ve Bezostaja-1 çeşitlerine farklı (0, 4, 8, 12, 16 ve 20 kg da^{-1}) azot gübre dozları uygulayarak yürütülen çalışmada bin tane ağırlığı, protein, nişasta, kül, yağ, nem, glüten ve lif oranlarını incelenmiştir. Yürütülen çalışmada Bezostaja-1 çeşidinin diğer Pehlivan çeşidinden daha yüksek bin tane ağırlığına sahip olduğu, kül oranı yönünden Pehlivan çeşidinin daha yüksek değere sahip olduğu kaydedilmiştir. İncelenen diğer özelikler yönünden çeşitler arasında farklılıkların önemli olmadığı belirlenmiştir. Araştırmada kullanılan ekmeklik buğday çeşitlerinin tane kalite kriterlerinden bin tane ağırlığı, protein, nişasta, kül, nem, glüten ve lif oranlarını üzerine uygulanan gübre dozlarının olumlu etkide bulunduğu kaydedilmiştir. Çalışmanın daha sonraki çalışmalara kaynak oluşturacağı ve daha kararlı sonuç elde edilmesi için gübre denemesinin tekrarlanması uygun görülmüştür.

Effects of Relationships Between Leaf Area Value Removed and Cob Characteristics in Corn Plants

Leyla İdikut[1*], Enes Hakan Seçilmiş[1]

[1]Kahramanmaraş Sütçü İmam Üniversitesi, Ziraat Fakültesi, Tarla Bitkileri Bölümü, Kahramanmaraş, Türkiye

Abstract

The corn plant completes its development in a very short time, the major organs contributing to the yield of the corn plant are the roots and leaves. The aim of this study was to examine the leaf areas, ear grain weights, cob weights, ear row numbers, and grain numbers of ear row by applying four different leaf removal treatments to D. 6761, P. 1921, P. 2105 and Klumet hybrid corn varieties and to determine the correlation relationship between the examined traits. It was observed that the leaf areas increased from the top tassel to the leaves above the ear, but the three leaves below the top tassel contributed more to the ear grain yield than the three leaves above the ear. It was recorded that all leaves above the ear contribute to the yield, and that there is a linear relationship between ear grain yield and leaf area and cob diameter. The effect of leaf removal practices on the number of ear rows and the number of grains per row is thought to be less effective than genetic factors.

Key words: *maize varieties, leaf removal, leaf area, grain weight, principal components analysis.*

Mısır Bitkisinde Yaprak Uzaklaştırmanın Koçan Özelliklerine Etkisi

Özet

Yetişme süresini çok kısa sürede tamamlayan mısır bitkisinin verimine katkıda bulunmada, büyük öncülük eden organları kök ve yapraklarıdır. Bu çalışmada, D. 6761, P. 1921, P. 2105 ve Klumet hibrid mısır çeşitlerinde dört farklı yaprak alma işlemi uygulanarak, çeşitlerin yaprak alanları, koçan tane ağırlıkları, somak ağırlıkları, koçanda sıra sayıları, sırada tane sayılarının incelenmisi ve incelenen özellikler arasındaki corelasyon ilişkisinin belirlenmesi amaçlanmıştır. Yaprak alanlarının tepe püskülünden koçan yukarısındaki yapraklar inildikçe artığı, fakat tepe püskülünün altındaki üç yaprağın koçanın üstündeki üç yapraktan daha fazla koçan tane verimine katkı sağladığı görülmüştür. Koçanın yukarısındaki tüm yaprakların verime katkısının olduğu, koçan tane verimi ile yaprak alanı ve somak çapı arasında doğrusal ilişki olduğu kaydedilmiştir. Koçan sıra sayısı ve sırada tane sayısı üzerine yaprak alma uygulamalarının etkisinin genetik faktörlerden daha az etkili olacağı sonucuna varılmıştır.

Anahtar kelimeler: *mısır çeşitleri, yaprak alma, yaprak alanı, tane ağırlığı, temel bileşenler analizi.*

Giriş

Bitkilerde verimi etkileyen faktörler arasında hücre fizyolojisi, yaprak alanı, yaprak şekli gibi morfolojik özellikler, su, ışık, sıcaklık, karbondioksit ve bitki besin maddeleri gibi çevresel faktörlerin yanı sıra asimilasyon hızı ve üretilen asimilat miktarı da yer almaktadır. (Li et al., 2021; Reddy et al., 2010). Bitkilerde güneş ışığının büyük bir kısmı yaprak ayası tarafından tutulmaktadır. Bu sebeple yaprak yüzeyi diğer bitkilere oranla yaprakları geniş olan mısır bitkisinin fotosentez ile enerji üretme faaliyeti oldukça yüksek olmaktadır (Yue et. al. 2021). Tohumların, sapların ve köklerin canlılıklarını devam ettirebilmek için gerek duydukları besin maddeleri yapraklardan taşınmaktadır. Yapraklar bitkinin diğer fotosentez yapan organlarından ekonomik öneme sahip koçana besin maddesinin taşınmasında, birçok bitkide olduğu gibi mısırda da verimi etkilemektedir (Aldrich ark., 1982). C4 bitkisi olduğu bilinen mısır bitkisi, güneşi ve suyu en iyi değerlendiren ve bu yüzden yüksek verim verebilen bir bitkidir. Özellikle koçan üzerindeki yapraklar güneşden en fazla yarar sağlayabilmektedir. (İdikut ve ark., 2020). Koçan altındaki veya koçan üstündeki yaprakların uzaklaştırılmaları arasında verim yönünden önemli farklılıklar olduğu kaydedilmiştir. Yaprakların erken dönemde uzaklaştırılması koçan sıra sayısını, koçan sırasında tane sayısını, tek koçan ağırlığını, tane verimini azaldığı, yaprak uzaklaştırma zamanı geciktikçe tane verimi önemli derecede arttığı, yeşil ve kuru yaprak verimleri, uzaklaştırma şekli ve zamanından etkilendiği kaydedilmiştir (Akıl ve Bengisu, 2020). Metre karede 10 bitkinin yoğunluğundaki mısır bitkisinin yaprak alan indekslerinin (LAI) yaprak uzaklaştırmayla LAI 8.2'den 5.5'e düşürüldüğünde, önemli ölçüde tane verim artışı gözlenmiştir (Liu ve ark, 2009). Koçan püskülü çıkışında, aşırı yaprak uzaklaştırma işlemlerinde, önemli ölçüde besin maddesinin azalmasına ve kuru madde birikiminin azaldığı, fakat tohuma besin taşınması sırasında iki yaprağın uzaklaştırılması önemli ölçüde tohum ağırlığını (% 5.7) ve tohum sayısını (% 6.4) kontrole göre artırdığı rapor edilmiştir (Raza ve ark., 2020). Yüksek bitki yoğunluğunda en üstteki

ve sonraki yaprakları kesilmesi gölgelik fotosentezini ve kuru madde birikimini teşvik ederek, yaprak yaşlanmasının gecikmesine ve daha yüksek besin taşınmasına yol açarak tane veriminin artışını sağlamıştır. Mısır bitkisinin 4 veya 6 yaprağın alınmasıyla, tohum sayısı ve tane ağırlığı önemli düşüş görülmüştür (Liu ve ark, 2015). Mısır bitkisi üzerinde benzer çalışmaların yapılması, yetiştiricilere daha küçük tepe yapraklı mısır çeşitleri geliştirmeleri için yeni bir bakış açısı sağlayacaktır. Ayrıca çiftçilerin verimlerini ve gelirlerini artırmak için mahsul kanopilerini manipüle edecek, bu yeni tarımsal uygulamayı benimsemeleri geliştirilmelidir (Raza ve ark, 2019). Bu çalışmada, mısır bitkisinin yaprakları hayvanlar tarafından sevilerek yemesi, üst yaprakların uzaklaştırılmasından dolayı hasadı öne çekmesi göz önünde bulundurularak, farklı mısır çeşitlerinde tozlanmadan bir hafta sonra koçan üzerindeki farklı bölgelerdeki yapraklar bitkiden uzaklaştırılmasının verim ve verim öğelerine etkisi ve aralarındaki ilişkinin araştırılması amaçlanmıştır.

Materyal ve Metod

Araştırma Akdeniz sahillinde yer alan Adana ili Kozan ilçesi Bucak köyünde yürütülmüştür. Çalışmada dört (D. 6761, P. 1921, P. 2105, Kalumet) mısır çeşidi kullanılarak, tesadüf bloklarında bölünmüş parsel deneme deseninde üç tekerrürlü olarak, 70 cm sıra arası mesafesinde 15 cm sıra üzeri mesafesinde 5 m uzunluğunda ve dört sıra sırta ekim şekilde ekimi gerçekleştirilmiştir. Bitkinin gelişme sürecindeki sulama gübreleme, yabancı ot gibi bakım işleri fizeksel olarak gözlenerek, gerek duyulan işlemler yapılmıştır. Bitkinin azot ve fosfor gereksinimi taban ve üst gübreme olarak dekara net 10 kg fosfor ve 35 azot uygulanmıştır. Yaprak alma işlemleri tozlanma gerçekleştikten bir hafta sonra yapılmıştır. Farklı mısır çeşitlerinde yaprak alma her çeşit için ayrı ayrı yapılmıştır. Yaprak alma 1.Tepe püskülü çıkışından bir hafta sonra koçan yukarısındaki 3 yaprak koparılmış, II. Tepe püskülü çıkışından bir hafta sonra tepe püskülün altındaki 3 yaprak koparılmış, III. Tepe püskülü çıkışından bir hafta sonra koçan yukarısındaki tüm yaprak koparılmıştır. IV. Bu üç uygulama için kontrollerde yaprak alma olmamıştır.
Deneme alanının toprak yapısı çok fazla kireçli, hafif alkalin ph' ya sahip, killi-tın bünyeli, tuzsuz, organik maddesi az, potasyum (K) yüksek, fosfor (P) çok az, çinko (Zn) düşük, demir (Fe) içeriği çok yüksek seviyededir. Akdeniz bölgesinde Haziran-Ağustos aylarında yağışın yok denecek kadar az olması nedeniyle, mısır bitkisinin gelişimini sürdürdüğü dönemde suyu aktif olarak kullandığı için beş kez salma sulama sistemi ile bitkiler sulanmıştır. Bitkiler fizyolojik olgunluğu tamamladıktan sonra, danenin sömeğe bağlandığı yerdeki siyah nokta dikkate alınarak elle hasat edilmiştir. Mısır çeşitlerininin tozlanmadan yedi gün sonra yaprak alma uygulanmıştır. Alınan yaprakların koparıldığı yerden ucuna kadar boyu ve ortasından eni ölçülerek 0.75 katsayı ile çarpılarak ortalama yaprak alanı hesaplanmıştır (Maddoni, and Otegui, 1996). Hasat edilen koçanların üzerinde mısır sıraları sayılarak koçan sıra sayısı, koçanın üzerinde boyuna taneler sayılarak sırada tane sayısı belirlenmiştir. Koçanın üzerindeki taneler elle harmanlanan taneler tartılarak, koçan tane ağırlığı olarak kaydedilmiştir. Taneleri çıkartılmış sömeğin çapı kumpasla ölçülerek belirlenmiştir.
Araştırma sonunda incelenecek özelliklerin istatiksel analizinde JMP 13 paket programı ve ortalamaların kaşılaştırılmasında Duncan çoklu karşılama uygulanmıştır (JMP, 2013).

Bulgular ve Tartışma

Farklı mısır çeşitlerine tozlanmadan 7 gün sonra koçanın yukarısındaki farklı yapraklar uzaklaştırılarak yapılan çalışmada incelenen özelliklerin uygulanan faktörlere ve çeşitlere göre önemli farklılık oluşturduğu Çizelge 1'de görülmektedir.
Mısır çeşitlerinin yaprak alanları, tozlanmadan bir hafta sonra tepe püskülünün altındaki üç yaprağın alanı, koçanın yukarısındaki üç yaprağın alanı, koçan yukarısındaki tüm yaprak ve kontrolün yaprak alanları arasında istatistik önemli farklılığın olduğu ve mısır çeşitlerine göre de önemli farklılık oluştuğu kaydedilmiştir. Tüm çeşitlerde tepe püskülünün altındaki üç yaprağın alanı, diğer uygulamalara göre en düşük yaprak alanına sahip olmuştur. Onu ikinci sırada koçanın yukarısında çıkarılan üç yaprak alanı, üçüncü sırada koçan yukarısı tüm yaprak alanı izlemiştir. En fazla yaprak alanı ise kontrol uygulamasında elde edilmiştir. Genel olarak tepe püskülü altındaki üç yaprak alanı, koçanın altındaki yaprak alanından düşük olduğu görülmüştür. Kontrol ile koçanın yukarısında uzaklaştırılan yaprak alanı arasında ise istatistiki farklılığın olmadığı kaydedilmiştir. Burada kontrol koçanın yukarısındaki tüm yaprakların bitki üzerinde kalması, diğerinde ise koçanın yukarısındaki tüm yaprakların koparılmasıdır. Bu nedenle yaprak alanı yönünden farklılığın olması doğal beklenen bir sonuçtur (Çizelge 1)..
D 6761, P 2105 ve Klument çeşitlerinin koçanın yukarısında farklı bölgelerden yaprak alınanlar ile hiç yaprak alınmayanların sömek çapı arasında istatiksel önemli farklılıklar elde edilmiştir. P 1921 çeşidinin kontrol ile tepe püskülünün altındaki üç yaprağın uzaklaştırılmasıyla uygulaması arasında sömek çapı yönünden istatistiki farklılık oluşturmaz iken, diğer iki uygula arasında önemli farklılık oluşturmuştur. Tüm çeşitlerde koçanın yukarısındaki farklı bölgelerden yaprak uzaklaştırmalardaki sömek çapı kontrol uygulamalarından daha düşük olmuştur. Yürütülen araştırma sonuçlarından sömek çapı üzerinde yaprak alanını olumlu önemli etkisinin olduğu anlaşılmaktadır. Diğer ifadeyle tepe püskülü çıkışından sonra koçanın yukarısındaki yaprakların uzaklaştırması koçan çapının azalacağını ifade etmektedir.

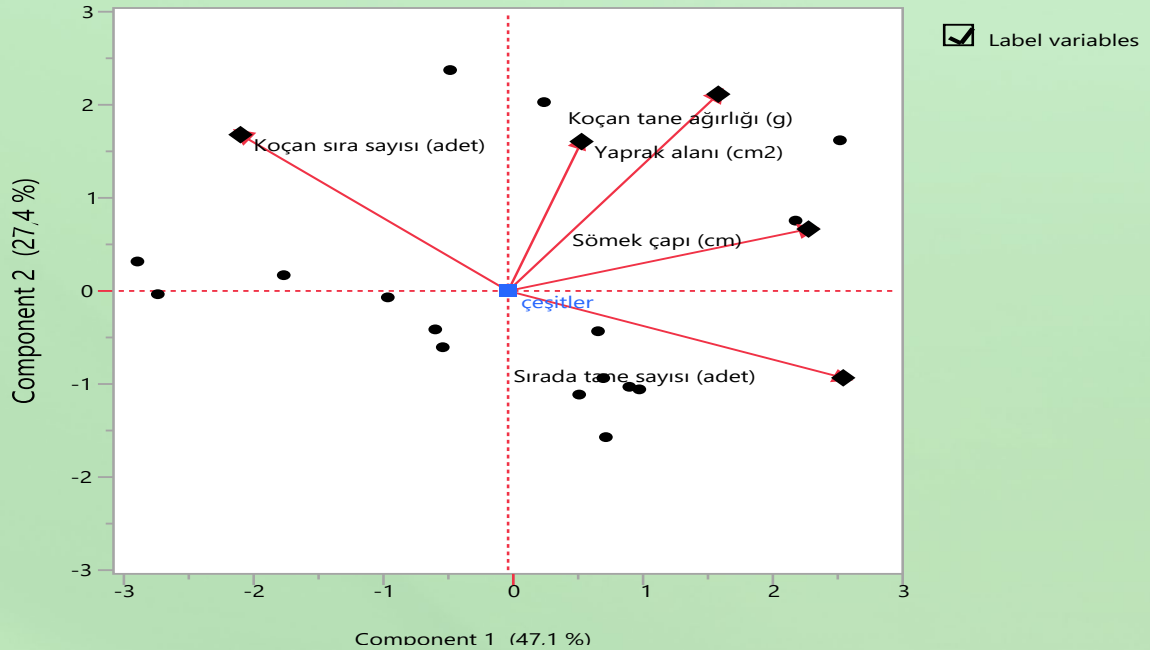
*:p<0.05 **: p< 0.01, tepe püskülü altındaki üç yaprak (TPAÜY), koçan püskülünün yukarısındaki üç yaprak (KPYÜY), koçanın yukarısındaki tüm yapraklar (KYTY).

Koçan tane ağırlığı çeşitlere ve koçanın yukarısındaki farklı bölgelerdeki yaprak uzaklaştırılmasına göre istatiksel önemli farklılıklar oluşturmuştur. Tüm çeşitlerde koçan tane ağırlığı, koçanın yukarısındaki farklı bölgelerde yaprak uzaklaştırılması yapılan uygulamalarla, hiç yaprak uygulaması yapılmayan kontrollerle karşılaştırıldığında en yüksek değerlerin kontrol uygulamalarından elde edildiği kaydedilmiştir. Kaçanın farklı bölgelerinde yaprak uzaklaştırma uygulamaları kıyasladığında, koçan tane ağırlığı tepe püskülünün altındaki üç yaprağın alınması, koçanın yukarısındaki üç yaprağın uzaklaştırılmasına göre verim düşüşünün daha az olduğu gözlenmiştir. Diğer bir ifadeyle tepe püskülünün altındaki üç yaprağın, koçanın yukarısındaki üç yapraktan daha fazla tane verimine katkı sağladığı anlaşılmaktadır. Koçanın yukarısındaki tüm yapraklar alındığında ise tepe püskülünün altındaki üç yaprağın, koçanın yukarısındaki üç yapraktan daha fazla verim düşüşüne neden olduğu kaydedilmiştir. Bu sonuç mısır bitkisinin tozlanmasından 7 gün sonra olmasına rağmen koçanın yukarısındaki yaprakların verime katkısının farklı olduğu ve tepe püskülüne yakın olan üst yapraklarım verime etkisinin daha yüksek olduğu anlaşılmaktadır. Kontrol uygulamasındaki tane verimi irdelendiğin, tepe püskülü çıkışından bir hafta sonra koçanın yukarısındaki tüm yaprakların uzaklaştırılması yaklaşık % 50 verim düşüşüne neden olacağı, mısırda döllenmeden sonraki dönemle yaklaşık % 50 besin birikimin devam edeceğini göstermektedir. Bu nedenle mısır bitkisinde dönemeden sonrada bitki gereksinimi dikkatlice takip edilerek, yüksek verim için gerekli çevre koşullarının sağlanması gerekmektedir



Mısır çeşitlerinde tozlanmadan 7 gün sonrasında, tepe püskülü altında, kaçan püskülü yukarısındaki üç yaprağın, tüm yaprakların uzaklaştırılması ve kontrollerin koçanda sıra sayısı çeşitlere göre farklılık göstermiştir. Kaçanın yukarısındaki farklı bölgelerden yaprak uzaklaştırmanın D 6761 ve P 2105 çeşitlerinin kaçanda sıra sayısı üzerine önemli etkisi olmamıştır. P. 1921 çeşidi koçanı yukarısındaki üç yaprağın ve kaçanın yukarısındaki tüm yaprakların uzaklaştırılması ile kontrolle arasında farklılık oluşturmadığı kaydedilmiştir. Tepe püskülü aşağısındaki üç yaprağın uzaklaştırılması ile koçanın yukarısındaki üç ve tüm yaprakların uzaklaştırılmasında oluşan koçanda sıra sayısı arasında istatistiki farklılık oluşmuştur. Klumet çeşidinin koçanda sıra sayısı kontrole ile farklı bölgelerden yaprak uzaklaştırma arasında önemli farklılık kaydedilmiştir. Kaçan sıra sayısı verim unsurlarından biri olmakla birlikte çeşit özelliği çevresel faktörlerden daha baskındır, bu nedenle farklı yaprak uzaklaştırmanın etkisi çok net görülememiştir (Svecnjak ve ark. 2006; Abendroth ve ark. 2011)

Koçan sırasında tane sayısı koçanın yukarısında farklı bölgelerden yaprak uzaklaştırma ve çeşitlere göre istatiksel farklılık göstermiştir. En yüksek koçan sırasında tane sayısı P 1921 çeşidinde kaydedilmiştir. P. 1921 çeşidinin koçanın yukarısında farklı bölgelerden yaprak alınanlar ile hiç yaprak alınmayanların koçan sırasında tane sayısı arasında istatiksel önemli farklılıklar elde edilmiştir. En yüksek sırada tane sayısı hiç yaprak alınmayan kontrol uygulamasından elde edilmiştir. D 6761 ve P 2105 çeşitlerinin kaçanın yukarısındaki farklı bölgelerden yaprak uzaklaştırmanın kaçan sırasında tane sayısına istatistikse etkide bulunmamıştır. Klumet çeşidi koçanı yukarısındaki üç yaprağın ve kaçanın yukarısındaki tüm yaprakların uzaklaştırılması ile tepe püskülü aşağısındaki üç yaprağın uzaklaştırılması koçan sırasında tane sayısı yönünden istatistiki önemli farklılık görülmemiştir. Fakat

kontrol ile koçanın yukarısında tüm yaparak ve üç yaprağın uzaklaştırılması koçan sırasındaki tane sayısında istatistiksel önemli farklılık kaydedilmiştir. Tüm çeşitlerde koçanın yukarısındaki farklı bölgelerden yaprak uzaklaştırmalarda koçan sırasında tane sayısı kontrollerden daha düşük olarak gerçekleşmesi, koçan sırasında tane sayısının çevresel faktörlerden ekileneceğini ifade etmaktedir (Çizelge 1).
Mısır çeşitlerinin yaprak alanı, somak çapı, koçan tane ağırlığı, koçan sıra sayısı, sırada tane sayısı ait correlations Çizelge 2. verilmiştir. Araştırmada kullanılan çeşitlerin incelenen özelliklerine ait temel bileşenler analizi Şekil 1'de verilmiştir .

Çizelge 2. Mısır çeşitlerinin yaprak alanı, somak çapı, koçan tane ağırlığı, koçan sıra sayısı, sırada tane sayısı ait correlations.

	Yaprak alanı (cm2)	Sömek Çapı (cm)	Koçan tane ağırlığı (g)	Koçan sıra sayısı (adet)	Sırada tane sayısı (adet)
Yaprak alanı (cm2)	1,0000	-0,0027	0,3333	-0,0241	0,0717
Sömek çapı (cm)	-0,0027	1,0000	0,6213	-0,3109	0,5790
Koçan tane ağırlığı (g)	0,3333	0,6213	1,0000	0,0451	0,2570
Koçan sıra sayısı (adet)	-0,0241	-0,3109	0,0451	1,0000	-0,8276
Sırada tane sayısı (adet)	0,0717	0,5790	0,2570	-0,8276	1,0000

Şekil 1. Mısır koçan yukarısında yaprak uzaklaştırma işlemi yapılan D. 6761, P. 1921, P. 2105 ve KWS Klument çeşitlerinin yaprak alanı, sömek çapı, koçan tane ağırlığı, koçan sıra sayısı, koçan sırasında tane sayısı özelliklerine ilişkin biplot grafiği.

D. 6761, P. 1921, P. 2105 ve Klumet mısır çeşitlerine farklı yaprak alma uygulaması sonucunda yaprak alanı ile koçan tane ağırlığı, sömek çapı ve sırada tane sayısı arasında olumlu ve önemli ilişkinin olduğu görülmektedir (Çizelge 2). Yaprak alanı ile koçan sıra sayısı arasında ise yaklaşık 90 derececelik bir açının olduğu ve nört bir ilişkinin olduğu anlaşılmaktadır. Sırada tane sayısı ile koçan sıra sayısı arasında ise negatif bir ilişki gözlenmiştir. Temel Bileşen 1 (47.1%) ve 2 (27.4%) varyasyonun % 74.5'ini açıklamıştır (Şekil 1). Bu durum yürütülen araştırmanın önemini vurgulamakla birlikte, mısır bitkisinin koçan yukarısındaki yaprakların verime katkısının önemini açıklamaktadır.

Tartışma

Dört hibrid mısır çeşitleri Nisan-Eylül ayları arasında Adana-Kozan ilçesi Bucak köyünde civarında yetiştiriciliği yapılmıştır. Hibrid mısır çeşitlerinin tepe püskülü çıkışından yedi gün sonra; a) koçanın tepe püskülü altındaki üç yaprak, b) koçan yukarısındaki üç yaprak, c) koçanın yukarısındaki tüm yapraklar, d) kontrol olmak üzere dört farklı yaprak alma işlemi uygulanmıştır. Yaprak alma uygulamalarında alınan yaprakların alanları hesaplanmıştır. Söz konusu uygulamalar eşliğinde tane nemi % 14-15 düştüğünde, ürün hasadı yapılarak, koçan somek çapı, tane

ağırlığı, koçan sıra sayısı, koçan sırasındaki tane sayıları incelenmiş ve Principal Components analiz kullanılarak aralarındaki ilişki tespit edilmiştir. Araştırmada kullanılan D. 6761, P. 1921, P. 2105 ve KWS Klumet mısır çeşitlerinin hepsinde en yüksek yaprak alanının kontrol uygulamasında olduğu, onu ikinci sırada koçan yukarısındaki tüm yaprakların alınması, üçüncü sırada ise koçanın yukarısındaki üç yaprak alma uygulasının izlediği görülmüştür. En az yaprak alanının ise tüm çeşitlerde tepe püskülü altındaki alınan üç yaprak alanında kaydedilmiş. Hibrid mısır çeşitlerinde en az somak çapı kaçan yukarısındaki tüm yaprakların uzaklaştırılmasında, en yüksek ise kontrol uygulamasından elde edilmiştir. Somak çapının yaprak alanının uzaklaştırılasıya azalması fotosentez yapacak verim bileşenin azalmasından kaynaklanmıştır. Adhikari et al. (2021) ifade ettiği gibi mısır bitkisine uygulanan gübre dozunun artmasıyla somak çapının artması çevresel faktörlerin etkisini açıklamaktadır. Koçan tane ağırlığındada en yüksek değer hiç yarak kaparılmayan konrol uygulamadan, en az koçan tane ağırlığı koçan yukarısındaki tüm yaprak almada kaydedilmiştir. Denenen mısır çeşitlerinde koçanın yukarısındaki üç yaprağın uzaklaştırılması uygulamasında koçan tane ağırlığının tepe püskülü altındaki üç yaprağın uzaklaştırılmasından daha düşük olduğu belirlenmiştir. Cokkızgın ve ark. (2022) uygulanan gübre dozlarına ve yıllara göre koçan tane ağırlığının değiştiğini ve çevresel faktörlerden etkilendiğini kaydetmişlerdir. Koçan püskülü çıkışında, aşırı yaprak uzaklaştırma işlemlerinde, önemli ölçüde besin maddesinin azalmasına rapor edilmiştir (Raza ve ark., 2020). Yaprak alanı, yaprağın morfolojik özellikleri, çevre faktörleri verime etki eden faktörler olduğu bilinmektedir (Li et al., 2021; Reddy et all., 2010). Diğer ifadeyle tepe püskülü aşağısındaki yaprakların, koçanın yukarısındaki yapraklardan daha fazla tane verimine katkısının olduğu tespit edilmiştir. Mısır bitkisinde yaprak alanları tepe püskülüne doğru azaldığı, fakat tane verimine katkısının daha fazla olduğu vurgulanmıştır (Yetişti ve Soylu, 2020). Mısır çeşitlerinin koçan sıra sayısı ve sırada tane sayıları kontrol uygulamalarında daha yüksek bulunmuştur. Koçanın yukarısındaki tüm yaprakların, koçanın üstündeki üç yaprağın ve tepe püskülü altındaki üç yaprağın uzaklaştırılmasında, koçan sıra sayısı ve sırada tane sayısı farklılık gösterdiği, söz konusu farklılığın yaprak uzaklaştırma uygulamalarından bağımsız farklılığın olduğu anlaşılmaktadır. Bu durum koçanda sıra sayısı ve sırada tane sayısının koçan ve tepe püskülü çıkışından önce büyüme konisindeki oluşumla ilgili olduğu düşünülmüştür (Rai et al., 2021). Araştırmada incelenen özelliklerden yaprak alanı ile somak çapı ve koçan dane ağırlığı arasında önemli ilişkinin olduğu kaydedilmiştir (Liu ve ark., 2015). Yaprağın verim bileşenlerden ilk sırada yer aldığı kabuledilmektedir (Pereira ve ark. (2012).

Sonuç

Araştırmada D. 6761, P. 1921, P. 2105 ve KWS Klumet hibrid mısır çeşitlerinin döllenme oluştuktan yedi gün sonra koçanın tepe püskülü altındaki üç yaprak, koçan yukarısındaki üç yaprak, koçanın yukarısındaki tüm yapraklar ve kontrol olmak üzere dört farklı yaprak alma işlemi uygulanmıştır. Çeşitlerin yaprak alma uygulamalarındaki yaprak alanları, hasat olgunluğun elde edilen koçanların tane ağırlıkları, sömek ağırlıkları, koçan sıra sayıları ve sırada tane sayıları özellikleri incelenerek aralarındaki ilişki belirlenmeye çalışılmıştır. Sonuç olarak koçanın yukarındaki yaprakların alanlarının tepe püskülüne doğru azaldığı, tepe püskülünün altındaki yaprakların koçanın üstündeki yapraklardan daha fazla verime etkisinin olduğu, yaprak alanı ile koçan tane verimi arasında yakın ilişkinin olduğu, yaprak uzaklaştırma uygulamaları ile koçanda sıra sayısı ve sırada tane sayısı arasında istatistiksel farklılık olmakla birlikte aralarındaki ilişkinin bağımsız olduğu belirlenmiştir.

Abstract

This review article explores the importance of eco-friendly materials in the food industry. Eco-friendly materials, often called green or environmentally friendly materials, are becoming increasingly popular in various sectors that aim to benefit the environment. One of the key advantages of using these materials is that they are often made from recycled or renewable resources. This approach helps to reduce waste, lower greenhouse gas emissions, and minimize carbon footprints. This is especially important in the food sector, like biofilm food packaging, beeswax food wraps, and waste food to ethanol. In addition, targets food protection and reduces environmental pollution.

Keywords: *eco-friendly, food industry, organic waste.*

Introduction

In the modern world, industries have developed a direction for eco-friendly materials, also known as environmentally friendly or green materials, which aim to utilize natural substances to benefit our environment (Abdur Rahman et al., 2023; Nowotna et al., 2019). One of the significant benefits of using eco-friendly materials is that they are often sourced from renewable or recycled resources, which helps reduce carbon footprints, greenhouse gas emissions, and waste (Abera, 2024). These materials can come from various sources, including plants such as bamboo, cork, and hempcrete (Orhon & Altin, 2020); agricultural waste such as fruits, vegetables, and grains (Kılınç & Korkmaz, 2024; Xie, Y. 2020; Kocabaş et al., 2021); as well as animal sources like crab, lobster, shrimp (Bakshi et al., 2000), and cow (Nowotna et al., 2019). Industries can greatly reduce their environmental impact by choosing materials that require less energy to produce and are either biodegradable or recyclable. This is especially important in the food industry and other sectors. It is essential to note that while all biodegradable products can be viewed as eco-friendly regarding waste decomposition, not all eco-friendly products are biodegradable. Some may be recyclable, reusable, or mitigate environmental impact differently.

Many sectors of the food industry are concerned about grocery spoilage and contamination due to microbes and lipid oxidation (Pinto et al., 2017). These issues render food products unsafe for consumption and can result in substantial financial losses. Effective food packaging can help reduce microbial spoilage, minimized lipid oxidation, extend shelf life, and enhance the visual appeal of food products.

The importance of eco-friendly materials in the food industry was studied under the titles a: biodegradable material used as biofilm or bio-plastic (starch, gelatin, and chitosan package), beeswax food wrap, and b: food and agriculture waste can produce biofuels such as bioethanol.

Biodegradable material used as biofilm or bioplastic

Plastic and food waste contribute significantly to environmental pollution and health issues (Ramadhan, 2020; Verma et al., 2016; Jambeck et al., 2015). As consumers become more aware of health and well-being, the transfer of substances from food packaging materials to the food itself has sparked debate among legal experts and researchers. Researchers are also working to reduce plastic waste by converting food waste into biodegradable packaging. These materials (biopolymers) can break down and return to natural elements within a short time in the environment, helping to protect our surroundings (Song et al., 2009; Mohammadalinejhad et al., 2020). Figures 1 and 2 several biodegradable materials are found in our environment, including polysaccharides, proteins, and lipids (Cazon et al., 2017; Nasrollahzadeh et al., 2020; Wu et al., 2017).

Polysaccharides and proteins are biopolymers derived from organic waste, bamboo plants, cork, and hempcrete. Although they currently hold little economic value, they offer a cost-effective option for use as biodegradable films, additives, or preservatives (Samrot et al., 2020). Recent research has explored the use of bioactive polyphenolic pigments extracted from food waste to create biodegradable films (Bhargava et al., 2020). These films can serve as eco-friendly and sustainable packaging materials.

A large number of studies have been conducted on biofilm packaging materials, such as polysaccharide films (including chitosan, starch, cellulose, and pectin), as highlighted by Cazon et al. in 2017; protein films (such as casein, whey, and gelatin) referenced by Chen et al. in 2019; and lipid films (like waxes) discussed by Callegarin et al., in 1997. These packaging materials demonstrate excellent oxygen barriers, adequate protection against oil and gas, antimicrobial properties, antioxidant strength, and flexibility (Moeini et al., 2022; Trinh et al., 2023).

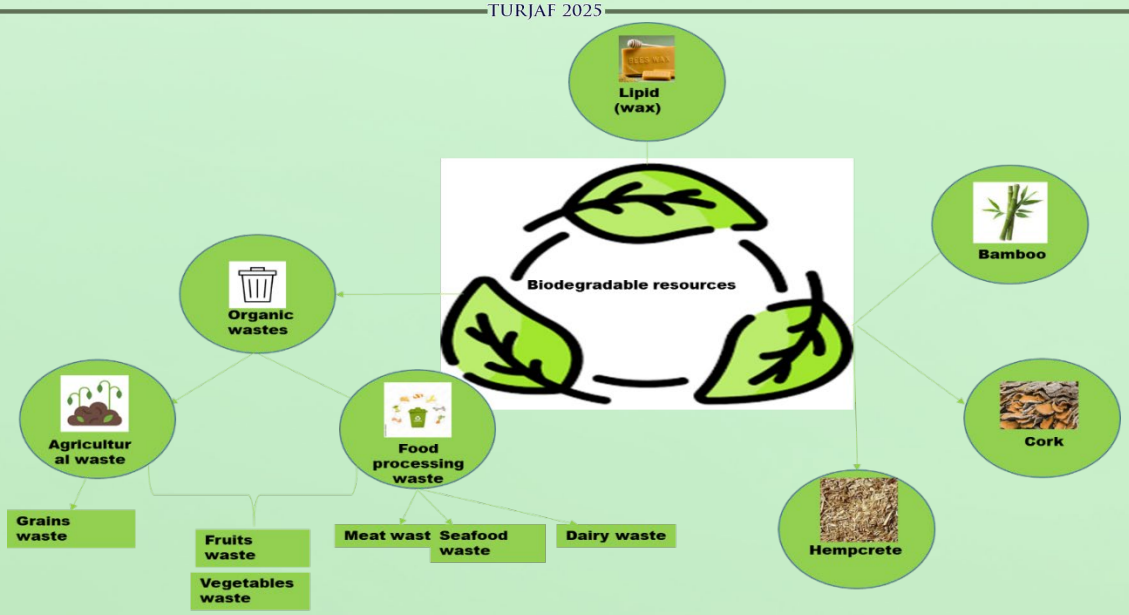

Figure 1. A brief overview of the classification of biopolymers by modified Popoola and Bukola (2022).

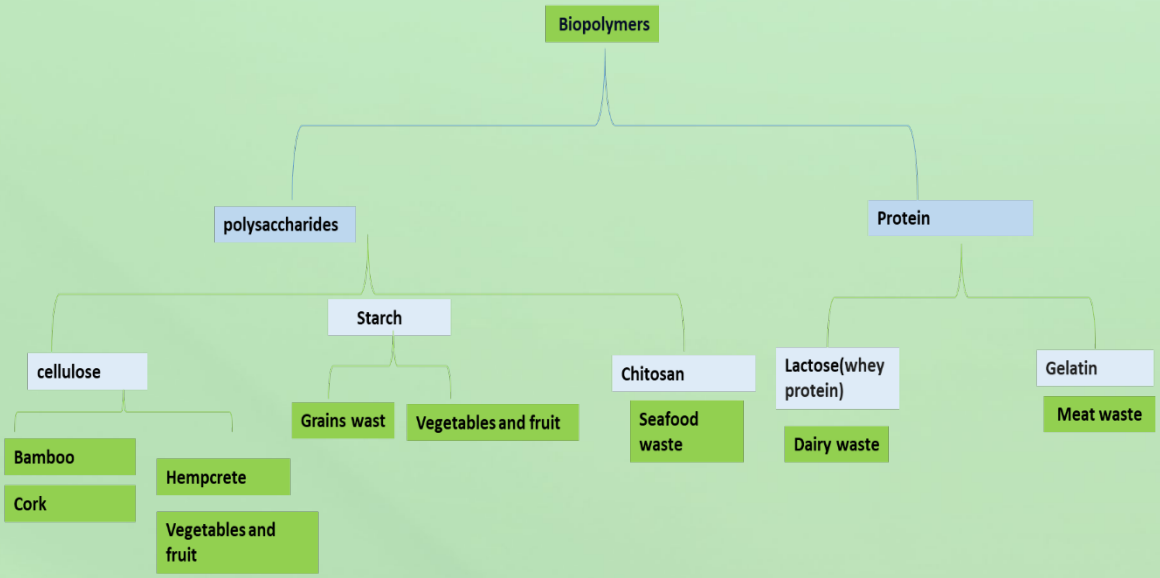

Figure 2. A brief overview of the classification of biopolymers. Inspired from Rhim et al. 2013 and Samrot et al. 2020.

Beeswax food wrap

Beeswax is a naturally antibacterial substance commonly used to create food wraps. It is biodegradable, sustainable, compostable, and environmentally friendly (Gupta et al., 2023).

Beeswax wraps are made from organic cotton, beeswax, plant oils, and tree resin, and they are promoted as a durable and flexible alternative to plastic wrap (Skiver, 2023). Some studies indicate that beeswax can positively affect the shelf life of food. Research from Fratini et al. (2016), Ghanem Nevine (2011), and Kacániová (2012) has reported that beeswax possesses antimicrobial properties, which may inhibit the growth of bacteria and fungi. Additionally, Pinto et al. (2017) found that Abeego wraps could inhibit food-borne bacterial pathogens and help prevent food spoilage.

Waste Food to Ethanol

Bioethanol has been utilized in the transportation and energy sectors for decades (Akin et al., 2021). It is produced from various sources, including sugarcane waste, food waste, biomass feedstocks, and crops such as corn and wheat (Byadgi & Kalburgi, 2016; Braide et al., 2016). This production can occur without negatively impacting the food supply or land use. Biomass energy is becoming increasingly popular as a clean and sustainable energy source (Bhatia et al., 2023).

One significant advantage of diverting food waste from landfills is reducing greenhouse gas emissions. When food waste decomposes in landfills, it generates methane, a potent greenhouse gas that contributes to climate change. By converting food waste into biofuel instead of allowing it to decompose in landfills, we can prevent methane release and significantly reduce our carbon footprint (Bhatia et al., 2032).
Additionally, a study by Gauder et al. (2011) showed that Brazilian food production increased fivefold from 1961 to 2008, with sugarcane crops representing 3% of agricultural production. This research analyzed the competition between bioethanol production and food production, revealing that over 20 million hectares of land will be available for agricultural production in the future. Three scenarios were explored, indicating that primary food production could increase 1.5 times and bioethanol production 1.8 times between 2007/2008 and 2020. This growth could meet 38% of the total energy demand in the Brazilian transport sector.

Conclusions

Biodegradable materials have become essential in our lives due to their significant impact on our environment and health. These materials are derived from natural sources, such as organic waste from food and agriculture, which are both abundant and cost-effective. Additionally, they offer antimicrobial and antioxidant properties, enhancing the performance of packaging systems. Moreover, biodegradable materials can be utilized as biofuels, such as bioethanol, in the food, transportation and energy sectors beyond. Developing biodegradable materials from food and agricultural waste offers several benefits, as it reduces the reliance on plastics, decreases plastic waste, and minimizes food waste simultaneously. This approach promotes overall environmental sustainability.

Garlic and Ginger Pastes as natural Antioxidant in Spent Hen Meat Nugget

Olayemi R. Awodoyin and Oluwatobiloba D. Oyekunle

Department of Animal Science, University of Ibadan, Ibadan, Oyo State, Nigeria
Corresponding author, Telephone: +234(0) 8164193904; Email: olayemiawodoyin@gmail.com

Abstract

Economic value of spent hen can be improved through value addition. However, spent hen contain high fat and coupled with the fact that processed chicken meat is more susceptible to oxidative deterioration make spent hen meat products prone to oxidative degradation. Therefore, the need for antioxidant inclusion during spent hen meat product formulation. Five spent hen chicken nugget emulsions were formulated (T1 ascorbic); T2 0.5% Garlic, T3 1.0% Ginger, T4 0.5% Ginger, T5 1.0%Ginger. The mixtures from each formulation were filled into boxes (20×10 cm) (approximately 40±1 g each), deep fried in Grand Soya oil® for 10 minutes at 190±2ºC (frying temperature). The fried nuggets were allowed to cooled down to room temperature and a portion from each nugget was packaged in air tight zip loc bags and stored in a refrigerator (4ºC). Frying yield (%), phenol content (GAEmg/g, flavonoid (mg QE/g), cholesterol (%) and Thiobarbituric reactive substances (TBARS) mg MDA/kg). (Data generated were analysed using ANOVA@Pα0.05.

Frying yield 92.29 (0.5% ginger) is similar to 88.62 (0.5% garlic) and significantly higher than 82.29 (ascorbic) and 85.72 (1.5% garlic) but significantly lower than 97.87 (1.5% ginger). Nugget with 1.5% ginger had 24.92 phenol content which is significantly lower ($P<0.05$) than 20.47 (0.5% ginger), 18.37 (1.5% garlic), 17.63 (0.5% garlic) and 16.06 (ascorbic). Flavonoid (9.34) and cholesterol (72.82) contained in ascorbic nugget is significantly higher than 8.20; 61.84 (0.5 ginger), 8.69; 57.09 (1.5% ginger), 4.71; 68.49 (0.5% garlic) and 6.32; 59.05 (1.5% garlic) for flavonoid and cholesterol respectively. Irrespective of the storage days, ascorbic nuggets had higher TBARS levels than nuggets with ginger and garlic pastes.

The reduced cholesterol contents and low levels of TBARS in the spent hen chicken nuggets with ginger and garlic pastes elucidated that both spices can be part of spent hen chicken nuggets formulation.

Abstract

To understand the direction of broiler farming research over the past few decades, this study was conducted using Web of Science as a database. A total of 29,193 documents were published on this platform from 2014 to 2024 on various topics related to broilers. 91.86% of the existing documents were published in the form of scientific articles and the most popular categories of publications are none other than "Agriculture Dairy Animal Science" and "Veterinary Sciences**".** In terms of publication reviews, "Poultry Science" and "Animals" have been the most requested for the publication of studies conducted on broilers over the last 10 years. As for the most productive countries in terms of producing scientific documents, China and the United States have largely distinguished themselves from other countries internationally, strengthening their reputation in broiler farming. Given the vastness of the database, a combination of keywords and two filters were used. For the analysis of the data, only the top 50 most referenced and cited studies were considered. The analysis of the documents made it possible to understand that many studies have been carried out on key themes such as genetics, egg incubation, stress on broilers, nutrition, the use of antibiotics, avian diseases and on the behavior of poultry in the rearing environment. However, topics related to sperm quality, climate change, effluent management and greenhouse gas reduction are still underexplored and will certainly be the subject of future research.

Keywords: *Broilers, research, animal welfare, genetics, stress, Web of Science*

Introduction

Scientific research is research conducted with the goal of contributing to science through the systematic collection, interpretation, and evaluation of data in a planned manner (Ozhan Caparlar & Donmez, 2016). It is essential to produce new knowledge to better understand a situation or a phenomenon. It is also an essential pillar for the development of technological and social innovations. For many decades, scientific research has experienced a certain expansion, but in recent years this trend has been more accelerated. In fact, in 2022, more than 5.14 million scientific articles were published worldwide, an increase of 22.78% since 2018 (Benjamin et al., 2023).

Whether in the field of human, animal, technological or other sciences, it should be noted that no sector that wants to evolve can achieve this without the help of scientific research and the livestock sector is no exception. Protein contributes to nearly 40% of total agricultural production in developed countries and 20% in developing countries, and supports the livelihoods of at least 1.3 billion people worldwide (FAO, 2025). Even if the contribution of the livestock sector is not limited to the production of meat, milk and eggs, However, it would be difficult to fully meet the nutrient needs of the population without it. Foods of animal origin make a critical contribution to global nutrition and are an excellent source of macro- and micronutrients (Mottet et al., 2017).

At the same time, livestock products account for 18% of global calories, 34% of global protein consumption and provide essential micronutrients, such as vitamin B12, iron, zinc and calcium that can be locally difficult to obtain in adequate amounts from plant-based foods alone (Murphy & Allen, 2003; Randolph et al., 2007). However, we cannot talk about the livestock sector without talking about broilers. Indeed, broiler farming is by far the largest land-based animal production industry in the world, with around 70 billion broilers slaughtered each year (Butterworth, 2021).

In 1920, for a broiler to reach the weight of 1,500 g, it took 120 days, 44 days in 1980 and only 33 days in 1998 (GAA Albers & Ir. A. Groot, 1998). Since 2005, it is possible for broilers to reach between 1,700 g and 2,200 g of live weight after only 28 days of rearing and to more than 3,500 g in only 56 days of rearing if and only if the appropriate breeding conditions are respected (Zuidhof et al., 2014). In other words, the live weight at 6 weeks of the animals has been multiplied by 3 in 50 years (from 1 to 3 kg) and the net yields by 1.7 in 30 years (Berri & Jehl, 2001).

Over the years, it is therefore obvious that broilers have experienced a huge improvement in their productivity, thanks to the simultaneous progress of genetics, nutrition, breeding methods and veterinary medicine. To put it simply, the productivity of broilers has increased in recent years largely thanks to the various scientific research

carried out in the field. In other words, without advances in scientific research, none of its results would have been possible.

Since each discovery of scientific research is only the continuation of past results and experiments, this study was initiated with the aim of taking stock of the direction of research in broiler farming over the last decade. Understanding the direction of research at the level of broiler farming will allow us to look back on the progress already made, but also to highlight the future challenges for efficient, sustainable and even more environmentally friendly production.

Materials and methods

To carry out this study on the orientation of the Research on broiler farming Over the past ten years, the first step has been the selection of a database. The choice fell on Web of Science (WoS) rather than Scopus, PubMed or other databases because it is not a simple catalogue of academic publications. WoS is a selective, structured and balanced database, with comprehensive citation links and enhanced metadata, that meets a wide range of information purposes (Birkle et al., 2020). It is also a selective index of citations of scientific and academic publications covering journals, proceedings, books and data compilations. (Birkle et al., 2020).

The first data were obtained using the keyword "broilers" and excluding data not belonging to the last decade. In other words, only data from 2014 to 2024 on broilers were considered. As a result, more than 29,000 documents were found. Given the number of documents found, only information concerning the "type of documents published", the "Web of Science categories", the "publication journals" and the "countries" that have published on the subject were considered for the analysis of the data in the first instance.

To reduce the size of the database previously obtained, the key theme of this study was pooled with other keywords such as "genetics", "health and well-being", "antibiotics", "diseases", "behavior" and other keywords using "AND" as a Boolean operator in a second step. For example, the combinations "genetic AND broilers", "antibiotic broilers AND", etc. were used. By combining these different keywords two by two with the main theme, the data could be halved in some cases and more in others. However, to filter the data as much as possible, to obtain precise documents on the different keywords used, two additional filters were used. Indeed, the keywords used should be found in the "Title" as well as in the "Author's keywords".

For the analysis of the data in this specific case, only the top 50 most referenced and cited studies, as well as the countries that have produced the most publications related to the association of the key theme and the different keywords previously mentioned were examined. No special software was used for data analysis, as on the WoS platform there are the "Analyze Results" and "Citation Report" options. These two different options alone have made a great contribution to data analysis, as they promote efficient and timely analysis of trends, areas of research, and citations.

However, it is important to note that the most cited and referenced studies are not always representative in terms of research quality. As a result, many of the research findings may not be considered in this study. At the same time, the study of about fifty studies does not allow for an in-depth study of the available literature, even if many of the studies have been repetitive. In addition, by using the filter, many documents will not be considered, but by adding the presence of the keywords used in the abstracts of the articles, it could further enlarge the literature obtained and at the same time enrich the results obtained in this study. Regarding the third part, a conclusion was drawn for this study.

Data analysis

Status of Broiler Publications from 2014 to 2024

Table 1 shows the 10 different types of documents that exist in terms of the literature available on broilers according to the Web of Science database.

Table 1. Summary of the types of documents existing on the broilers

Document Types	Record Count	% of 29 193
Article	26817	91.861
Review Article	1456	4.987
Proceeding Paper	479	1.641
Meeting Abstract	329	1.127
Book Chapters	194	0.665
Correction	138	0.473
Early Access	125	0.428
Editorial Material	55	0.188
Retracted Publication	26	0.089
Letter	20	0.069

According to Table 1, there are 29,193 documents available on broilers. Of these, 26,775 documents were published in the form of scientific articles, i.e. 91.86% of the existing documents. 1,455 documents were published in the form of review articles, i.e. 4.99% of the existing documents. The remaining documents were published as working papers, summaries of meetings, or in the form of a book and other chapters.

Scientific production by country

Table 2 presents the different countries that are most active in terms of the production of documents on topics related to broilers.

Table 2. Scientific production according to country

Countries/Regions	Record Count	% of 29 193
CHINA	5497	18.830
USA	4823	16.521
BRAZIL	2258	7.735
IRAN	2068	7.084
EGYPT	1556	5.330
PAKISTAN	1147	3.929
INDIA	1066	3.652
POLAND	1006	3.446
CANADA	991	3.395
GERMANY	978	3.350

According to Table 2, China and the United States are the countries that have distinguished themselves the most through their quantitative contribution to research related to broilers. China alone published 5,489 documents, or 18.11% of the available literature on broilers. The USA produced 4810 documents, or 16.5% of the total production. In addition, countries such as Brazil, Iran, Egypt, Pakistan, India and others have also contributed to the production of scientific papers on broilers.

Most Active Web of Science Categories

Table 3 presents the different categories within which scientific publications on broilers have been indexed in the Web of Science database.

Table 3. categories Web of Science

Web of Science Categories	Record Count	% of 29 193
Agriculture Dairy Animal Science	14511	49.707
Veterinary Sciences	7646	26.191
Food Science Technology	1913	6.553
Microbiology	1761	6.032
Zoology	1720	5.892
Agriculture Multidisciplinary	1603	5.491
Multidisciplinary Sciences	986	3.378
Biotechnology Applied Microbiology	977	3.347
Environmental Sciences	948	3.247
Biochemistry Molecular Biology	779	2.668

As regards the categories into which the scientific studies conducted on broilers were divided, it is apparent from Table 3 that almost half of the documents, i.e. 14 511 documents existing in the Web of Science database, were categorised in the section 'Agriculture Dairy Animal Science'. Apart from this category, which stood out significantly, there are also 7,646 documents that were divided into the "Veterinary Sciences" category. Other Web of science categories such as Food Science Technology, Microbiology, Zoology and Agriculture Multidisciplinary also stood out with more than 1500 documents in each of them.

The most active scientific journals

Table 4 shows the scientific journals that have published the most articles on topics related to broiler farming.
According to Table 4, journals such as "Poultry Science" and "Animals" have been the most solicited for the publication of studies conducted on broilers over the last 10 years. Each of them has more than 1,200 articles published on topics related to broilers. Journals such as the Journal of Applied Poultry Research, British Poultry Science, Brazilian Journal of Poultry Science and others individually published an average of more than 340 articles on topics related to broiler farming.

Table 4. The most productive scientific journals

Publication Titles	Record Count	% of 29 193
POULTRY SCIENCE	3927	13.452
ANIMALS	1244	4.261
JOURNAL OF APPLIED POULTRY RESEARCH	658	2.254
BRITISH POULTRY SCIENCE	575	1.970
BRAZILIAN JOURNAL OF POULTRY SCIENCE	559	1.915
FRONTIERS IN VETERINARY SCIENCE	455	1.559
JOURNAL OF ANIMAL SCIENCE	448	1.535
PLOS ONE	424	1.452
JOURNAL OF ANIMAL PHYSIOLOGY AND ANIMAL NUTRITION	396	1.356
ANIMAL FEED SCIENCE AND TECHNOLOGY	377	1.291

The most productive countries in terms of publishing scientific papers in the field of genetics at the broiler level

Figure 1 shows the 10 countries that have published the most literature in the field of genetics for the optimization of broiler farming. According to Figure 1, on genetic issues related to broilers, a total of 2,079 documents are available on the Web of Science database. In addition, the USA with 415 documents and China with 399 documents to their credit are the countries that have published the most articles on this topic over the last decade.

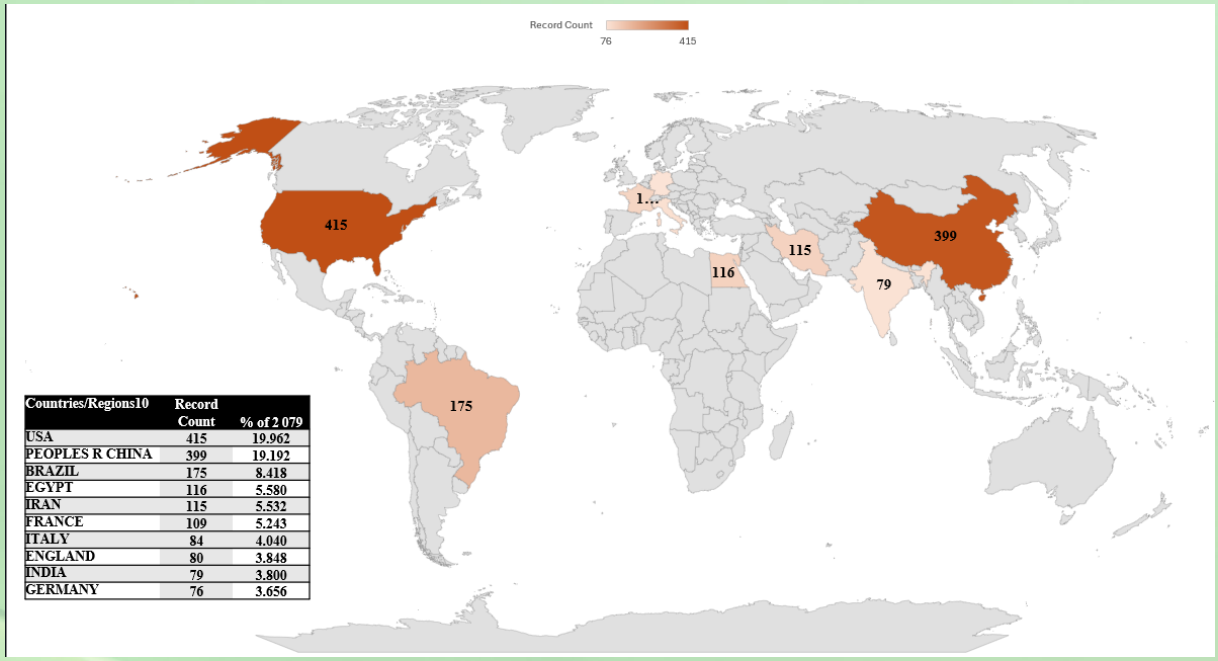

Figure 1. Most productive countries in terms of documents in the genetics sector

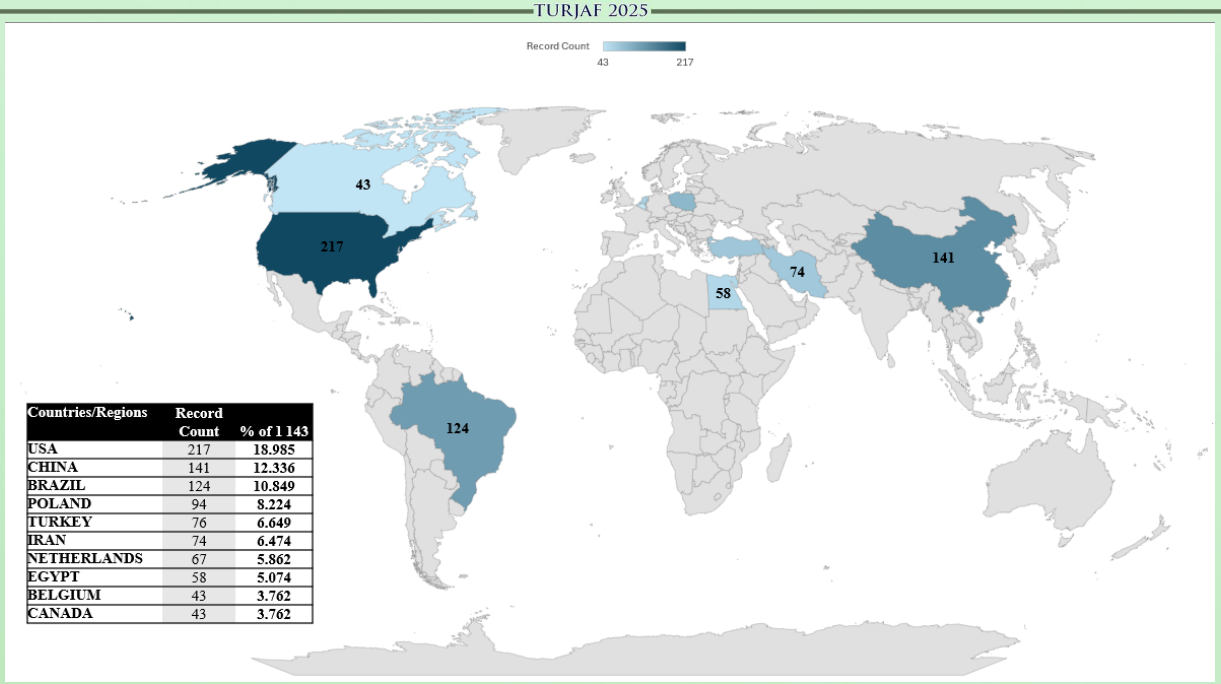
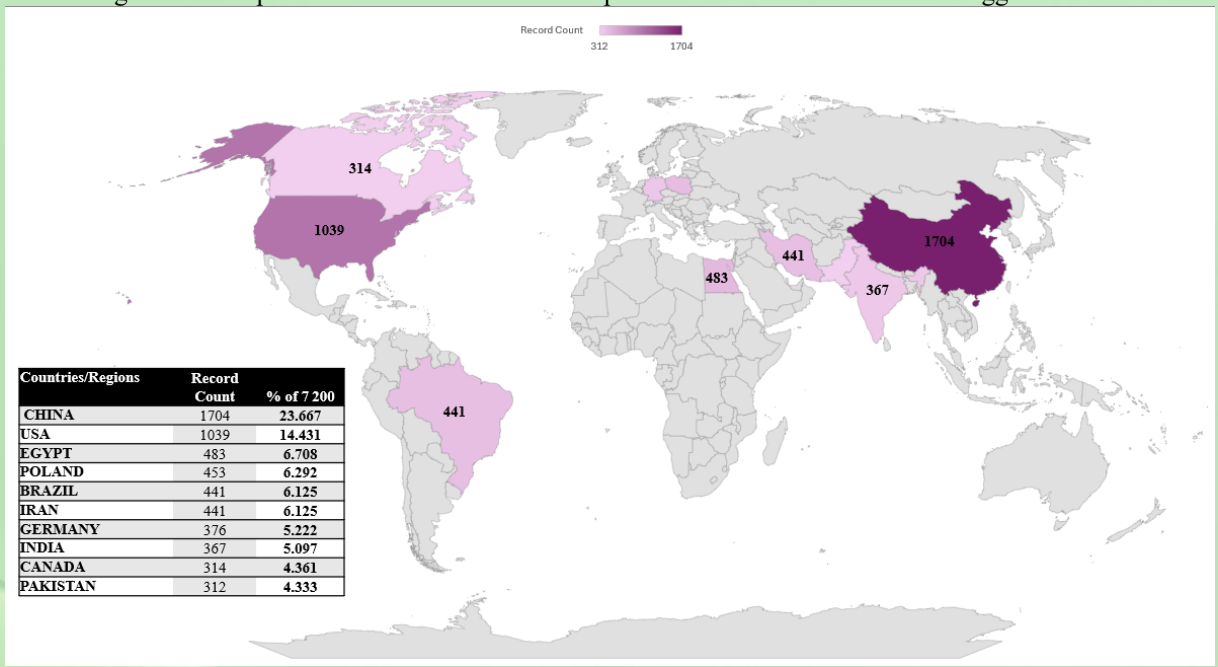


The most productive countries in terms of scientific publications in the field of egg incubation at the broiler level

Figure 2 shows the 10 countries that have published the most papers on research related to the incubation of breeding eggs for the optimization of broiler farming.

On WoS, a total of 1,143 documents are available regarding the work carried out by broiler researchers in the field of egg incubation of broiler breeding females over the last ten years. The USA, China and Brazil stood out through the number of publications they each made in this specific field. Each of these countries has published more than 120 documents. Turkey and Poland follow with more than 70 documents published per country.



The most productive countries in terms of the production of documents in the broiler nutrition sector

Figure 3 shows the 10 countries that have published the most nutrition papers for the optimization of broiler farming. From 2014 to 2024, the broiler nutrition sector is the area in which researchers have invested the most. Indeed, more than 7,000 documents have been produced worldwide on this theme related to broilers. In this area of research, China, the USA, Egypt, Poland and Brazil alone have produced more than 50% of the available literature in the field of broiler nutrition.

Countries/Regions	Record Count	% of 1 143
USA	217	18.985
CHINA	141	12.336
BRAZIL	124	10.849
POLAND	94	8.224

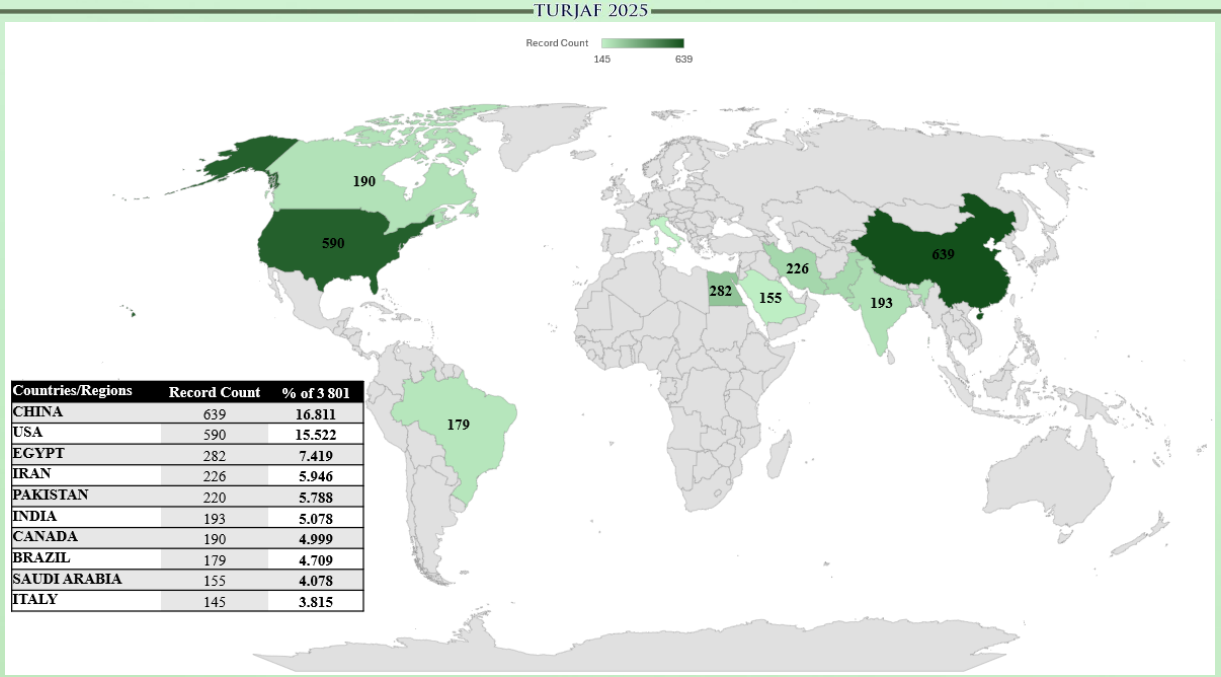
Figure 3. Most productive countries in terms of publications in the field of broiler nutrition



The most productive countries in terms of publications of scientific papers on antibiotics in broiler farming

Figure 4 shows the 10 countries that have published the most papers on the topic of antibiotics in broiler farming. According to the Web of Science database, nearly 4,000 documents are available on research on the use of antibiotics in broiler farming. China, the USA, Egypt, Iran and Pakistan alone have produced more than half of the literature available on the platform. China and the USA produced 639 and 590 documents respectively related to this theme. From this figure, it emerges that Italy is the country to have produced the fewest documents on this theme. Indeed, 145 documents are available to his credit.

The most productive countries in the production of scientific papers related to broiler diseases

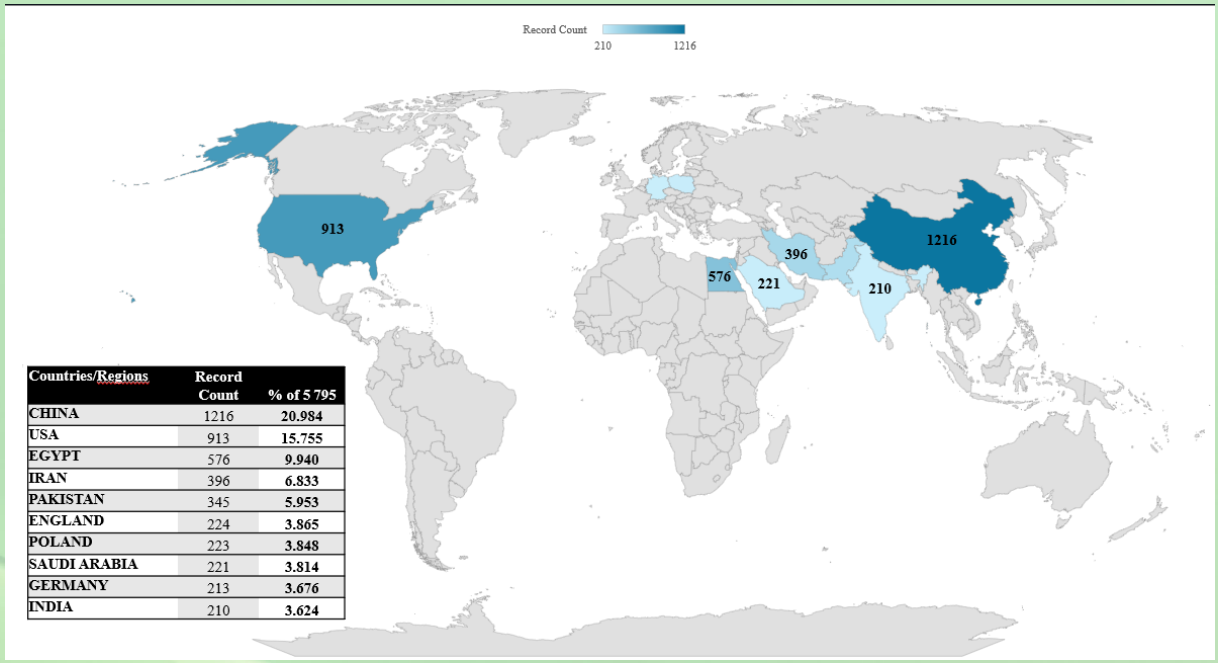


Figure 5 shows the 10 countries that have published the most papers on research on broiler diseases over the past 10 years.

More than 5,000 documents are available on this theme and China, the USA and Egypt are the countries that have produced the most documents. China produced 20% and the USA produced 15% of the literature available on WoS on topics related to diseases in the broiler farming sector.

Countries/Regions	Record Count	% of 3 801
CHINA	639	16.811
USA	590	15.522

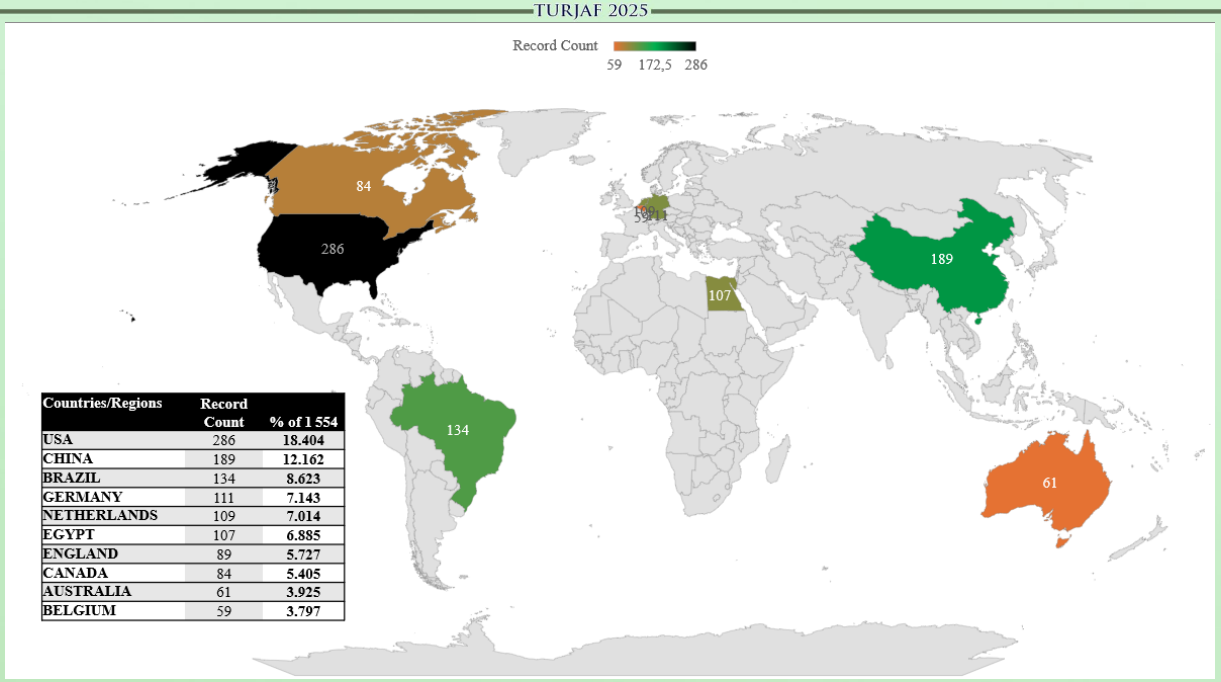
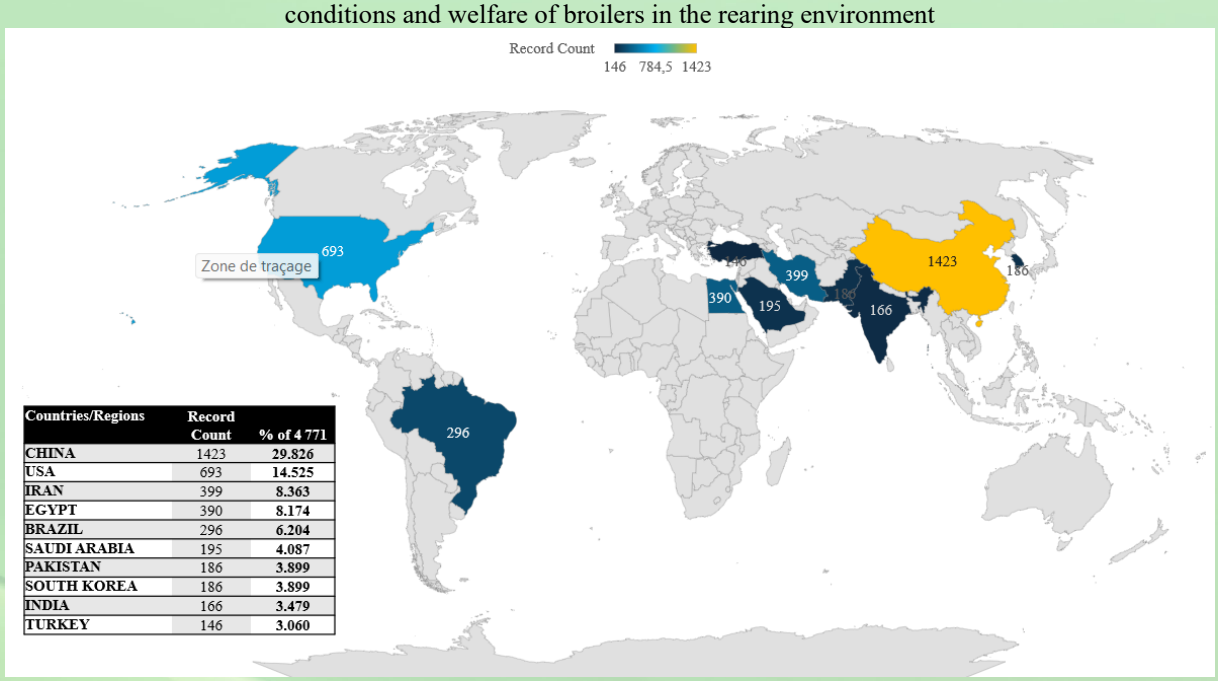
Figure 5. Most productive countries in terms of publication of papers on broiler diseases



The most productive countries in terms of scientific publications on the theme: behavior, breeding conditions and welfare of broilers in the rearing environment

Figure 6 shows the 10 countries that have published the most scientific papers on research on the behavior, rearing conditions and welfare of broilers in the rearing environment over the past 10 years.

From this figure, it emerges that the USA is also at the top of other countries in terms of the production of scientific documents on the theme, breeding conditions and welfare of broilers in the rearing environment over the last 10 years. Out of 1554 documents, the USA produced 286 documents, or 18% of the total production. China and Brazil produced 189 and 134 papers respectively, i.e. 12.16% and 8.6% of the available literature on the subject, rearing conditions and welfare of broilers in the rearing environment, ranking them second and third after the USA.



The most productive countries in terms of producing scientific papers on the topic of stress on broilers in livestock farming

Figure 7 shows the 10 countries that have published the most scientific papers on research on the topic of broiler stress in the rearing environment over the past 10 years.

Countries/Regions	Record Count	% of 1 554
USA	286	18.404
CHINA	189	12.162
BRAZIL	134	8.623

BRAZIL	296	6.204
SAUDI ARABIA	195	4.087
PAKISTAN	186	3.899
SOUTH KOREA	186	3.899
INDIA	166	3.479
TURKEY	146	3.060

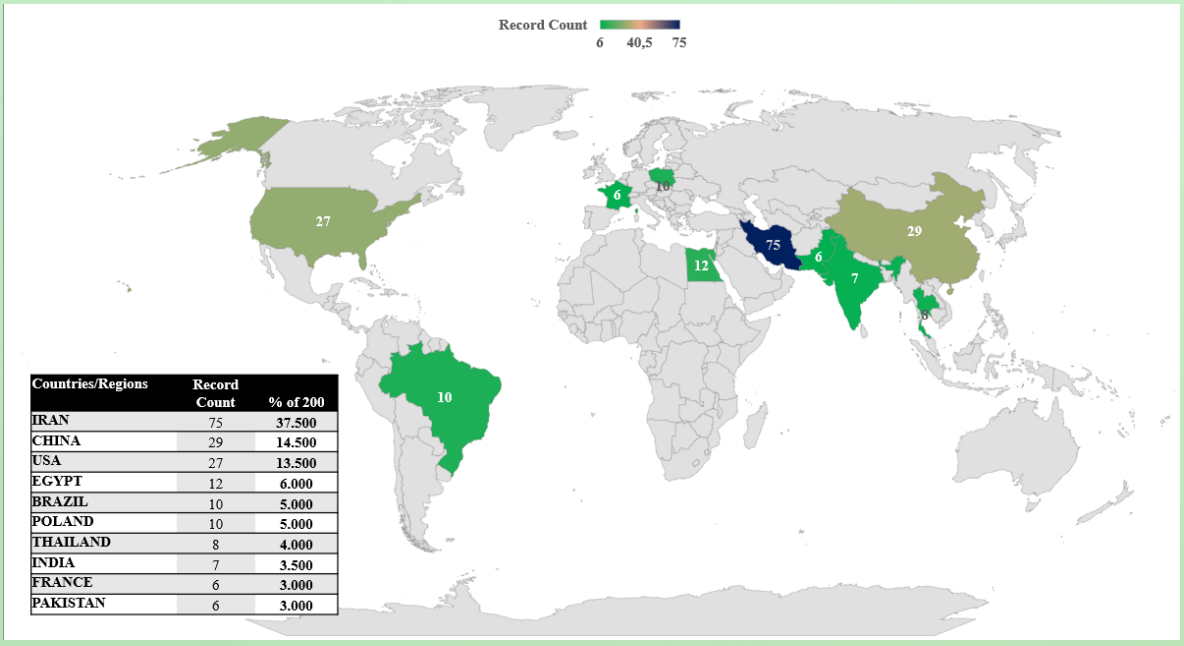
Figure 7. Productive countries in terms of scientific publications on stress on broilers in the rearing environment

According to Figure 7, more than 4,500 documents are available on Web of Science about stress on broilers on farms. China, the USA and Iran are the countries that have published more than 50% of the available literature. China alone produced 1,423 documents, or 29.8% of the available documents on stress, putting it at the top of the ranking. In this figure, Turkey occupies the 10th position in the ranking with a total of 146 published documents.

The most productive countries in terms of scientific publications on research carried out on the topic of broiler breeding rooster semen

Figure 8 shows the 10 countries that have published the most scientific papers in terms of research on broiler breeding semen over the past 10 years.

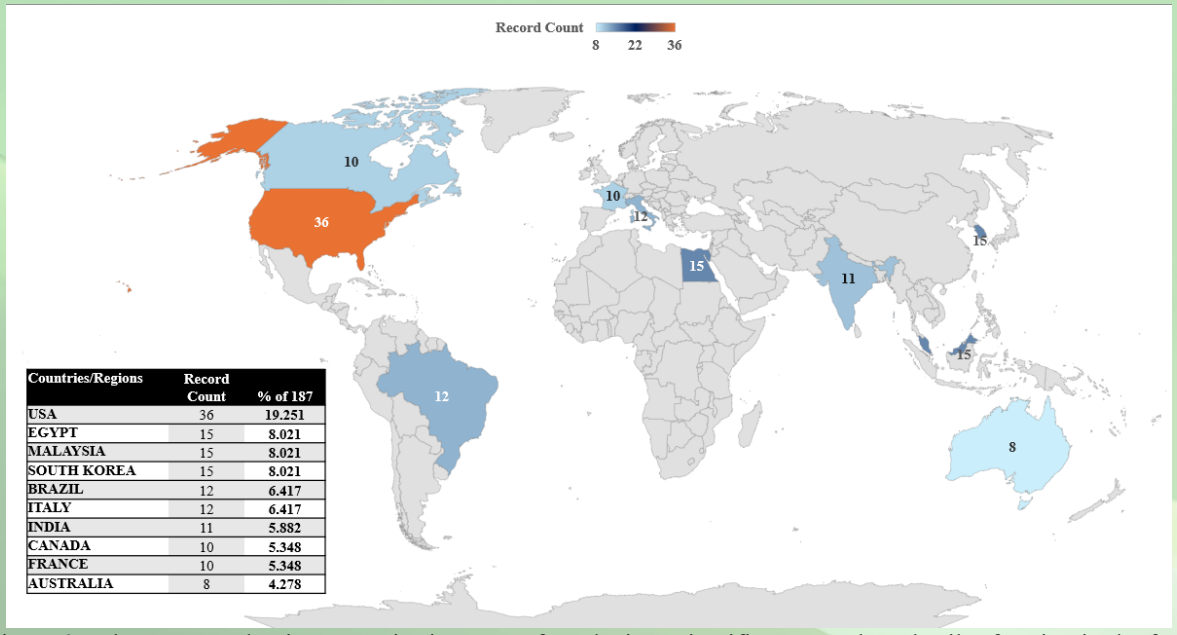
According to Figure 8, there are less than 250 articles available on the topic of semen. It is therefore obvious that this field of research within broiler farming is still quite recent and needs to be further developed. Iran is the country that has produced the most articles on this topic with a total of 75 documents published, i.e. 37.5% of the total production. It is followed by China and the United States, which have produced 29 and 27 documents on this theme respectively.



On Web of Science, less than 200 documents related to broiler production in the face of the challenge of climate change are available. This lack of literature underlines the emerging nature of this issue for the poultry industry. Of the 187 documents available, the USA is the country with the most publications with 36 documents to its credit. It is followed by Egypt and Malaysia respectively.

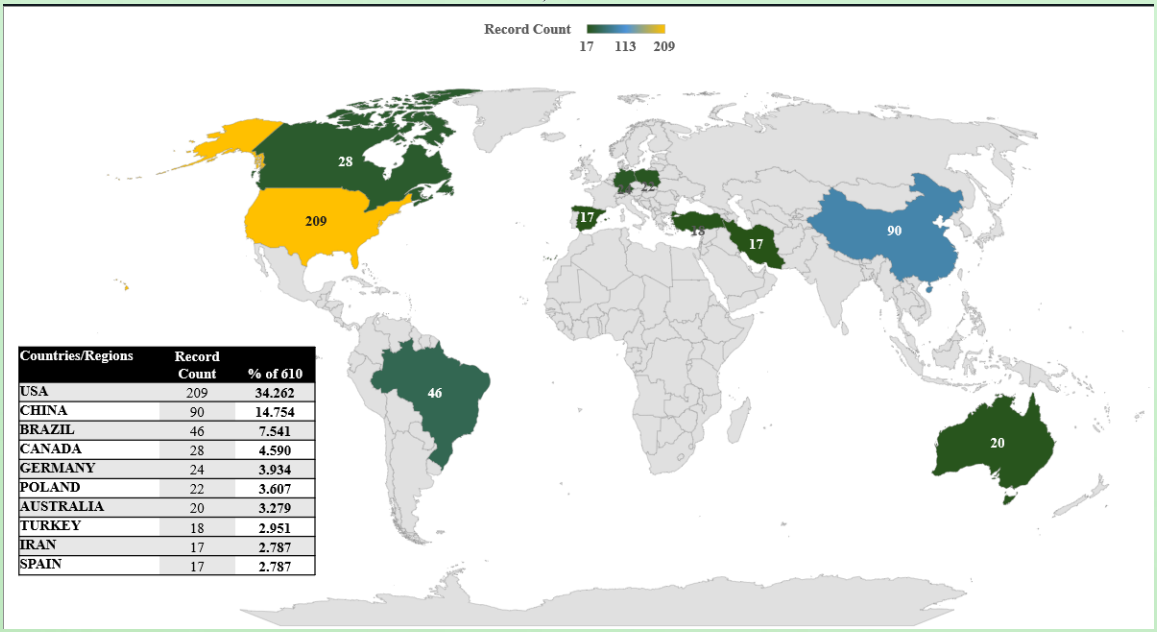
The most productive countries in terms of the production of documents regarding effluent management and greenhouse gas reduction in broiler farming

Figure 10 shows the 10 countries that have published the most scientific research papers on the topics of effluent management and greenhouse gas reduction in broiler farming over the past 10 years.



The most productive countries in terms of producing scientific papers about broiler farming in the face of the challenge of climate change

Figure 9 shows the 10 countries that have published the most scientific papers about broiler farming in the face of the challenge of climate change over the past 10 years.



Countries/Regions	Record Count	% of 200

IRAN	17	2.787
SPAIN	17	2.787

Figure 10 : The most productive countries in terms of producing documents on effluent management and greenhouse gas reduction

According to Figure 10, more than 600 papers were published in different journals from 2014 to 2024 in terms of available documents on the topics of manure management and greenhouse gas reduction in broiler farming. Of these 610 documents available, more than a third of the documents, i.e. 209 documents, were published by the United States, followed by China with 90 documents and Brazil with 46 published documents. These three countries have once again produced more than 50% of the available literature.

Results and discussions of the direction of broiler rearing research during 2014 to 2024

Genetics

Research carried out over the last 60 years on broilers through genetic selection has resulted in rapid growth rates, increased meat yield and a significant reduction in the age of slaughter, the amount of feed and the energy required to raise these birds (Bradshaw et al., 2002). Unfortunately, these scientific advances have been achieved without considering the welfare of poultry. Indeed, the rapid growth rate of broilers is closely linked to cardiovascular diseases in poultry, thus causing mortality from sudden death syndrome and ascites, leg disorders and bone deformities leading to leg weakness, lameness and poor locomotor activity (Bessei, 2006).

From 2014 to 2024, research in the field of genetics focused on several key areas, including improving growth and feed efficiency, as well as improving meat quality, this time with poultry welfare in mind (Bailey et al., 2015; Gratta et al., 2019; Hartcher & Lum, 2020). With regard to improving feed efficiency, some research has tried to identify candidate genes, in particular AGK and GTF2I, and QTL (Quantitative Trait Loci) associated with feed efficiency associated with traits such as RFI (Residual Feed Intake) and FCR (Feed Conversion Ratio) (Chen et al., 2021; Shah et al., 2016). Genomic selection studies have been conducted with the goal of improving trait selection practices and accuracy (Sell-Kubiak et al., 2017).

Since muscular myopathies (white streaks and woody breasts) have been observed in broilers in recent years, various studies were carried out between 2014 and 2024 to understand and limit their appearance in broiler meat. At the genetic level, the studies conducted have made it possible to explore the genetic basis of myopathies in order to identify the molecular mechanisms involved (Gratta et al., 2019; Lake et al., 2021). In addition, as animal welfare is also a topical issue, research in the field of genetics related to broilers has examined the negative impacts of intensive selection (locomotor problems, metabolic diseases, etc.) on broilers with the aim of finding palliative solutions (Hocking, 2014). Finally, research has also been carried out on genetic diversity and antimicrobial resistance in certain pathogens, including *Campylobacter*and*Salmonella* with the sole aim of controlling the epidemiology of these bacteria while developing strategies to better control infections (Vidal et al., 2016; Ramires et al., 2020; Mughini-Gras et al., 2021).

Egg Incubation

Egg incubation has also been an area in which researchers have had to conduct studies over the past ten years. Research has focused on optimizing environmental conditions to improve embryo development, chick quality, post-hatch growth and bird welfare. Studies have explored the effect of incubation temperature on embryo

development. It has been noted that a temperature of 37.8°C is the optimal temperature to ensure perfect development of broiler chick embryos. Also, slight temperature variations could also allow better embryo development. Other studies have shown that temperatures that are too low significantly slow down embryonic development, while temperatures that are too high speed up embryonic development. These temperature variations can cause many malformations, abnormalities in the legs and can affect the development of long bones in chicks (Afsarian et al., 2018; Maatjens et al., 2016; Oznurlu et al., 2016; Wijnen et al., 2020).

At the same time, exposure to light during incubation has been the subject of research by some researchers to study the impact of this process on the metabolism, muscle growth and immunity of the immune system. Chicks. It has been noted that light, whether red, white or blue in color, does not affect embryonic mortality, hatching time, hatching and even less the quality of the chicks obtained. However, exposure of eggs to light could have a negative effect on the immunity and energy metabolism of broiler embryos (Archer, 2017; X. Li et al., 2021). In addition, research on the in ovo injection of nutrients, amino acids or prebiotics during incubation has made it possible to understand the positive effect of this practice on the development of broiler embryos. This practice also serves to strengthen and improve the expression of genes related to growth (Elnesr et al., 2019; Elwan et al., 2019; Stadnicka et al., 2020).

In addition, much other research has been done on egg storage time, types of incubators, moisture management, and factors (age of the parental flock, ventilation and carbon dioxide concentration**)** that can affect chick hatching (Şahan et al., 2014; Damaziak et al., 2018; Okur et al., 2018; H.T. Meteyake et al., 2020; Mesquita et al., 2021; Biesek et al., 2023).

Broiler Nutrition, Growth Performance and Meat Quality

In terms of the direction of research in this specific area, it should be noted that the studies have been directed towards several key areas, the main ones being the optimization of gut health, growth performance and meat quality through the strategic use of feed additives. These various studies have made it possible to understand that feed additives such as probiotics, phytogenics and exogenous enzymes (xylanase, glucanase and protease) have beneficial effects on the intestinal health of broilers (Cho et al., 2014; Sadeghi et al., 2015; Hafeez et al., 2016; Munyaka et al., 2016; Amerah et al., 2017). They have a positive effect on the intestinal microflora, the digestibility of nutrients and participate in the reduction of potentially pathogenic enterobacteriaceae (Munyaka et al., 2016). According to studies, phytogenics containing essential oils based on thyme and star anise in particular optimize the weight gain and feed conversion ratio of chickens, while reducing lipid oxidation and improving the meat quality of broilers (Starčević et al., 2015). Similar results have also been obtained by substituting phytogenics by the enzyme xylanase (W.-C. Liu & Kim, 2017).

At the same time, other studies have shown that the reduction of crude protein content in broiler feeds combined with an amino acid profile can optimize the sustainability of broiler production without compromising their performance (Belloir et al., 2017). On the one hand, the use of blubber from black soldier fly larvae (*Hermetia illucens*) in broiler feeding have also been the subject of research (Cullere et al., 2019).

On the other hand, in order to find an alternative to the soy proteins used in the feed of broilers, research has been carried out to analyze the impact of the use of insect proteins on the environment, on the growth performance of broilers as well as on the quality of broiler meat (Pieterse et al., 2019; Vauterin et al., 2021). Finally, research has focused on the factors contributing to myopathies such as gender, diet and genetics, while focusing on antioxidant strategies to be implemented to limit muscle degeneration (Trocino et al., 2015; Radaelli et al., 2017).

Antibiotics

Since the ban on the use of antibiotics as growth promoters in animal feed (PGAs) by the European Union in 2006 (Castanon, 2007), the poultry industry has faced enormous challenges. Since then, a lot of research has been initiated with the aim of looking for palliative solutions to the use of antibiotics in the poultry industry. Research carried out over the last decades (2014-2024) has also been oriented in this direction, and studies on organic acids as feed additives that can be used to improve the performance of broilers have been carried out (Polycarpo et al., 2017; Mehdi et al., 2018).

Other studies on probiotics include *Bacillus subtilis* and *Saccharomyces cerevisiae* as substitutes for antibiotics for the improvement of growth performance and gut health of broilers were also carried out (T. He et al., 2019). Similarly, studies on phytogenics have been carried out (Abudabos et al., 2016) given their antioxidant status and the immunity it grants to poultry when incorporated into their feed. Research on essential oils has also been carried out with the aim of evaluating their antimicrobial activity as a potential substitute for antibiotics (Y. Liu et al., 2017; Fancher et al., 2020).

Other studies have focused on assessing the economic and zootechnical impact of whether or not the use of PGAs in broiler feed is discontinued, while monitoring antibiotic resistance by pathogens (Maria Cardinal et al., 2019; Roth et al., 2019). On the environmental side, the studies carried out focused on the persistence of antibiotics in soil and slurry and their ability to pollute the environment (Ho et al., 2014; L.-Y. He et al., 2014; Berendsen et al., 2018).

Diseases

Apart from genetics, nutrition, and improving the quality of meat, research over the last ten years in the field of broiler breeding has also been oriented towards the field of avian diseases. These studies were conducted with the goal of understanding, preventing and controlling infectious and metabolic diseases that can occur in broiler farming. Some research has focused on Gumboro disease, infectious bronchitis, Newcastle disease, necrotic enteritis and woody chest disease.

As far as Gumboro disease is concerned, studies have categorized viral strains, evaluated the effectiveness of vaccines and understood the evolution of the said virus (Kurukulasuriya et al., 2017; Yilmaz et al., 2019). Research focused on Newcastle disease has been used to optimize vaccination regimens and reduce viral shedding through the use of inactivated vaccines (Sattar et al., 2016; Sultan et al., 2021). For research related to infectious bronchitis, the latter focused on the molecular genotyping of the infectious bronchitis virus as well as on the comparison of the pathogenicity of the available strains (Chacón et al., 2014; Haji-Abdolvahab et al., 2019).

Studies conducted on necrotic enteritis have made it possible to measure the occurrence of this disease and production performance in broiler farms (Silva et al., 2015; Kaldhusdal et al., 2016). Other studies have examined the role of *Clostridium perfringens* in necrotic enteritis and also seek to understand the factors that can predispose to this disease in broilers (Caekebeke et al., 2021). Woody chest disease, on the other hand, has been genomic-studied, to identify the genes and metabolic processes involved (Papah et al., 2018; Brothers et al., 2019).

Behavior, rearing conditions and welfare of broilers

Research from 2014 to 2024 also focused on improving broiler farming conditions with a view to promoting natural behaviors and reducing the stress experienced by poultry. A few studies have explored the effect of stocking density on broiler behavior (H. Ma et al., 2020; Van Der Eijk et al., 2022). These studies have made it possible to understand that low density can help reduce stress on birds and encourage locomotion and foraging behaviors while optimizing meat quality.

In order to encourage positive behaviour while reducing heat stress, environmental conditions (temperature, humidity, light, noise, etc.) as well as the enrichment of the broilers' environment by setting up perches, pecking objects and organic bedding were studied (Yngvesson et al., 2017; Bergmann et al., 2017; Çavuşoğlu & Petek, 2019; Lucena et al., 2020; Fidan et al., 2020; Bai et al., 2023).

Other studies have been conducted to understand how specific behaviors such as grooming, resting, feeding and others may be affected by rearing conditions in order to serve as an indicator of well-being (Bergmann et al., 2017; Riber et al., 2021). Also with the aim of collecting accurate information on the behavior of poultry, research has been carried out using new technologies such as computer vision and the use of electronic sensors (Lucena et al., 2020; N. Li et al., 2020; Bai et al., 2023; G. Li et al., 2023). Finally, other research has examined the impact of transport and the use of electronic feeding systems on stress and feed efficiency (Fu et al., 2022; Werner et al., 2023).

Stress

Given the major damage caused by heat stress in the poultry industry, research from 2014 to 2024 also focused on the subject. Research on stress in broiler rearing has focused on identifying and mitigating major stressors such as heat stress, density stress and immunological stress. As far as heat stress is concerned, because broilers do not have a sweat gland and have a high metabolism and more or less thick plumage, they are particularly vulnerable to this type of stress (Z. H. Song et al., 2018).

Studies have therefore explored the impacts of heat stress on the intestinal morphology, microbiota and meat quality of broilers and have evaluated feeding strategies based on the use of prebiotics such as mannan-oligosaccharides (MOS) (Cheng et al., 2019), probiotics (Al-Fataftah & Abdelqader, 2014; J. Song et al., 2014), postbiotics (Humam et al., 2019), curcumin (J. F. Zhang et al., 2018), resveratol (C. Zhang et al., 2017), betaine (S. He et al., 2015; W. Liu et al., 2019) to strengthen antioxidant status and the intestinal barrier to mitigate the negative effects of heat stress on birds. Research on immunological stress has been addressed through the analysis of immune responses and the use of immunostimulants such as astragalus polysaccharides (APS) (L. Liu et al., 2015).

As for the stress related to stocking density, studies have analyzed the effects of stocking density on the growth and welfare of broilers while taking into account interactions with heat stress (Cengiz et al., 2015; Goo et al., 2019). Since heat stress also affects meat quality, causing color changes, increased water loss and changes in muscle metabolism, studies are seeking to understand the molecular mechanisms by which heat stress deteriorates meat quality while identifying strategies that can help mitigate these effects (Lu et al., 2017; Awad et al., 2020; B. Ma et al., 2021).

Finally, genetics tries to identify the differences in resistance to existing heat stress between different breeds and strains of broilers. (Sahin et al., 2016; Y. Xu et al., 2018; Awad et al., 2020). In addition, genetic selection studies are seeking to identify genetic markers associated with stress tolerance in order to use them to optimize stress resistance in broilers (Rimoldi et al., 2015).

Sperm

The quality of the sperm of breeding roosters plays a vital role in broiler farming, as it directly impacts the fertility, hatching rate and productivity of the chickens. Given its importance, research from 2014 to 2024 was much more focused on optimizing sperm quality by using feed additives in the diet of breeding roosters. Other research has investigated the environmental and biological factors that can negatively impact on the fertility of breeding animals. As dietary supplements, it was the use of ellagic acid (Najafi et al., 2019), polyunsaturated fatty acids (PUFAs) (Teymouri Zadeh et al., 2020), organic selenium and selenium nanoparticles (SeNPS) (Asghari-Moghadam & Mehri, 2024). These studies show that these feed additives optimize the viability, motility and antioxidant parameters of the sperm of breeding roosters while reducing oxidative damage (Abbaspour et al., 2020).

In addition, studies have conducted research on the effect of bacteria on sperm motility. Only Escherichia coli bacteria producing extended-spectrum beta-lactamases (ESBL) were considered. From these studies, it appears that the impact that these bacteria have on the motility of the sperm of breeding roosters varies according to the strains (Mezhoud et al., 2015). In addition, studies on the intake of noisy protein (CP) in the diet of breeding roosters have also been performed. This research has shown that a moderate reduction in crude protein levels in the diet of breeding roosters does not really affect sperm quality. However, it has been noted that an increase in the level of crude protein in the diet of breeding roosters at the end of the cycle can improve their fertility (Graaf et al., 2019).

Climate change

Climate change has a direct impact on poultry production, including bird growth, egg production and the overall health of animals. Given heat waves, a decrease in feed consumption by animals as well as an increase in the mortality rate of the flock can thus cause severe economic losses to the poultry industry (Mn et al., 2024). Over the past 10 years they have focused their studies on the search for strategies that can allow birds to adapt to climate change. On the other hand, researchers have conducted studies to develop strategies that can mitigate the effects of climate change on poultry for much more sustainable production.

For adaptation strategies, the researchers focused on optimizing housing systems. The results of these studies revealed that improving broiler housing systems would help maintain an optimal thermal environment for good production. For this purpose, efficient ventilation, efficient cooling mechanisms and the most adequate thermal insulation should be added to broiler housing (Mn et al., 2024; Oke et al., 2024). Other studies have focused on optimizing diets, including supplementing broiler feed with antioxidants to reduce the effects of heat stress on birds. At the same time, the use of animal fat to improve energy intake in poultry feed has also been the subject of research (Kpomasse et al., 2021; Mn et al., 2024). Finally, research in genetic selection tends to select poultry that can withstand heat and resist diseases (Kumar et al., 2021).

About strategies to mitigate the effects of climate change on broiler production, research has been directed towards climate modelling and direct cooling systems to assess and mitigate the impact of climate change on production costs, performance and poultry welfare. The objective of these studies is to anticipate the challenges posed by climate change on the poultry industry in order to adapt appropriate management practices (Lourençoni et al., 2019; Mn et al., 2024; Oke et al., 2024).

Effluent management and greenhouse gas reduction

To reduce the environmental impact of livestock farming, the management of livestock manure is essential. As a result, for the preservation of the environment and to better use the effluents from broiler farming, several studies have been carried out over the last ten years. Some research has focused on studying the composition of manure according to age and the diets to which poultry have been subjected in order to understand how feed may influence manure quality and ammonia emissions (Van Emous et al., 2019). A significant portion of the research conducted over the past decade has been aimed at reducing ammonia emissions from broiler manure by manipulating the amount of crude protein in the feed and using urease inhibitors.

Other research studies manure in order to use it as an agricultural amendment to optimize soil fertility (Lima et al., 2014; Keskinen et al., 2019). The composting of broiler manure was also studied with a focus on monitoring antibiotic residues in order to understand its impact on antibiotic degradation and the reduction of environmental risks (Wang et al., 2022; X. Xu et al., 2022). A study compared four different types of broiler manure treatment, including storage, composting, anaerobic digestion and biochar production, to assess greenhouse gas emissions. The study shows that anaerobic digestion and pyrolysis appear to be the most promising treatments for reducing greenhouse gases in the environment and producing useful resources such as biogas or biochar (Kreidenweis et al., 2021). Further studies have shown that adding substances such as magnesium sulphate (MgSO4.7H2O) to bedding is an effective technique for reducing ammonia (NH3) and nitrous oxide ($N_{2O)\ in\ poultry\ houses}$ (Pereira et al., 2019).

Conclusion

This study analyzed the direction of research carried out in broiler farming over the last ten years using the Web of Science database. This analysis made it possible to understand that many studies have been carried out on key themes such as genetics, egg incubation, nutrition, antibiotic use, avian diseases, bird behavior and the level of stress suffered by broilers in the farming environment. On the other hand, about topics relating to sperm quality, climate change, effluent management and the reduction of greenhouse gases, the analysis revealed that these themes are still little explored. It is therefore obvious that future research will focus much more on these topics regarding broiler farming while highlighting bird welfare and meat quality. However, the overall goal of the 2014 to 2024 research on broilers was to promote farming practices that optimize animal welfare, natural behaviors, and productivity, considering the complex interactions between the environment, genetics, and management practices.

Abstract

Fish oil, due to its high content of polyunsaturated fatty acids (PUFA), is extremely sensitive to oxidation, which can negatively affect its nutritional quality and shelf life. In this study, the effects of Satureja montana (SMont EO) essential oil on fish oil oxidation were investigated. Within the scope of the experiment, different concentrations (100, 200, 400, 800 ppm) of Satureja montana essential oil were added to fish oils, and the commercial antioxidant BHT (200 ppm) was used as a positive control. The experimental groups were subjected to accelerated oxidation for 96 hours under 55°C temperature, 70% humidity, and 7000 lux illumination. Oxidation levels were determined by measuring peroxide value (PV) and malondialdehyde (MDA), and the obtained data were statistically analyzed using one-way ANOVA and Tukey's test. According to the GC-MS analysis results, Satureja montana essential oil contains the highest amounts of carvacrol (42.62%), γ-terpinene (12.44%), and p-cymene (14.09%). It has been reported in the literature that carvacrol is a strong free radical scavenger, γ-terpinene can prevent lipid peroxidation, and p-cymene plays an important role in combating oxidative stress. According to the peroxide value measurements, it was determined that the group containing 400 ppm Satureja montana oil had the lowest oxidation level. The peroxide value of the 400 ppm dose was determined to be 16.08 meq O_2/kg, which is similar to the commercial antioxidant BHT (25.48 meq O_2/kg). MDA levels were also measured at the lowest level in the 400 ppm essential oil group, but a slight increase was observed at the 800 ppm dose. The results indicate that Satureja montana essential oil is an effective natural antioxidant in preventing fish oil oxidation. It has been determined that a concentration of 400 ppm provides the best oxidative stability. Compared to the commercial antioxidant BHT, Satureja montana essential oil provided a similar level of oxidative protection, therefore it can be considered as an alternative to synthetic antioxidants in aquaculture feeds.

Key Words: *Fish oil oxidation, Satureja montana essential oil, Natural antioxidants, Peroxide value, Lipid peroxidation*

Introduction

Aquaculture is an essential sector for fulfilling the animal protein requirements of the swiftly expanding global population (Nasopoulou & Zabetakis, 2012). In this sector, fish oil provides a crucial nutritional source owing to its elevated quantity of polyunsaturated fatty acids (PUFAs). Omega-3 fatty acids (EPA and DHA) are known for their beneficial benefits on human health and are deemed critical components of feeding protocols in aquaculture (Harris, 2004; Rizliya & Mendis, 2013). Fish oil is particularly sensitive to oxidation because of its elevated levels of polyunsaturated fatty acids (Frankel, 1984).

Lipid oxidation results in the degradation of fat content via free radicals, leading to diminished food quality and modifications in flavor and odor (Shahidi & Zhong, 2010). This procedure reduces the shelf life of fish oil-containing nutrition and adversely impacts growth performance and feed efficiency in fish (Oliva-Teles et al., 2022).

Therefore, the use of antioxidants is crucial in order to avert the oxidation of fish oil. A common antioxidant in current commercial products is the synthetic compound butylated hydroxytoluene (BHT). Nevertheless, research indicates that certain synthetic antioxidants may exhibit toxic side effects and potentially detrimental effects on human and fish health over time (Wang et al., 2021).

This circumstance requires the investigation of natural antioxidant sources and the formulation of alternative treatments (Gulcin, 2020; Kesbiç, 2023). Essential oils, phenolic compounds, and terpenoids are prominent natural antioxidants due to their composition (Ben Hsouna et al., 2017). This study assessed the potential preventive effect of Satureja montana essential oil (SMont EO) on the oxidation of fish oil. SMont EO exhibits antioxidant and antibacterial properties thanks to its elevated carvacrol concentration.

(Trifan et al., 2015).

This research aims to clarify the potential advantages of including natural antioxidants into aquaculture feeds and to empirically validate the efficacy of Satureja montana essential oil as a substitute for synthetic antioxidants.

Materials and Methods

The SMont EO utilized in the study was procured from a commercial source, and the volatile component composition of the product was qualitatively analyzed using GC/MS (Kesbiç 2019).
The objective is to examine the efficacy of various concentrations of SMont EO (100 ppm, 200 ppm, 400 ppm, and 800 ppm) in inhibiting the oxidation of fish oil. To achieve this objective, fish oils from various experimental groups were subjected to accelerated oxidation conditions, and their impacts on oxidative stability were assessed by quantifying the peroxide value (PV) and malondialdehyde (MDA) levels. The study employed commercial antioxidant BHT at 200 ppm (BHT200) as the positive control, while fish oil without additions served as the negative control. To facilitate accurate comparisons and assess the quality of the oil utilized in the study, the peroxide (Kesbiç, 2023) and MDA (Okhawa et al., 1979) levels of the fresh fish oil were measured.
The rapid oxidation study was conducted under conditions of temperature, humidity, and light that would trigger oxidation. The prepared experimental groups were subjected to an accelerated oxidation process for 4 days at a temperature of 55.0±0.5°C, in a 70% humid atmosphere, and under 7000 lux illumination. Subsequently, peroxide and MDA measurements were conducted.

Results and Discussion

This study studied the effects of Satureja montana essential oil on the oxidation of fish oil and examined its antioxidant activity. The GC-MS analysis identified the three main components of the essential oil as carvacrol (42.62%), γ-terpinene (12.44%), and p-cymene (14.09%). Carvacrol has been identified as a potent free radical scavenger owing to its phenolic structure, and prior research has demonstrated its substantial effect in inhibiting lipid peroxidation (Trifan et al., 2015).
This molecule, extensively utilized as a natural antioxidant in food preservation, has also been examined as an effective agent against oxidative stress (Burt, 2004). γ-Terpinene is known for its capacity to neutralize highly reactive oxygen species (ROS), and it has been demonstrated that this characteristic enhances the oxidative stability of oils by inhibiting lipid peroxidation (Ruberto & Baratta, 2000). The p-Cymene molecule, owing to its lipophilic nature, demonstrates a protective impact on cellular membranes and inhibits oxidative degradation by disrupting free radical chain reactions (Gülçin et al., 2012). The existence of these components scientifically validates the antioxidant capacity of Satureja montana essential oil and demonstrates that the observed antioxidant activity in the study is grounded in its biochemical composition.
The peroxide values (PV) assessed across several experimental groups have yielded significant insights into the oxidative stability of the fish oil samples (Table 1).
The peroxide value in the control group was measured at 75.48 meq O_2/kg, considerably higher than that of fresh fish oil. This means that oxidation is advancing and lipid peroxidation has increased markedly. The group that administered the commercial antioxidant BHT (200 ppm) exhibits a peroxide value of 25.48 meq O_2/kg and demonstrates comparable antioxidant efficacy to the groups utilizing essential oils. The application of Satureja montana essential oil has resulted in a notable reduction in peroxide values. At a concentration of 100 ppm, the peroxide value was measured at 26.59 meq O_2/kg; at 200 ppm, it was 18.87 meq O_2/kg; and at 400 ppm, it was 16.08 meq O_2/kg. The peroxide value was lowest at a dosage of 400 ppm, indicating that this concentration provides the most efficient oxidative protection. At a concentration of 800 ppm, the peroxide value measured 22.41 meq O_2/kg, suggesting that volatile oil may demonstrate pro-oxidant activity at elevated levels. Research indicates that a concentration of 400 ppm of essential oil ensures adequate oxidative stability, however elevated doses may result in erratic oxidative effects (Kesbiç, 2023).
The study examined MDA levels to assess the evolution of oxidative stress, providing as a quantitative indication of lipid peroxidation. The control group showed the highest levels of MDA, reflecting the highest level of oxidation. The group supplied 200 ppm BHT and those obtaining 400 ppm Satureja montana essential oil exhibited the lowest MDA levels. This condition suggests that the antioxidant efficacy of the essential oil is comparable to that of BHT. It has been shown that MDA levels increased at the 800 ppm dosage, corroborating the concept that elevated doses may demonstrate a pro-oxidant impact. Some research in the literature indicate that excessive antioxidant use can negatively impact specific oxidative stress conditions (Wang et al., 2011).
This study's results demonstrate that Satureja montana essential oil serves as an excellent natural antioxidant in inhibiting the oxidative degradation of fish oil. The lowest values of peroxide and MDA were observed, particularly at a concentration of 400 ppm. In comparison to the commercial antioxidant BHT, Satureja montana essential oil offered an equivalent level of oxidative protection, suggesting that natural antioxidants may serve as viable alternatives to manufactured ones. Natural antioxidants present a substantial alternative to the deleterious effects of synthetic chemicals and confer benefits for food safety. In conclusion, Satureja montana essential oil demonstrates potent antioxidant activities attributed to its constituents carvacrol, γ-terpinene, and p-cymene, which are thought to augment oxidative stability. Research indicates that plant essential oils abundant in phenolic

components may serve as natural antioxidants in aquaculture diets. Further research is required to examine the long-term stability of these natural components under varying temperature and storage conditions.

Table 1. Peroxide values (meq O_2/kg) of experimental groups after rapid oxidation procces.

Experimental Groups	N	Mean	Standart Deviation	Grouping Information	
BHT 200	3	25,480	1,426	B	
Control	3	75,48	2,94	A

Agricultural Carbon Footprint, Environmental Pressures, and Mitigation Policies within the Framework of the Paris Climate Agreement: A Comparative Analysis of Turkey and the European Union

Bekir Ayyıldız[1], Tuğrul Yakuoğlu[2]
[1]Agricultural Economics, Yozgat Bozok University, Yozgat, Türkiye
[2]Department of Soil Science and Plant Nutrition, Yozgat Bozok University, Yozgat, Türkiye

Abstract

The agricultural sector, while a vital component of economic production and food security, is also one of the major contributors to global greenhouse gas emissions. Following the ratification of the Paris Climate Agreement, the environmental impacts of agriculture especially its carbon footprint have become critical points of analysis and policymaking. This review compares the carbon emissions, environmental pressures, and mitigation policies in agriculture between the European Union (EU) and Turkey.

The concept of a carbon footprint encompasses emissions of methane (CH_4), nitrous oxide (N_2O), and carbon dioxide (CO_2) from agricultural activities such as livestock, fertilizer use, land cultivation, and irrigation. EU member states have taken significant steps toward reducing these emissions in alignment with the Paris Agreement, notably through the Green Deal, reform of the Common Agricultural Policy (CAP), and carbon taxation. In contrast, Turkey, although it ratified the Paris Agreement in 2021, lacks an integrated national strategy for reducing agricultural emissions. Nevertheless, some promising pilot projects and organic agriculture promotion initiatives exist across regions.

This paper synthesizes findings from over 75 academic studies and official policy reports. The results demonstrate that the EU possesses a more mature framework in terms of monitoring, reporting, and carbon market instruments. For Turkey to meet its climate targets and align with EU standards, substantial investments in regulatory adaptation, climate financing mechanisms, and digital agricultural infrastructure are needed.

Ultimately, the study concludes that addressing the environmental impact of agriculture requires both regional collaboration and institutional capacity building. Enhanced cooperation between the EU and Turkey in climate-smart agriculture and emission reduction strategies would yield significant benefits for both environmental sustainability and economic competitiveness in the region.

Paris İklim Anlaşması Çerçevesinde Tarımsal Karbon Ayak İzi, Çevresel Baskılar ve Azaltım Politikaları: Türkiye ve Avrupa Birliği Karşılaştırması

Özet

Tarım sektörü, ekonomik üretimin temel bileşenlerinden biri olmasının yanı sıra küresel sera gazı emisyonlarının önemli bir kaynağıdır. Özellikle Paris İklim Anlaşması sonrasında, tarımın çevresel etkileri, karbon ayak izi ve sera gazı azaltım politikaları hem Avrupa Birliği (AB) hem de Türkiye için önemli gündem maddeleri haline gelmiştir. Bu çalışmada, Türkiye ve AB'nin tarım kaynaklı karbon salımları, çevresel baskıları ve izledikleri azaltım politikaları karşılaştırmalı olarak ele alınmıştır.

Karbon ayak izi kavramı; metan (CH_4), azot oksit (N_2O) ve karbondioksit (CO_2) gibi tarımsal faaliyetlerden salınan sera gazlarının çevresel etkilerini ölçmede önemli bir göstergedir. AB ülkeleri, özellikle 2030 karbon azaltım hedeflerine ulaşmak amacıyla Yeşil Mutabakat, Ortak Tarım Politikası (CAP) reformları ve karbon vergilendirme gibi politika araçlarını etkin bir şekilde kullanmaktadır. Türkiye ise Paris Anlaşması'nı geç onaylamış olup tarımsal karbon azaltımı konusunda henüz bütüncül bir strateji oluşturamamıştır. Ancak bazı bölgelerde başarılı pilot projeler ve organik tarımı teşvik eden uygulamalar mevcuttur.

Araştırmada, 75'in üzerinde bilimsel çalışma ve resmi politika belgesi incelenmiştir. Bulgular, AB'nin izleme, raporlama ve karbon ticaret mekanizmaları açısından daha gelişmiş bir yapıya sahip olduğunu ortaya koymaktadır. Türkiye'nin karbon yönetimi süreçlerini geliştirebilmesi için mevzuat uyumu, finansman mekanizmaları ve dijital tarım altyapılarına yatırım yapması önerilmektedir.

Sonuç olarak, tarımın çevresel etkilerini azaltmada hem bölgesel iş birlikleri hem de kurumsal kapasite artırımı önem arz etmektedir. Türkiye'nin, AB ile tarımsal karbon politikaları konusunda daha yakın entegrasyon sağlaması, hem çevresel sürdürülebilirlik hem de ekonomik rekabetçilik açısından stratejik bir zorunluluktur.

[3]Independent Researcher, Kiraz, İzmir, Türkiye, jerirugji@gmail.com

Abstract

Listeriosis is a significant foodborne illness mainly resulting from the consumption of food contaminated with *Listeria monocytogenes*. The present research aimed to comprehensively examine the growth of foodborne pathogen *Listeria monocytogenes* in readily accessible ultra-high temperature processed bovine milk, infant formula, and two commercial plant-based beverages (almond and coconut) stored at ambient temperature (25°C). Nutrient broth was used as a reference control. Beverage samples were inoculated with *Listeria monocytogenes* at approximately 9×10^7 CFU/mL. The inoculated samples were stored at 25°C and sampled on the 1, 3, 6, 24, 48 and 72 hour of incubation. The findings indicate that *Listeria monocytogenes* was capable of proliferating in all the samples reaching the highest counts on the 48th hour of the evaluation. Although that on the 48th hour of evaluation, coconut beverage had the lowest bacteria counts (7.5±0.98 CFU/mL), no statistically important differences ($P > 0.05$) in growth rates between diverse evaluated beverages was noted. At the 72-hour incubation period, infant formula exhibited the highest microbial counts, at a value of 8 logs, whereas the coconut beverage showed the lowest microbial counts at 6 logs. The obtained data indicate that all the assessed beverages could pose a considerable threat for listeriosis, and post-opening guidelines should be thoroughly evaluated.

Keywords: *Bovine milk, Plant-based beverages, Infant formula, Listeria monocytogenes*

Introduction

Milk is a biologically complex fluid with a distinctive composition that supports the growth and development of newborns. It contains a variety of bioactive compounds known to offer health benefits (Ballard et al., 2013). However, milk also serves as a significant reservoir for foodborne pathogens, including *Listeria monocytogenes* (Erol and Taşçı, 2021; Kahraman et al., 2024; Rugji and Dinçoğlu, 2022; Rugji et al., 2023). *Listeria monocytogenes* is a pathogenic microorganism responsible for foodborne illnesses, and its capacity to endure and potentially exponentiate under a variety of adverse conditions presents a substantial food safety concern (Wang et al., 2024). Although listeriosis remains relatively rare, it can lead to severe, life-threatening infections in vulnerable populations, including infants, pregnant women, the elderly, and individuals with weakened immune systems (Pal et al., 2022).

In recent years, the growing popularity of vegan diets, increasing awareness of lactose intolerance, and heightened environmental consciousness have fueled the demand for plant-based alternatives to cow's milk (Bartula et al., 2023). There has been reported that in Europe, sales increased by 49% from 2018 to 2020, reaching €3.6 billion. According to the Smart Protein report, plant-based milk leads the plant-based product market in 8 of the 11 countries studied (Anon, 2021). While commercially available plant-based beverages are typically heat-treated to ensure microbiological safety, risks persist, such as the potential for cross-contamination post-processing or the survival of spores from spore-forming microorganisms despite ultra-high temperature (UHT) treatment (Bartula et al., 2023). The nutrient-dense composition and high-water activity of these beverages provide an environment conducive to the growth and spread of *L. monocytogenes*, presenting potential food safety hazards.

This study explores how different matrices—plant-based milk alternatives, bovine milk, infant formula, and culture media—affect the growth of *Listeria monocytogenes* when stored at 25 °C.

Materials and Methods

Sources of Samples

The current dataset included four varieties of non-refrigerated UHT samples: whole bovine milk (Migros), almond (Alpro), Coconut (Alpro), Infant formula (Aptamil). Nutrient broth was used as reference control. All the samples were purchased from local store and for consistency, one brand for each beverage was selected for all experiments. Product information is provided in Table 1.

Table 1. UHT beverage composition.

100 g/mL	Bovine milk	Infant formula	Almond beverage	Coconut beverage
Fat	3.1	3.4	1.1	1.2
Carbohydrate	4.7	7.4	3.0	0.0
Protein	3	1.3	0.5	0.1
Salts	0.1	0.0	0.14	0.07

Bacterial Strain and Inoculum Preparation

Listeria monocytogenes ATCC 19115 was used in the current investigation. A loop from each cryogenic (-80°C) stock vial was initially cultured individually in nutrient broth and further maintained on trypticase soy agar (TSA) at 4 °C throughout the study. One isolated colony was transferred to 9 mL of nutrient broth and incubated at 37°C for 24 h. Culture was then sub- cultured onto TSA and incubated at 37°C for 24 h. Following incubation, the microorganism was adjusted to a 0.5 McFarland standard in 9 mL of saline solution. Serial 2-fold dilutions were prepared on saline solution to determine the initial bacterial load.

Experimental Design

Listeria monocytogenes survival was evaluated in five different matrices at 25°C for 72h. The temperature selection for this investigation was based on conditions designed to replicate ambient environments, simulating how inoculated bacteria would behave under post-thermal treatment contamination in the selected beverages. A total of 200 mL sample (Rugji et al., 2023) was inoculated with 1 mL of the prepared strain (9×10^7 CFU/mL). The inoculated samples were stored at 25°C and sampled on the 1, 3, 6, 24, 48 and 72 h of incubation. A total of 100 uL was sampled each time, was serially diluted and plated on TSA. The sampling times and total incubation were adjusted based on experimental feasibility. Experiments were conducted in two biologically independent replicates.

Data Analysis

Results are presented as the mean value ± standard deviation. Statistical analysis was conducted using GraphPad Prism version 10 (GraphPad Software Inc., La Jolla, CA, USA). P values ≤ 0.05 were regarded as statistically significant.

Results and Discussion

The maximum growth rates of *Listeria monocytogenes* at ambient temperature (25°C) were assessed and compared across bovine milk, infant formula, and plant-based, non-dairy beverages. The *Listeria* strain (*Listeria monocytogenes* ATCC 19115) chosen for this study was a standard laboratory strain frequently utilized in food safety research. In a controlled setting, the microorganism demonstrated robust growth in all the tested matrices (Figure 1). However, no statistically significant difference ($P > 0.05$) was found between the various types of beverages. The data from this study showed that *Listeria monocytogenes* was able to grow similarly in a selection of plant-based milk beverages (coconut, almond), infant formula and dairy milk, despite the significant differences in their compositions. An evaluation of bacterial counts 72 hours after incubation showed a numerical decrease; however, the levels remained high enough to pose a food safety risk (Table 2). At the 72-hour time point, the highest bacterial counts were observed in the infant formula, highlighting its significant relevance to food safety and preservation for this product category. While the counts in the plant-based beverages, almond and coconut, were lower at 6.1 and 6, respectively, these levels still represent a public health concern and should be regarded as a potential danger. Furthermore, the positive correlation values observed for the tested beverages indicate a direct relationship between the variables, suggesting that as one factor increases, the other tends to increase as well (Figure 2). The obtained data offer valuable insight into the comparable growth rate of *Listeria monocytogenes*, irrespective of the food matrix. Bartula et al. (2023) investigated the growth of various foodborne pathogens in commercial plant-based beverages and found that *Listeria* strains proliferated more rapidly in plant-based beverages than in bovine milk at both 8°C and 20°C. UHT beverages can be stored at ambient temperature for up to 12 months. Notably, the recommended post-opening storage duration for UHT bovine milk is 3 days under refrigeration, while UHT plant-based beverages can be stored for 5 days at refrigeration temperature. Thus, if these products become contaminated with *Listeria monocytogenes*, this study demonstrates that all can support rapid microbial growth if not stored at appropriate temperatures. Given that *Listeria monocytogenes* can be present on nuts and potentially enter products as a post-processing contaminant, the findings suggest that plant-based beverages may pose a considerable risk for listeriosis. Consequently, post-opening storage guidelines should be carefully reviewed in light of these results. The absence of a significant difference in growth rates between dairy and plant-based products for most of the microbes tested was unexpected, considering the differences in composition. Although plant-based beverages typically contain lower nutrient concentrations than cow's milk, they clearly supply sufficient nutrients to support similar growth rates (Bartula et al., 2023).

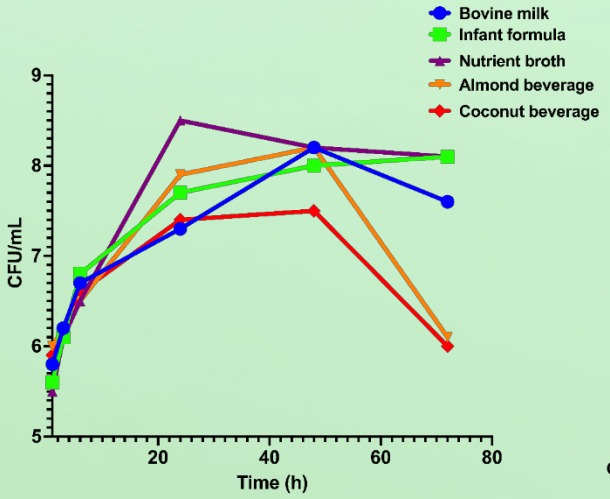

Figure 1. Growth curve of *Listeria monocytogenes* on selected beverages.

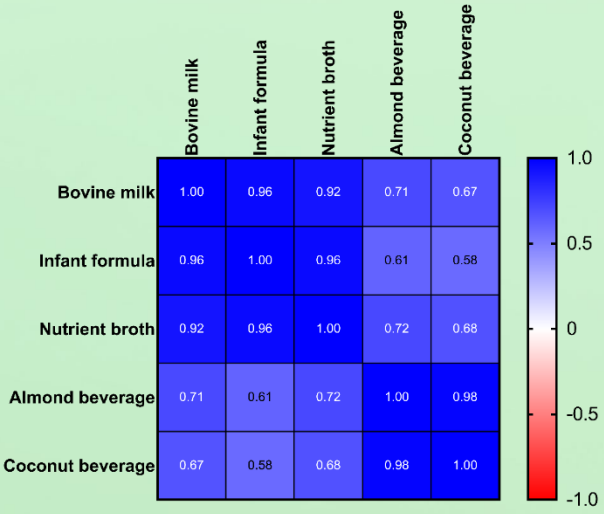

Figure 2. Pearson r correlation results.

Table 2. *Listeria monocytogenes* counts of the artificially contaminated beverages.

Time (h)	1	3	6	24	48	72
Bovine milk	5.8±0.02	6.2±0.00	6.7±0.03	7.3±0.38	8.2±0.11	7.6±0.80
Infant formula	5.6±0.19	6.1±0.17	6.8±0.02	7.7±0.76	8.0±0.49	8.1±0.87
Almond beverage	6.0±0.21	6.2±0.03	6.5±0.31	7.9±0.34	8.2±0.32	6.1±0.12
Coconut beverage	5.9±0.02	6.2±0.01	6.6±0.02	7.4±0.16	7.5±0.98	6.0±0.00
Nutrient broth	5.5±0.21	6.1±0.13	6.5±0.25	8.5±0.81	8.1±0.00	8.1±0.20

This study also emphasizes that the integration of food safety management systems and effective cleaning practices is crucial in the food industry to prevent contamination, ensure product safety, and maintain consumer health (Dinçoğlu and Rugji, 2021).

Conclusion

Overall, the findings presented in this report offer critical insights into the growth dynamics of Listeria monocytogenes, a major foodborne pathogen, across diverse matrices, including the increasingly popular plant-based beverages gaining global traction. These findings must be taken into account when evaluating the risks linked to the production and consumption of plant-based milk alternatives.

Abstract

Rhizobacteria colonize the roots of plants after being introduced to seedlings or the rhizosphere through inoculation, thereby stimulating growth. Indole-3-acetic acid (IAA), an essential phytohormone stimulates cell proliferation, growth, and enhance nutrient uptake from the soil. However, IAA has conventionally been produced by chemical synthesis, with practical limitations such as high cost of chemicals which are also not eco-friendly. Sustainability of IAA production from *Rhizobacteria* and their antifungal potential would be an alternative cost effective and natural approach to overall plant health. Isolation and screening for indole-3-acetic acid producing bacteria from plant rhizosphere was done using a chemically-defined medium and Salowisky reagent. Quantification of IAA produced by selected isolates, through submerged fermentation was estimated with a Spectrophotometer. Molecular identification of highest producer was done using standard methods while production parameters were optimized for improved IAA yield. Antifungal activity against selected pathogen was analysed with the dual culture method. Change in color to pink after addition of Salowisky reagents indicated the presence of indole-3-acetic acid. The concentrations of IAA produced from selected isolates ranged between 218.88 ± 0.00 and 393.88 ± 0.01 µg/mL. Highest IAA-producing bacteria was identified as *Pseudomonas aeruginosa* ROO1S (Accession PV123886). Optimal IAA production was obtained at 25°C (463.88 µg/mL), with 2g/L tryptophan substrate (505.13 µg/mL), tryptone (613.87 µg/mL) and mannitol (718.87 µg/mL) as nitrogen and carbon sources respectively, and 150 rpm agitation (356.38 µg/mL). Optimisation yielded 865.13 µg/mL of IAA. The extracted compound exhibited antifungal activity. Conclusively, *Pseudomonas aeruginosa* ROO1S is an IAA-producing bacteria. Optimisation increased IAA production and the compound exhibited inhibitory properties against fungal phytopathogen.

Abstract

Fish oil, rich in omega-3 polyunsaturated fatty acids (PUFAs), is widely recognised for its health benefits. However, its susceptibility to oxidation poses a significant challenge and leads to reduced nutritional quality and potential health risks. This study investigates the antioxidant activity of Melaleuca quinquenervia essential oil (MQEO) in fish oil and compares it with the synthetic antioxidant butylated hydroxytoluene (BHT). Experimental groups were formed by adding different concentrations of MQEO (100-800 ppm) to fish oil and oxidation levels were evaluated by peroxide value (PV) and malondialdehyde (MDA) measurements. The results showed that higher concentrations (≥400 ppm) of MQEO showed significant antioxidant activity by effectively reducing peroxide formation and lipid peroxidation compared to BHT. The major active components of MQEO, such as eucalyptol, viridifluorol and α-terpineol, contributed to its protective effect by inhibiting lipid oxidation. Given the growing concerns about the safety of synthetic antioxidants, MQEO offers a promising natural alternative to protect lipid-based products susceptible to oxidation. The findings suggest that MQEO may improve fish oil stability and extend shelf life while reducing potential health risks associated with synthetic preservatives.

Key Words: *Fish oil, Melaleuca quinquenervia, oxidation, antioxidant, lipid peroxidation*

Introduction

Fish oil, rich in omega-3 polyunsaturated fatty acids (PUFAs) such as eicosapentaenoic acid (EPA) and docosahexaenoic acid (DHA), is a widely recognized dietary supplement due to its anti-inflammatory, neuroprotective, and cardioprotective properties. EPA and DHA contribute to cardiovascular health by regulating lipid metabolism and improving endothelial function (Harris, 2004). DHA is crucial in neuronal membrane integrity and cognitive function (Das et al., 2009). Additionally, omega-3 fatty acids' anti-inflammatory effects suggest their potential in managing metabolic and autoimmune diseases.

As the human body cannot synthesize omega-3 fatty acids endogenously, dietary intake or supplementation is necessary. Fish oil, derived from species like anchovies, sardines, mackerel, and tuna, has gained global popularity, particularly among individuals prioritizing preventive healthcare (Pike & Jackson, 2010; Tocher, 2010). However, the rising demand for fish oil raises concerns regarding marine resource sustainability. Overfishing, habitat degradation, and climate change threaten fish stocks, with reports indicating severe depletion of global fish populations (Barange et al., 2018; FAO, 2022). Given these challenges, alternative omega-3 sources are essential to mitigate environmental risks while maintaining health benefits (Jackson, 2006).

Fish oil easily oxidizes because of its high content of unsaturated fatty acids (PUFAs) (Kazuo, 2019). PUFAs attract free radicals and oxygen by the typical mechanism of its multiple double bonds reacting, leading to the oxidative degradation of PUFAs. As they get oxidized, secondary oxidation products involving hydroperoxides, aldehydes, and ketones are produced, and such substances are catalyzed by fish meal. Besides, they may be potential health hazards to the consumer (Min & Boff, 2002). Both taste and odor disorders are caused by fish oil oxidation and decreased nutritional value. In addition, oxidized lipids cause cellular damage by oxidative stress and threaten human health (Shahidi & Zhong, 2010). For this reason, it is a must to add antioxidant compounds to fish oil products to avoid oxidation.

Nowadays, most fish oils take advantage of synthetic antioxidants in the production process. Butylated hydroxytoluene (BHT) and butylated hydroxyanisole (BHA) are frequently chosen as antioxidants for the food industry to prevent fat oxidation. However, new research has found that synthetic antioxidants may have potentially toxic effects and long-term health risks (Arneson & Roberts, 2007). The result is growing interest in natural sources of these compounds. Among these, the rule to contain oxidizes know-how to do so and are known as natural and, therefore, safe alternatives in food products (Ambrosio et al., 2021) are those derived from plants.

The study aimed to assess the antioxidant activity of Melaleuca quinquenervia essential oil in fish oil and to compare it with BH, a synthetic antioxidant. Experimental groups were formed by adding various proportions of Melaleuca quinquenervia essential oil to fish oil samples, and antioxidant activity was evaluated by intermittent measurement of the peroxide values. The study is predicted to bring significant outputs to the industry of natural antioxidants in the food sector.

Materials and Methods

Oxidation Experiments

The fish oil for which this research was obtained is from a Turkish company, a company that is professionally engaged in the production of fish oil for human consumption. Additionally, various concentrations of MQEO (100ppm, 200ppm, 400ppm, 800ppm) were dissolved in fish oil; having formed distinct experimental groups that were established to analyze its protective effect against the thermal oxidation of fish oil. Moreover, Butylated hydroxytoluene (BHT200) was used as a positive control at a concentration of 200 ppm. The treatments of the experimental afore-mentioned groups were implemented over a period of 96 hours, keeping them at a twofold climate of 55±0.5 °C that can be sustained by temperature-resistant containers and 70% humidity. Light was turned on to maintain the 7000 luxs level as cited in the paper (Kesbiç et al., 2023).

Peroxide Value

The peroxide value determination method (Cd 8b-90) established by the American Oil Chemists' Society (AOCS) was used to assess the protective efficacy of MQEO against oxidation under accelerated conditions. Unoxidized fish oil and 0.5 g samples from the oxidized experimental groups were dissolved in 5 mL of chloroform. The dissolved samples were then incubated with 15 mL of acetic acid and 1 mL of saturated potassium iodide for 10 minutes at ambient temperature and in the absence of light. Following incubation, titration was performed using 0.01 N sodium thiosulfate and a few drops of 1% starch in 75 mL of deionized water as the indicator. The peroxide value was calculated using a formula based on the color change that indicated the result of the titration.

$$PV\ (\%) = [(V1 - V0)\ N] / V$$

V1 and V0 denote the titrant volumes employed for the sample and blank, respectively; N represents the normality of the titration solution, and M indicates the sample weight. The peroxide value assay findings were assessed in triplicate as meq O_2 kg^{-1} oil.

Measurement of the MDA levels

The quantity of malondialdehyde (MDA) generated during lipid peroxidation has been determined using the method developed by Ohkawa et al. (1979), which relies on the reaction between thiobarbituric acid (TBA) and MDA. The intensity of the colorful reaction complex generated by MDA and TBA was quantified spectrophotometrically at a wavelength of 532 nm. Results are expressed as nmol MDA/mL (Ohkawa et al., 1979).

Volatile Components of Neroli Oil by GC-MS

Different MQEO volatile components based on GC-MS analysis were achieved using RTX-5MS capillary column. The process was carried out at 40°C oven temperature, and the injection volume was 1µL. This was compared to peaks in the W9N11 library. Thus, the volatile component profile of the oil was ascertained.

Statistical Analysis

Data are expressed as the mean ± standard deviation (SD). Statistical analyses were conducted using IBM SPSS Statistics version 20. A one-way ANOVA test was performed to assess the significance of differences among the sample groups, followed by group comparisons using Tukey's HSD (Honest Significant Difference) test. A significance threshold of $p < 0.05$ was applied in all analyses.

Results and Discussion

The peroxide values of the experimental groups after rapid oxidation showed significant variation ($P < 0.001$), indicating differing levels of oxidative stability among the treatments (Table 1). The oxidized fish oil group exhibited the highest peroxide value (75.18±0.99 meq O_2 kg^{-1}), confirming extensive lipid oxidation. In contrast, the fresh fish oil group had the lowest peroxide value (4.59±1.19 meq O_2 kg^{-1}), reflecting its unoxidized state. The synthetic antioxidant BHT (200 ppm) significantly reduced peroxide formation (26.48±0.75 meq O_2 kg^{-1}), showing a strong protective effect. Among the Melaleuca quinquenervia essential oil (MQEO) treatments, MQEO8 demonstrated the greatest antioxidant activity, resulting in the lowest peroxide value (21.12±0.87 meq O_2 kg^{-1}), followed by MQEO4 (24.24±0.72 meq O_2 kg^{-1}) and MQEO2 (24.62±0.65 meq O_2 kg^{-1}), which were statistically

similar to BHT. MQEO1 exhibited a slightly higher peroxide value (32.84±1.35 meq O_2 kg^{-1}), but still significantly lower than oxidized fish oil. These findings suggest that MQEO, particularly at higher concentrations, effectively mitigates oxidative degradation in fish oil, comparable to the synthetic antioxidant BHT.

Table 1. Peroxide amounts of experimental groups after rapid oxidation.

Experimental Groups	meq O_2 kg^{-1}	P value
Oxidized Fish Oil	75.18±0.99[a]	< 0.001
BHT 200	26.48±0.75[c]	
MQEO1	32.84±1.35[b]	
MQEO2	24.62±0.65[c]	
MQEO4	24.24±0.72[c]	
MQEO8	21.12±0.87[d]	
Fresh Fish Oil	4.59±1.19[e]	

Melaleuca quinquenervia essential oil (MQEO)

As a result of MDA analysis in the samples, it was determined that the levels in oxidised oil and MQEO4, MQEO8 and BHT 200 groups were significantly higher than fresh fish oil group ($P<0.05$). While the MDA level in MQEO1 group was significantly lower than the oxidised oil group ($P<0.05$), there was no significant difference between MQEO2 group and fresh fish oil group ($P>0.05$). The levels of the experimental groups are presented in Figure 1.

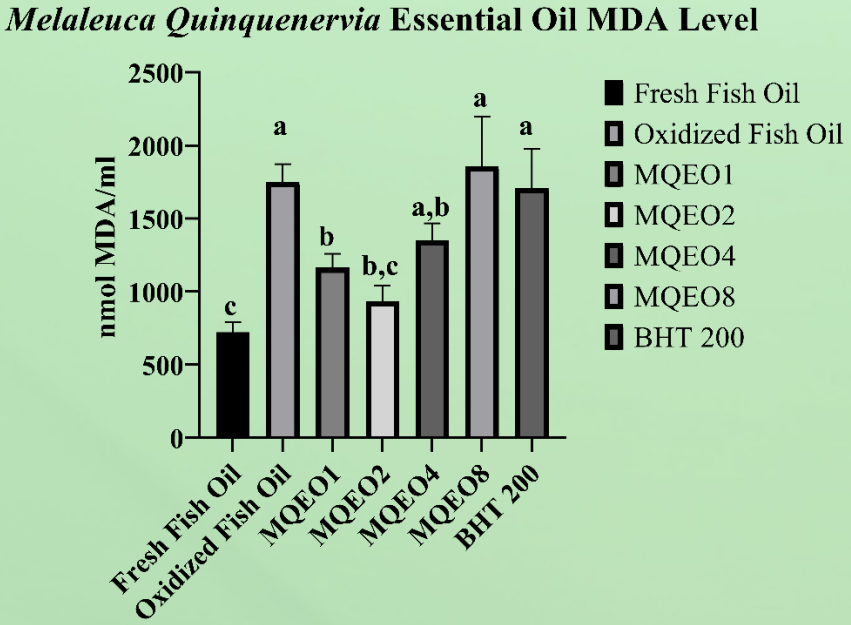

Figure 1. The MDA levels of the Experimental Groups.
Different letters indicate statistical differences between groups.

As a result of the analysis of the volatile components of *Melaleuca quinquenervia* essential oil, eucalyptol with a content of approximately 56%, viridifluorol and alpha terpineol with a ratio of 10% were determined. 1,8-Cineole (eucalyptol) is the main ingredient of *Melaleuca quinquenervia* essential oil and is, therefore, a monoterpene with beneficial antioxidant and antimicrobial properties. It has been evidenced that 1,8-Cineole, as an antioxidant, inhibits the peroxidation of lipids and is a source to neutralize the oxidative stress caused by the free radicals (Slamenova & Horvathova, 2013). Still, not only does it protect the cellular tubulin, but, also, 1,8-cineole acts in the DNA molecule thus attributing to the stability of the DNA and reduces the power of the inflammatory process (Mohammed et al., 2023). This element is also used in food preservation processes as a natural antioxidant which eliminates the necessity of the incorporation of synthetic antioxidants (Chrysargyris et al., 2020).
Virdifluorol, however, is a bioactive sesquiterpene with a mechanism to inhibit lipid oxidation by neutralizing free radicals. Studies have revealed that the essential oils containing viridiflorol represented remarkable DPPH radical scavenging activity and this compound presented a high antioxidant capacity which is known to be critical in shielding against oxidative stress (Mohammed et al., 2023). In addition, Viridifluorol has also been reported to stabilise biological systems by protecting cell membranes against oxidative stress (Macêdo et al., 2022). The use of essential oils containing viridifluorol is growing in the food industry, especially in fat-containing food products with long shelf life (Cutillas et al., 2017).

Another important component α-Terpineol is known for its strong antioxidant and anti-inflammatory properties. It has been shown that α-Terpineol reduces oxidative stress levels by reducing reactive oxygen species (ROS) and exhibits cell protective effects (Rodríguez et al., 2013). However, studies have shown that α-Terpineol inhibits lipid peroxidation and slows down oxidative deterioration in fat-based foods (Singh et al., 2009). Furthermore, α-Terpineol has been reported to reduce oxidative stress-induced inflammation by acting on anti-inflammatory mechanisms (Farhat & Jordán, 2009). Due to these properties, α-Terpineol is an important component that can be used as a natural antioxidant in the food industry.

Melaleuca quinquenervia essential oil exhibits a strong antioxidant activity thanks to the synergistic effect of these three components and provides a potential contribution to extend the shelf life of food products by preventing oxidative deterioration. As an alternative to synthetic antioxidants, the advantages of using these compounds obtained from natural sources, especially in oxidation-sensitive lipid-based foods such as fish oil, are becoming increasingly important.

In conclusion, the use of *Melaleuca quinquenervia* essential oil 200 ppm and above provided as effective protection as the commercially used synthetic antioxidant and the maximum application dose to suppress the oxidation process of fish oil accelerated by temperature, humidity and light.

Abstract

The economic success of farms with small ruminants depends to a large extent on increasing the number of offspring weaned per animal and reducing production costs. On small ruminant farms, all types of investments made throughout the year are not as effective as those made during the birthing period. Increasing the productivity level of the animals while reducing the associated losses of offspring are the key words for profitable and sustainable farming with small ruminants. It is well known that the most important factor affecting productivity in sheep and goat farming is the yield of offspring, and lamb and goat incomes depend on the level of fertility, the proportion of lambs and kids reared and the live weight of lambs and kids. Litter mortality varies depending on the production system and type of husbandry on the farm. These deaths usually occur in the first ten days after birth. Some precautions to be taken during these processes contribute significantly to the survival of the offspring. Worldwide, litter mortality in small ruminants varies between 4-21% depending on heredity and environmental factors. Most deaths in the offspring occur in the first week after birth. Some of these deaths are due to litter shedding, while others are due to postnatal bacterial or viral infections. A high number of lambs and kids at birth only makes sense if the losses of lambs and kids until weaning or marketing are low. For this reason, measuring reproductive performance as a function of growth results gains economic significance. In this context, this study aimed to investigate practices to reduce progeny mortality in small ruminant breeding.

Key Words: *Sheep, Goat, Lamb, Kids, Offspring Mortality*

Koyun ve Keçi Yetiştiriciliğinde Yavru Ölümlerinin Azaltılmasına Yönelik Uygulamalar

Özet

Küçükbaş hayvancılık işletmelerinin ekonomik başarısı, büyük ölçüde hayvan başına sütten kesimdeki yavru sayısının arttırılması ve üretim giderlerinin azaltılmasına bağlıdır. Küçükbaş hayvancılık işletmelerinde yıl boyunca yapılan her türlü yatırım, doğum dönemindeki yatırımlar kadar etkili değildir. Hayvanlarda verim düzeyini artırırken buna bağlı yavru kayıplarını azaltmak, karlı ve sürdürülebilir küçükbaş hayvancılık için anahtar kelimelerdir. Koyun ve keçi yetiştiriciliğinde verimliliği etkileyen en önemli etmenin yavru verimi olduğu bilinmektedir ve kuzu ve oğlak gelirleri döl verim düzeyi ile birlikte büyütülen kuzu ve oğlakların oranı ile kuzu ve oğlakların canlı ağırlıklarına bağlıdır. Yavru ölümleri, işletmelerde uygulanan üretim sistemi ve barındırma yönetimine bağlı olarak değişiklik göstermektedir. Bu ölümler, daha çok doğumu izleyen ilk on gün içinde gerçekleşmektedir. Bu süreçlerde alınacak bazı önlemler yavruların yaşama gücüne önemli katkı sağlamaktadır. Dünya genelinde küçükbaş hayvanlarda yavru ölümleri, kalıtsal ve çevresel faktörlere bağlı olarak %4-21 arasında değişmektedir. Yavru ölümlerinin çoğu doğumu izleyen ilk hafta içinde gerçekleşmektedir. Bu ölümlerin bir kısmı yavru atmadan, diğer önemli bir kısmı ise doğum sonrası bakteri ya da viral enfeksiyonlardan kaynaklanmaktadır. Doğumda kuzu ve oğlak sayısının yüksekliği ancak sütten kesim veya pazarlama dönemine kadar kuzu ve oğlak kayıplarının azlığı ile anlam kazanır. Bu nedenle büyütme sonuçlarına göre döl verim ölçütleri ekonomik olarak geçerlilik kazanır. Bu bağlamda bu çalışmada küçükbaş hayvan yetiştiriciliğinde yavru ölümlerinin azaltılmasına yönelik uygulamaların incelenmesi amaçlanmıştır.

Anahtar Kelimeler: *Koyun, Keçi, Kuzu, Oğlak, Yavru Ölümleri*

Giriş

Küçükbaş hayvanlar, özellikle yerli ırklar, sosyo-ekonomik açıdan tropik bölgelerdeki insan nüfusunun büyük bir bölümünün geçim kaynaklarında önemli bir rol oynamaktadır (Ahsani ve ark., 2010; Muhammedabadi, 2021; Masoudzadeh ve ark., 2020). Koyun ve keçi üretim işletmelerinin ekonomik ve biyolojik etkinliği genel olarak koyunların ve keçilerin verimliliğini ve üreme performansını artırarak iyileşmektedir (Zamani ve ark., 2015; Muhammedabadi, 2016; Amiri Roudbar ve ark., 2017, Amiri Roudbar ve ark., 2018; Ghotbaldini ve ark., 2019).

Genç kuzuların ve oğlakların ölüm oranları, özellikle geniş otlatma sistemlerine sahip bölgelerde oldukça yüksek olabilir. Küresel olarak, kuzular için sütten kesme öncesi ölüm oranı ortalama %15-20'dir (Flinn ve ark., 2020). Ancak Afrika, Hindistan ve Avustralya'nın tropikal meralarında bu oranlar keçiler için %30'u aşabilmektedir (Chen ve ark. 2024). Afrika'da kuzu ölümleri farklı koyun popülasyonları arasında %9 ila %76 arasında değişmektedir ve yaş, ırk ve üretim sisteminden etkilenmektedir. Kuzu ve oğlak ölümlerini azaltarak düşük girdili çiftçilik sistemlerinde küçükbaş hayvan üretim verimliliğini artırmaya acil bir ihtiyaç vardır (Mthi ve ark. 2020). Araştırmalar, genetik, çevresel ve yönetim faktörlerinin yüksek kuzu ve oğlak ölüm oranlarında etkili olduğunu göstermektedir. Bu faktörler arasında düşük doğum ağırlığı, cinsiyet, kuzulama veya oğlaklama sırasında yaş ve vücut ağırlığı, yetersiz kolostrum, yavrulama mevsimi ve yılı ile yavru verimi yer alır (Ibrahim ve ark. 2020; Flinn ve ark. 2020; Bangar ve ark. 2022; Ceyhan ve Kozaklı, 2023; Chen ve ark. 2024).

Anwar ve ark. (2024) yaptıkları çalışmada, kuzu ve oğlaklarda morbidite ve mortalite oranlarını azaltmak için anne bakımının iyileştirilmesi, kolostruma erişim, daha iyi bağ kurma ve çoklu doğumlar için uygun ortamların sağlanması gerekliliğini vurgulamaktadır. Habtegiorgis ve ark. (2022) koyun başına kuzular arasında ölüm oranını azaltarak pazarlama döneminde yavru büyüklüğünü ve ağırlığını artırmak, toplum temelli ıslah programının hedefi olduğunu belirtmiştir. Yaptıkları çalışmada, dişilerin hayatta kalma şansı erkeklere göre daha düşük ve üçüzler, dördüzler ve düşük doğum ağırlıklı (≤2 kg) doğan kuzular için hayatta kalma şansının düşük olduğunu bildirmiştir. Ek olarak üreme ve büyüme performansını iyileştirmeyi amaçlayan devam eden seleksiyon programı, kuzuların hayatta kalma oranı üzerinde olumlu bir etkiye sahip olduğu bildirilmiştir. Sürüdeki ortamın iyileştirilmesi, çoklu doğumlar için özel bakım ve küçük kuzular için bakım, kuzu sağkalımının daha da iyileştirilmesine yol açacağı bildirilmiştir.

Küçükbaş hayvan yetiştiriciliğinde yenidoğan ölümleri son yıllarda önemini korumakla beraber, önemli bir çiftlik geliri kaybını temsil etmekte, israfa katkıda bulunmakta ve hayvan refahını da olumsuz etkilemektedir (Dwyer ve ark., 2016). Biyolojik olarak, doğumdan sonra mümkün olan en kısa sürede iyi bir kolostrum alımının sağlanmasının yenidoğan sağkalımı için çok önemli olduğu açıktır. Bu, termoregülasyon, pasif immünolojik koruma için destek sağlar ve koyun ile kuzu arasındaki bağlantının geliştirilmesinde rol oynar. Kuzunun doğumdan sonra memeyi bulma ve hızlı bir şekilde emme davranışı, yeterli kolostrumun yutulmasını sağlamada önemli bir bileşendir. Deneysel çalışmalarda, kuzu ölümleri için ana risk faktörleri, özellikle gebelik sırasında yetersiz anne beslenmesi, doğum zorluğu, altlık materyali ve genetik nedeniyle düşük doğum ağırlığıdır ve bunların tümü kısmen kuzunun memeye ulaşma ve emme hızı üzerindeki etkilerine bağlanabilir. Benzer şekilde, ticari çiftliklerde, düşük doğum ağırlığı ve emme ile ilgili sorunlar, ölüm oranına önemli katkıda bulunan nedenler olarak tanımlanmıştır. Epidemiyolojik çalışmalarda, zor doğumlarda yardım sağlama gibi yönetim faktörlerinin, barınma ile ilişkili risk faktörlerinden daha önemli olduğu bildirilmiştir. Sosyal bilim çalışmaları, çiftçilerin genellikle yenidoğan ölümlerini iyileştirme konusunda olumlu bir tutuma sahip olduklarını, ancak bunun nasıl başarılabileceğine dair inançlarda farklılık gösterebileceğini, bazı çiftçilerin erken kuzu ölümleri üzerinde hiçbir kontrole sahip olmadıklarına inandıklarını göstermektedir. Çiftçilerin ve danışmanların yenidoğan sağkalım stratejileri geliştirmek için birlikte çalıştıkları kolaylaştırıcı yaklaşımların, kuzu ölümlerinde azalmaya yol açan koyun beslenmesini optimize etmek gibi yönetim hedeflerine ulaşmada etkili olduğu görülmektedir. Sonuç olarak, bilimsel araştırmaların, optimal doğum ağırlıkları, kuzu canlılığı ve yeterli kolostrum alımının önemini anlama gibi yenidoğan sağkalımını destekleyen biyoloji hakkında yararlı bilgiler sağladığı belirtilmiştir, ancak bu bilginin aktarılması, çiftlikte yönetim değişikliği psikolojisinin daha iyi anlaşılmasından fayda sağlayacaktır. Ek olarak, yeterli çiftlik kayıtlarına dayanarak, yenidoğan ölümleri ile ilgili şu anda önemli olan bilimsel literatürden yararlanan özel çözümler geliştirmek, yenidoğan ölümlerinin azaltılmasına yardımcı olacaktır (Dwyer ve ark., 2016). Kuzu ve oğlak ölümlerini azaltmak için önleme programlarının geliştirilmesi, ölüm modellerinin bireysel çiftlik bazında değerlendirilmesiyle başlar. Kuzunun rahim içinde mi yoksa rahim dışında mı öldüğünü ve süt alıp almadığını belirlemek, mevcut sorunları ve olası çözümleri tanımlamak için kritik öneme sahiptir. Önleme programları, en yüksek etki potansiyeline sahip alanlardaki kayıpları hedeflemek için önceliklendirilmelidir. Yüksek etki alanlarına örnek olarak anne beslenme programlarının optimize edilmesi, doğum ortamının iyileştirilmesi (ısı ve nem), melezleme programlarının kullanılması ve aşılar gibi hastalık önleme programlarının uygulanması öncelikli konulardır (Young ve ark., 2014).

Yavru ölümleri, işletmelerde uygulanan üretim sistemi ve barındırma yönetimine bağlı olarak değişiklik göstermektedir. Bu ölümler, daha çok doğumu izleyen ilk on gün içinde gerçekleşmektedir. Bu süreçlerde alınacak bazı önlemler yavruların yaşama gücüne önemli katkı sağlamaktadır. Dünya genelinde küçükbaş hayvanlarda yavru ölümleri, kalıtsal ve çevresel faktörlere bağlı olarak %4-21 arasında değişmektedir. Yavru ölümlerinin çoğu doğumu izleyen ilk hafta içinde gerçekleşmektedir. Bu ölümlerin bir kısmı yavru atmadan, diğer önemli bir kısmı ise doğum sonrası bakteri ya da viral enfeksiyonlardan kaynaklanmaktadır (Taşkın ve ark., 2005; Taşkın, 2014). Ülkemizde kuzu ve oğlak ölüm oranları yetiştirilen hayvanların genotip/ırk ve üretim sistemine bağlı olarak %9.5-14.43 arasında değişmektedir. Prenatal (doğum öncesi), neonatal (doğum sonrası ilk hafta) ve erken postnatal(yedinci gün ile sütten kesim arası dönem) ölümlerinin yüksek olmasının nedenleri arasında; doğuma bağlı anormallikler enfeksiyon ve hastalıkların yanı sıra düşük vücut ısısı, yeterli beslenememe ve düşük canlı ağırlık sayılmaktadır. Küçükbaş hayvancılık işletmelerinde karlılık ve sürdürülebilirlik, yeni doğan yavruların hayatta kalabilme gücü ile yakından ilişkilidir. Neonatal dönem, kuzu ve oğlaklarda hastalıkların ve ölümlerin meydana geldiği en kritik evrelerden biridir. Neonatal kayıplar genellikle düşük/yüksek doğum ağırlığı, distosi (zor doğum), düşük/yüksek kondisyon skorları, zayıf annelik davranışı, yetersiz kolostrum alımı, enfeksiyöz hastalıklar ve çevresel koşullar ile yakından ilişkilidir (Ünal ve ark., 2018; Tölü ve ark., 2007) Doğumlar sırasında olası yavru ölümlerini azaltılmasına yönelik öncelikli konular arasında işletmede uygun bir sürü yönetimi uygulanması ve hayvan refahının sağlanması yer almaktadır. Ülkemizde küçükbaş hayvan yetiştiriciliği yapan aile tipi işletmelerde genellikle ağıl temel birimleri tek bir çatı altında (bütünleşik ağıl yapı sistemi) düzenlenmiş olup, bu birimler yapı tekniği, hijyen, havalandırma yönünden yetersiz, diğer ağıl birimlerinin pek çoğu ise yok ya da yeterli değildir. Ayrıca bu tip ağıl yapılarında özellikle iklimsel faktörlerin olumsuz etkilerine karşı gerekli koruma sağlanamadığı için yavru ölümleri önemli bir sorun oluşturmaktadır (Ünal ve ark., 2018; Ceyhan ve ark., 2015).

Koyun ve Keçi Yetiştiriciliğinde Ölüm Oranlarını Etkileyen Faktörler

Kuzu - Oğlakların Barındırması ve Kolostrum (Ağız Sütü)

Yeni doğan yavrular için ilk 48 saat çok önemli olup bu süre altın saat olarak kabul edilir. Ağıllardaki doğum bölmeleri ve kolostrum uygulaması (ilk 6-12 saat içinde) yavru ölümlerinin önlenmesi bakımından oldukça önemlidir. Yeni doğan yavrularda açlık ve soğuk şokunda kaynaklanan ölümlerin önlenebilmesi için yavruların mutlaka doğumu izleyen ilk 6-12 saat içinde yeterli kolostrum almaları sağlanmalıdır (Goddard ve ark., 2006). Yeni doğan yavrularda açlık ve soğuk şoku, doğum sonrası yavru ölümlerinin önemli nedenleri arasında yer alır. Bu yavruları emiştirme/büyütme dönemi sonuna kadar sağlıklı ve canlı tutmayı başarmak, yavruların doğumu izleyen ilk 6-12 saat içinde yeterli ağız sütü (kolostrum) almaları ile olasıdır. Yavrular çevre koşullarına karşı korumasız ağıl ya da merada doğduklarında, ilk 18 saat içinde her 500 g vücut ağırlığı için yaklaşık 95 g kolostruma gereksinim duyarlar. Buna karşın kapalı ortamda 5-10 °C' de doğduklarında ilk 18 saat içinde her 500 g vücut ağırlığı için yaklaşık 80 g kolostruma gereksinim duyarlar (Gökçe ve ark., 2013; Ünal ve ark., 2018) Kuzu ve oğlakların barındırıldığı alanlarda özel olarak tasarlanmış besleme, ısıtma ve havalandırma sistemleri gerekmektedir. Yavruların barındırıldığı yapılarda, özellikle hijyenin sağlanması ve hastalıkların kontrol altına alınabilmesi için yeterli taze hava girişini sağlayacak etkin bir havalandırmaya gereksinim duyulmaktadır. Havanın temiz, nemden ari ve uygun bir hava akımının olması sağlanmalıdır. Bununla birlikte bölme içine rüzgârla hava girişi mutlaka önlenmelidir. Yavru bölmelerinin kuru ve drenajının çok iyi olması, hayvan hareketleri için yeterli büyüklükte ve yaralanmalara neden olmayacak şekilde tasarlanmasına dikkat edilmelidir (Ünal ve ark., 2018).

Ağıl Yapı Sistemi ve Üretim Sisitemleri

Barındırmada, çevre istekleri ve üretim sistemleriyle birlikte hayvan refahının dikkate alınması gerekmektedir. Koyun ve keçi barındırma biçimi, işletmenin amacının (sütçü, etçi, kombine ya da damızlıkçı) yanı sıra doğum mevsimi ve iklim gibi etmenlere bağlı olarak ülkeden ülkeye ve hatta bölgeden bölgeye değişiklik gösterebilmektedir.

Küçükbaş hayvan yetiştiriciliğinde üretim sistemleri, bölgelere ve hatta illere göre farklılık gösterebilmektedir. Bu nedenle, doğru üretim sisteminin seçimi, üremenin başarılı bir şekilde kontrol edilmesi ve yavru ölüm oranlarının sınırlandırılmasında karlılık ya da sürdürülebilirlik açısından oldukça önemlidir

Gebelik Döneminde Aşılama

Gebeliğin son döneminde yapılan aşılamalar, kolostral antikor düzeylerini artırarak neonatal kayıpları azaltır. Koyun ve keçilerde neonatal kayıpların önlenmesi rotoksemi, kuzu dizanterisi ve tetanoza bağlı kuzu ve oğlak kayıplarının önlenmesi için gebe koyunlarda klostridial aşılama programları önem arz eder.

Kuzu ve Oğlak Ölümlerinin Spesifik Nedenleri

Neonatal kuzu ve oğlaklarda, non-enfeksiyöz ve enfeksiyöz hastalıklar mortalitenin en önemli sebepleridir.

Çizelge 1. Küçükbaş hayvancılık işletmelerinde üretim sistemleri ve özellikleri (Taşkın ve ark., 2015)

Üretim sistemi	Üstünlükler	Sakıncalar
İlkbahar yavrulaması	• Yavru ölüm oranı düşük • Yem giderleri düşük • Barınma giderleri az • Kaba yem gereksinimini meradan karşılama	• İşgücü gereksinimi fazla • İç ve dış parazit mücadelesi fazla • Pazarlama ağırlığı düşük
Kış yavrulaması	• Parazitler daha az • Pazar potansiyeli yüksek • Yavru gelişimi daha iyi • İşgücü gereksinimi az	• Yavru ölüm oranı yüksek • Yem giderleri yüksek • Sağlık sorunları fazla • Barındırma giderleri yüksek
Yılda birden fazla yavrulama	• Yavru ölüm oranı düşük • Yıl boyu yavru pazarlayabilme • Hayvan başına fazla yavru satışı	• İşgücü gereksinimi fazla • Yem giderleri yüksek • Meme-ayak sorunları fazla • Doğum bölmesi gerektirir

Çizelge 2. Küçükbaş hayvancılık işletmelerinde ağıl sistemlerinin genel yapısal özellikleri (Ünal ve ark., 2006; Olgun, 2011)

Yapısal Özellik	Açıklama			
	İklimlendirmeye göre	Yapı tipine göre	Yapı şekline göre	Zemin düzenlemesine göre
Konstrüksiyon	• Soğuk ağıl (Doğal havalandırmalı) • Sıcak ağıl (Mekanik havalandırmalı ve ısıtmalı)	• Açık(sundurma) ağıl • Yarı açık ağıl • Kapalı ağıl • Tünel ağıl	• I tipi • U tipi • T tipi • L tipi	• Toprak zeminli • Beton zeminli • Izgara zeminli
Temel Birimler	• Damızlık koyun/keçi birimi • Bireysel/grup bölmeli doğum birimi • Yavru büyütme birimi • Sütten kesilmiş kuzu/oğlak birimi • Damızlık genç hayvan (erkek toklu/çepiç) yetiştirime birimi • Genç (dişi toklu/çepiç) ve damızlık erkek hayvan (teke/koç) birimi • Sağım yeri • Revir • Karantina bölmesi			
Diğer Birimler (Servis yapı ve tesisler)	• Hayvan yönetim tesisleri (Toplama ve sıkıştırma bölümleri, tartım ünitesi, ayak ve derin banyoluklar, kırkım yeri, yükleme rampası) • Yem ve gübre depolama yapıları (Silaj, kaba ve yoğun yem depoları, gübre çukuru) • Bakıcı konutu/idare binası • Hangar/garaj • Rüzgar kıranlar			

Non-enfeksiyöz Nedenler

Kuzu ve oğlaklarda non-enfeksiyöz hastalıklar genellikle sürü yönetimindeki hatalar ile ilişkili olup, doğumdan sonraki ilk bir hafta içinde ölümlerin en önemli sebebidir. Kuzu ve oğlak ölümlerinin en önemli nedenleri; güç doğum, erken doğum, hipotermi/hipoglisemi kompleksi (annenin yavruyu kabul etmemesi, yetersiz beslenme, açlık, soğuk hava, düşük doğum ağırlığı), vitamin iz element eksiklikleri, travma ve konjenital anomalilerdir.

Enfeksiyöz Hastalıklar

Neonatal dönem kuzu ve oğlak ölümlerinin %12'si enfeksiyöz hastalıklarla ilişkilidir. Neonatal dönem enfeksiyöz hastalıkların ortaya çıkmasında, kalabalık ağıllarda kuzuların anneleri ile bir arada bulundurulmaları, çok sayıda kuzunun bir arada bulundurulması, hastaların sağlıklılardan ayrılmaması, etkin tedavilerin yapılmaması, gebelik dönemi ve yeni doğanlarda aşı programlarının oluşturulmaması, kötü kolostrum yönetimi sonucu yeterli bağışıklığın gelişmemesi en önemli risk faktörleridir. Neonatal dönemde enfeksiyöz hastalıkların erken teşhisi, tedavinin hemen başlatılarak hastalığın yayılmasının önlenmesine yardımcı olur. Koyun ve keçiler, diğer çiftlik hayvanlarına göre tedaviye daha sınırlı cevap verir. Bu nedenle, enfeksiyöz hastalıkların tedavisinden ziyade önlenmesi önemlidir.

Sonuç ve Öneriler

Koyun/keçi işletmelerinde yavruların canlılığı, sağlığının korunması ve geliştirilmesi, doğum öncesi dönemin iyi yönetimi, sürü bazında doğru stratejilerin oluşturulması ve bireysel hayvan bazında doğru uygulamaları içeren

uygulamalar ile sağlanabilir. Koç seçimi, annelerin aşılanması, gebelik döneminde yavru sayısının belirlenmesi ve gebelik dönemindeki beslenme gibi faktörler yavruların canlılığı ve sağlığını önemli ölçüde etkilemektedir. Bireysel ya da grup düzeyinde doğum bölmelerinde hijyen, çevre koşullarının kontrolü, yavru hayvan sağlığı ile refahı bakımından önemlidir. Bu nedenle bölmelerde zeminin kuru ve drenajının çok iyi olmasına, hayvan hareketlerini kısıtlamayacak ve günlük işlerde zaman kaybını azaltacak şekilde tasarlanmış olmasına dikkat edilmelidir. Yeni doğan yavrularda açlık ve soğuk şokundan kaynaklanan ölümlerin önlenebilmesi için yavruların mutlaka doğumu izleyen ilk 6-12 saat içinde mutlaka yeterli kolostrum almaları sağlanmalıdır. Üretim sistemleri, bölgelere ve hatta illere göre farklılıklar gösterebilmektedir. Bu nedenle, doğru üretim sisteminin seçimi, üremenin başarılı bir şekilde kontrol edilmesi ve yavru ölüm oranlarının sınırlandırılmasında oldukça önemli faktörler olduğu unutulmamalıdır.

The crude oil percentage and fatty acid profile of turnip rape in continental climate conditions

Fatma Kayaçetin[1]

[1]Department of Field Crops, Faculty of Agriculture, Ankara University, Ankara, Türkiye

Abstract

Türkiye is an importer of vegetable oil and oilseeds. The necessity of mixing biodiesel produced from domestic agricultural products and/or waste vegetable oils into diesel fuel further increases our need for vegetable oils and oilseeds. Therefore, it is important to determine the potential of alternative plant sources that cannot be used in food in terms of supplying raw materials for biodiesel. *Brassica rapa* ssp. *oleifera* is a species with high commercial potential used as industrial seed oil. This study was done in the fall sowing of 2020 in Ankara according to a randomized block design and was established with 4 replications. It was aimed to detect the crude oil percentage and fatty acid profiles of the Tekirdag, Bursa and Tokat origin lines of this species. In terms of study findings, significant differences were found among the lines with regards to the examined traits. Crude oil percentage was detected as 26.93-36.60% in *B. rapa* ssp. *oleifera* lines. It can be stated that local turnip rapeseed lines are rich in unsaturated fatty acids and crude oil percentage, especially in monounsaturated fatty acids such as oleic (16.24-18.65%) and erucic acid (35.66-42.97%), which are the most important factors affecting biodiesel quality, and this species has an important potential as a biodiesel raw material. According to the results obtained from this study, it was detected that Bursa origin Br2 line with Tekirdag origin Br3 and Br6 lines had higher crude oil percentage than other lines. Therefore, it is recommended that these lines be further evaluated for sustainable biodiesel production.

Key Words: *Brassica rapa* ssp. *oleifera, Some quality traits, Oleic acid, Erucic acid*

Introduction

Türkiye is 60-70% dependent on foreign sources for the supply of vegetable oil raw materials. The only agricultural product group in the top 10 among Türkiye's import items is oilseeds and their derivatives. Between 2015 and 2023, 3.041.000-4.320.000 tons of oilseeds (sunflower, soybean, cotton, rapeseed and safflower) and 1.214.000-2.639.000 tons of crude oil were imported. In addition, 1.368.000-2.513.000 tons of oilseed meal are imported from abroad each year (Başalma et al., 2025). The requirement to blend at least 0.5% of biodiesel produced from domestic agricultural products and/or vegetable waste oils into diesel fuel further increases our existing need for vegetable oil and oilseeds (Official Gazette, 2017).

Brassica rapa ssp. *oleifera*, from the *Brassicaceae* family, is among the economically important oilseed crops (Aydin et al., 2024). This species grows as a weed under natural conditions in Türkiye (Kayaçetin et al., 2023). Field mustard (turnip rape), which originates from Asia and Europe, is a species that is more resistant to cold than rapeseed and has annual and biennial genotypes. Its winter genotypes are mostly grown in Europe, while its summer genotypes are grown in Canada, China and India (Aslan, 2023). Seed and seed oil are used as lubricants, in the production of insecticides, in pharmacy, medicine and cosmetics (Li et al., 2021). In addition, seed oil is suitable for biodiesel production and has a high potential for the production of efficient and high-quality biodiesel raw materials (Kayaçetin, 2023). This species, which can grow to 100-150 cm in length, has quadruple bright yellow flowers. According to studies conducted in Türkiye, this species is earlier than brown mustard, rapeseed and black mustard (Kayaçetin, 2019). Its seeds are almost round and are reddish gray to black (Kayaçetin, 2020). The quality characteristics of the oil, such as the ratio of seed oil and fatty acid components, are important factors determining the areas of use of the oil. Although the seeds of this species contain 25-35% fixed oil, they are not appropriate for direct use as human food because of the possible harm to human health owing to the high amount of erucic acid (30-40%) in the fixed fatty acid profile (Poddar et al., 2022), and are among the industrially important oils. The seed oils of this species, which cannot be used as food, can be used as potential low-cost sources for biodiesel production due to high erucic acid.

B. rapa ssp. *oleifera* fatty acid composition and fixed oil ratio may vary depending on genetic and environmental factors (Kayaçetin et al., 2018, Rai et al., 2018; Shyam et al., 2022). Therefore, determining the differences between genotypes allows the selection of genotypes according to the desired characteristics in breeding studies. The goal of this study was to detect the crude oil ratio and fatty acid profile of the seeds of 6 settled lines of the turnip rape lines.

Materials and Methods

In this study, 6 turnip rape settled lines were used as material. Seeds were obtained from the Field Crops Central Research Institute. All turnip rape lines used in this study are strictly winter.

Field trials were carried out in Ankara in the experimental area of the Central Field Crops Research Institute in the autumn growing season of 2019-2020 at 39°12′ – 43°6′ N, 35°58′ – 37°44′ E and 925 m above sea level, based on the randomized block design with four replications. The soils of the trial area are low in organic matter, clayey loam and slightly alkaline. When the climate data were evaluated; the average total precipitation for long years and the trial year was 391.9 mm and 269.6 mm. The max. and min. temperatures and relative humidity values for long years and the trial year were 10.5 °C, 40.4 °C, –17.9 °C, 63.9% and 10.5 °C, 35.5 °C, –12.2 °C, 58.3%, in the same order (Figure 1).

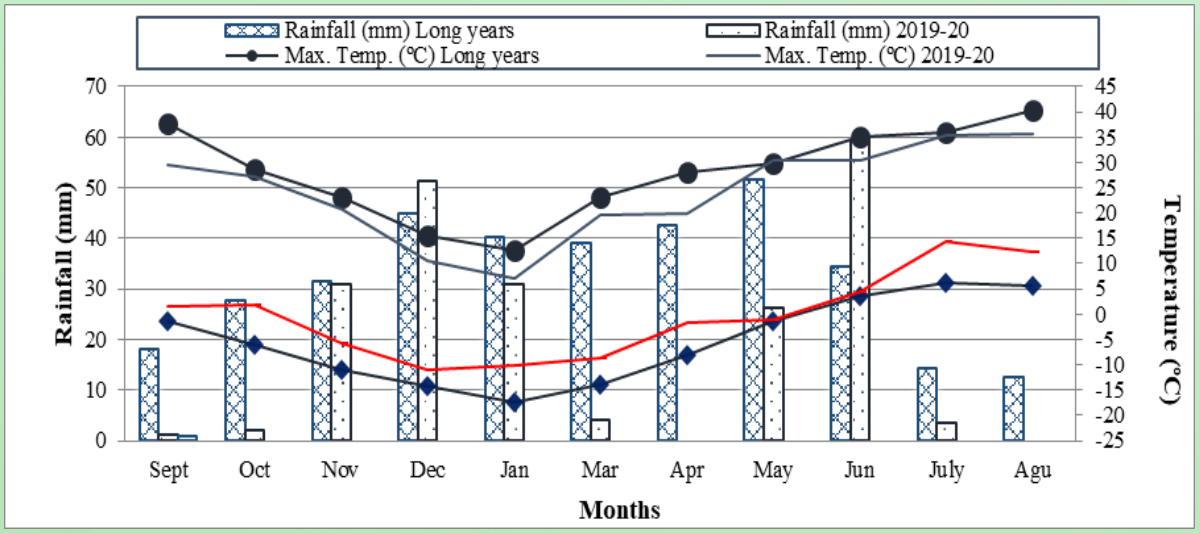

Figure 1. Monthly meteorological data of turnip rape of vegetation period (September to August)

The crude oil ratio and oil profile analyses of turnip rape lines were performed in 4 replications at the DB Agricultural Energy Biofuel Laboratory.

Crude oil percentage (%): The glass beakers to be used during the soxelet extraction process were dried in the drying oven until they reached a constant weight. The tare weight of the beakers was recorded. After the drying process was completed, approximately 5 g of the ground sample was weighed and placed in the soxelet cartridge. After the cartridge was placed in the soxelet extraction system, 140 mL of petroleum ether was added to the flask in the soxelet extraction system and the extraction process was performed. After the extraction process was completed, the extraction flask was kept in the drying oven at 80 °C for 1 hour. After the glass beaker removed from the drying oven was cooled in a desiccator, it was weighed and the amount of oil in the sample was calculated as a percentage (%) (Gölükçü et al., 2016).

Fatty acid profile (%): The fatty acid profile of lines oil in relation to TS 4664 and EN ISO 5508 was determined by gas chromatography-GC (Kayaçetin, 2023).

Data on seed crude oil percentage and fatty acid profiles of turnip rape lines were analyzed using Statistical Analysis Software JMP®13.2.1 using analysis of variance (ANOVA). Differences among means were separated using LSD tests ($p<0.05$).

Results and Discussion

The percentage of moisture in the seed, the percentage of crude oil in the moist seed and dried seed, palmitic, stearic, oleic, linoleic, linolenic, eicosenoic, erucic turnip rapeseed lines are presented in Table 3. Although the percentage of moisture in the seed and the ratio of stearic acid did not show statistically different according to the lines, other examined traits were found to be significant (Table 1). The maximum and minimum crude oil percentage in moist seed were detected 36.60% and 26.93%, in in he same order and in dried seed were determined 38,80% and 28,69% Br2 and Br1 lines, respectively. The maximum palmitic, oleic, linoleic, linolenic, eicosenoic, erucic (2.62, 18.65, 15.33, 11.57, 12.65 and 42.97%) were detected in Br5, Br6, Br5, Br3, and Br1lines, in the same order. The minimum values of 2.23, 16.24, 13.44, 10.10, 11.05, and 35.66 % were noted in Br1, Br1, Br1, Br1, Br3, and Br6 lines, respectively.

Table 1. The crude oil ratio and fatty acid component of turnip rape lines

	Moisture percentage in seed (%)	Crude oil percentage in moist seed (%)	Crude oil percentage in dried seed (%)	Palmitic (C 16:0)	Stearic (C 18:0)	Oleic (C 18:1)	Linoleic (C 18:2)	Linolenic (C 18:3)	Eicosenoic (C 20:1)	Erucic (C 22:1)

Sharafi et al. (2015) in their study evaluating 20 genotypes of different *Brassica* species including turnip rape, found that the crude oil percentage varied between 21% and 46%; palmitic, oleic, linolenic, linoleic, erucic and stearic acids constituted 89%-94% of the main fatty acids in this species. It has been reported that there are high genetic differences in crude oil percentage and fatty acid compositions among species and genotypes. Rai et al. (2018) in their study examining 5 different turnip genotypes, reported that the crude oil percentage of the genotypes varied between 40.35% and 41.43%. While the linoleic acid content varied between 14.08%-18.18% in turnip rape genotypes, the linolenic acid percentage changed between 9.82%-26.66%. Studies have shown that seed crude oil content and fatty acid composition of genotypes from different *Braasica* species are significantly affected by genotypic and environmental conditions (Da Silva Medeiros et al., 2022; Khan et al., 2022; Kayaçetin, 2023; Sachan et al., 2024).

According to Öğüt and Oğuz (2006), the supply of biodiesel raw materials from non-food oils should be a priority for sustainable biodiesel production. In order to meet both the food and energy demands of the increasing population, the use of fixed oils that cannot be used directly in food for energy purposes is important. It is thought that *B. rapa* ssp. *oleifera* lines, which are not appropriate for direct cooking oil use owing to the erucic acid content in seed fatty acids, can be used appropriately for industrial purposes in terms of fatty acids and can be evaluated as an alternative plant source for biodiesel due to their high adaptation to Türkiye conditions (Kayaçetin, 2023).

B. rapa ssp. *oleifera* lines used in this study exhibited an important level of diversity for the crude oil percentage and fatty acid profile. Although the fatty acid profile of oil turnip limits its use as direct human food, it may pose significant potential for different industrial areas. Based on the results obtained from this study, it was determined that the Bursa origin Br2 line with Tekirdag origin Br3 and Br6 lines had higher crude oil percentage compared to other lines. Therefore, particularly this lines were suggested for further evaluation for sustainable to obtain biofuel.

Evaluation of the Anti-inflammatory and Anti-hemolytic Potential of Polyphenolic Components of Common Mallow (*Malva sylvestris*)

Hamza Belkhodja, Abderrahmane Remil, Fatima Zohra Labbaci, Djilali Bouhadi, Asmaa Belmimoun, Khadidja Sidelarbi

[1]Department of Biology, Faculty of Nature and Life Sciences, University of Mustapha Stambouli, Mascara, Algeria.

Abstract

This work aims at the assessement of anti-inflammatory and anti-hemolytic effect of *Malva sylvestris*. The anti-inflammatory potential was evaluated by the inhibition of protein denaturation method. It was followed by the study of anti-hemolytic potential, based on two methods (haemolysis by hydrogen peroxide (H2O2) and by hypotonic haemolysis). The macerated aqueous extract of *M. sylvestris* (250 µg/ml) exhibited the highest inhibition percentage of BSA denaturation compared to other extracts but it appeared to be slightly lower than the drug diclofenac sodium (80.97±1.23%). On the other hand, the macerated aqueous extract showed more protective power against haemolysis (93.42±3.45%). While it was almost similar to the percentage recorded for ascorbic acid (93.68±3.21%). For the second method, it was observed that the decocted acetone extract of *M. sylvestris* showed a rate of haemolysis inhibition which was the highest (98.09±1.26%) but that it remained slightly lower than aspirin (98.77±0.44%). All of these results showed that *M. sylvestris* extracts have interesting anti-inflammatory and anti-haemolytic potential and therefore have considerable interest as an alternative treatment against inflammatory mechanisms.

Key Words: *Anti-hemolytic, Anti-inflammatory, Malva sylvestris, Polyphenols.*

Abstract

Ethiopia's agricultural sector is pivotal to its economy, employing approximately 85% of the population and contributing significantly to the national GDP. Despite its potential, the sector grapples with critical challenges such as food insecurity, climate change, land degradation, and limited market access. As a result, Ethiopia ranks 101st out of 125 countries on the 2023 Global Hunger Index, with 26.2% of its population undernourished. This review aims to explore the historical trends that have shaped Ethiopian agriculture, critically analyze contemporary challenges, and identify future opportunities for transformation. The findings highlight that policy shifts and technological advancements are essential for overcoming existing barriers. Key opportunities for enhancing agricultural productivity include the adoption of climate-smart practices, technological innovations, improved market access, sustainable land management, and necessary policy reforms. By addressing these challenges and leveraging opportunities, Ethiopia can achieve a more productive and sustainable agricultural system that supports food security and rural development. The commitment of all stakeholders is crucial for realizing these transformations in Ethiopian agriculture.

Optımızıng The Constructıve Parameters Of The Combıned Plough That Increases Productıvity In Graın Farmıng

Qurbanov Huseyn Nuraddin

"Agromechanika" Scientific Research Institute "Mechanization of crop production"laboratory, Aziz Aliyev 93, AZ2000, Ganja city, Azerbaijan, genclik79@mail.ru; ORCID: 0000-0002-3907-3384

Abstract

Currently, one of the leading areas of food security in the world is grain growing.Our goal is to develop grain growing on slopes.For the first time, the technological process of applying fertilizer in equal amounts to the soil on slopes and the constructive design of the working bodies, improved in the direction of obtaining quality grain in the cultivation of grain crops and increasing productivity, ensures the equal and quantity of sowing on sloping places by placing a "equal fertilizer spreader" working body at the outlet of the fertilizer pipe.The mineral fertilizer spreader is technologically and constructively new.The invention was patented by the Intellectual Property Agency of the Republic of Azerbaijan under document number F20240021.The efficient and optimal technological constructive parameters of the mineral fertilizer spreader have been substantiated.The optimal values were selected by building mathematical tables based on the parameters of the main parts of the newly created "equal fertilizer spreader".In a field test of the "equal fertilizer spreader" designed based on optimal values, the even distribution of urea fertilizer under the plow was 92%, double superphosphate was 94%, and potassium chloride was 93%.

Key words: equal fertilizer spreader,combined pluogh,constructive parametrs,mineral ferilizer,even distribution

Introductıon

Since the vast majority of Azerbaijani soils are carbonate, when phosphorus fertilizers are applied to such soils, phosphorus compounds combine with iron, aluminum, etc. in the soil, becoming insoluble compounds and poorly absorbed. In order to increase the efficiency of phosphorus fertilizers in these soils, it is of great importance to apply them under deep plowing as the main fertilizer. When the annual norm of phosphorus is high, it is advisable to apply part of it under plowing as the main fertilizer, and the rest together with sowing and as a feeding during the vegetation period, and to deeply bury it. It is useful to apply half of the annual norm of potassium fertilizer under plowing as the main fertilizer, and the rest as a feeding during the vegetation period. When calculating the usefulness of fertilizers, it is necessary to take into account not only their direct effect on the soil in the year of application, but also their effect in subsequent years, improvement of product quality, and increase in soil fertility (Abbasov İ.D.2011.,Alakbarov F.2016.).

Currently, various methods are used to apply fertilizers under plowing. At the same time, in our republic, mineral fertilizers are spread on the surface of the soil after harvesting with "Amazone ZA M" brand centrifugal disc fertilizer spreaders. Immediately after sowing, plowing is carried out with a plow so that the spread fertilizers fall under the soil. The operation is carried out in such a technological form.

The working width of the spreader always exceeds the design dimensions of machines with centrifugal working bodies, which is one of their main advantages. In this case, the uniformity of the spreader usually works with a previously unknown overlap of adjacent passages. The impossibility of strictly fixing the optimal working width is one of the main disadvantages of centrifugal working bodies of fertilizer spreaders. With changing operating conditions, the optimal working width determined experimentally for a particular type of fertilizer is limited to this. In addition, the actual working width of the machine does not always correspond to the optimal sowing, which leads to changes in speed and uneven application. It follows from this that the agro technical indicators of the centrifugal working bodies of the machines are interdependent and do not remain constant during operation due to the influence of many factors (Alakbarov J, al.et.2001)

In order to obtain high-quality grain and increase productivity in grain farming, the technology of applying equal amount of fertilizer to the soil and the justification of the design and technological parameters of the combined tillage were carried out, and laboratory and farm tests were carried out on a newly created experimental facility.

As you can see from the, two ATP-2 fertilizer spreaders are installed on the plough.The movement of the spreaders apparatus is provided by the support wheel of the plough.Fertilizer spreading rate is adjusted by changing wheels (Qurbanov H.N., 2023).

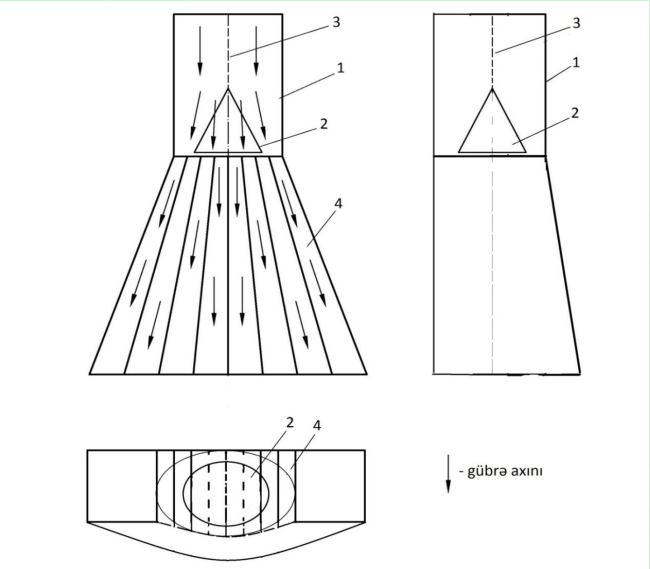

Fig.1 Equal spreader

1 - main cover, 2 - pendulum cone, 3 - chain, 4 - fertilizer channels

The field test of the combined plough is shown in figure 3.The combined plough consists of two ATP-2 fertilizer spreaders mounted on a SP-12 4-body plough manufactured in Turkey.Fertilizer devices get the movement from the support wheel of the plough through chain transmissions.Fertilizer spreaders, driven by the support wheel, deliver the fertilizer under the plow through four fertilizer tubes fig.2.

Figure 2 Laboratory test

A equal spreader is attached to the outlet of the pipes to ensure equal spreading of fertilizers.The use of the combined plough completely reduces the operation of spreading fertilizer with fertilizer spreaders before the plowing operation, the costs and labor spent on it, at the same time, high efficiency of the use of fertilizers is ensured, equal distribution the fertilizer under the soil prevents its loss, ensures its equal spreading, etc figure 1.In addition, time is significantly saved and operations can be performed in a short time (Qurbanov H.N., 2022).

Fig. 3 Field test

Material And Methods

The dimension parameters of the pendulum cone, which is the working body of the equal scatterer, are taken as the basis of the cone (tg γ) angle, cone height (h), cone diameter (d), distance between the cone and the wall (Z), and the charge distance from the cone to the partitions (h1) (OST. 70.71 – 2000);(Melnikov S.V. al.et.,1980).The main parameters of the subject on spreading width (D) were calculated and are given in Table-1. Based on mathematical calculations, the parameters of the working subject were selected spreading width (D). According to the conditions of the one-factor experiment, the distance between the cone and the wall (Z) and the charge distance from the cone to the partitions (h1) were taken with fixed numerical values by obtaining mathematical dependencies.

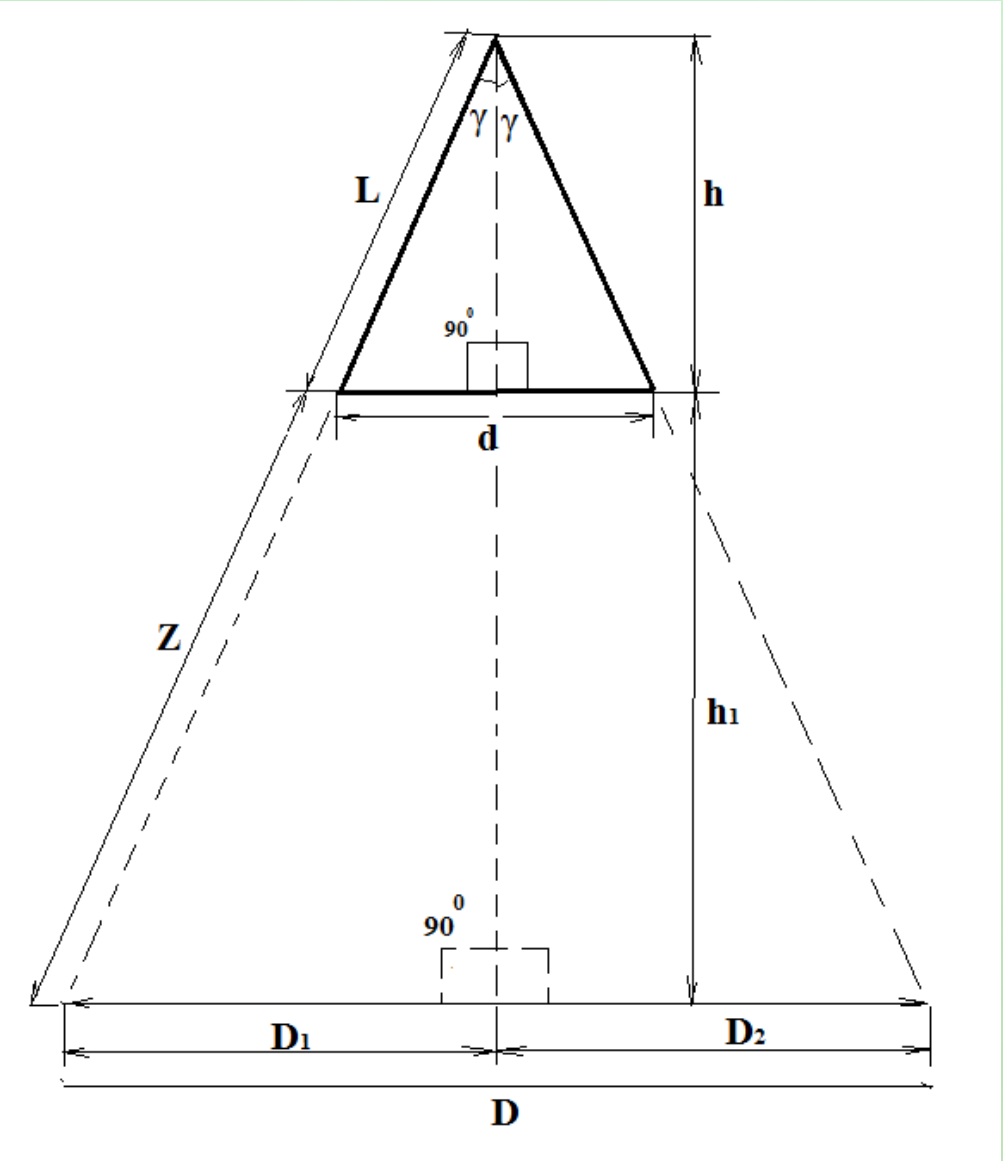

Figure 4 Dimensions and scattering parameters of the cone

Figure 4 is based on mathematical geometric calculation, based on the Pythagorean theorem of a right triangle, we can write the following formulas,

$L^2 = h^2 + (d/2)^2$; ..... (1)

$(L+Z)^2 = (h+h_1)^2 + D_1^2$; .....(2)

$D_1^2 = (L+Z)^2 - (h+h_1)^2$; .....(3)

$D_1 = \sqrt{(L+Z)^2 - (h+h_1)^2}$; ..... (4)

$D_2 = \sqrt{(L+Z)^2 - (h+h_1)^2}$; ..... (5)

$D = D_1 + D_2$; ..... (6)

$d = \sqrt{L^2 - h^2}$; ..... (7)

Fertilizer application rate (G), slope inclination (α°) were taken as the main factors influencing the uniform distribution of fertilizer to the combined plough.The sequence of experiments in the experiment planning matrix was determined using a table of random numbers.

In order to determine the rate of fertilizer spreading, the data of the Ministry of Agriculture for the Goy-gol region and the rate of spreading of laboratory research were selected: the upper limit for changing the movement speed of the aggregate was taken as 1.66 m/s.The researches were carried out in October, when the main rate was applied during the preparation of the soil for the planting of autumn cereals in 2020-2021.

In the flow pipe of the fertilizer spreader, a conical pendulum is placed in front of the flow to spread the inclined flow evenly.A section consisting of a partition divided into eight equal parts is prepared.Fertilizer is applied to the rear part of the 35 cm wide ladder by dividing the particles scattered from the conical pendulum into eight equal parts.

Results And Discussion

Mathematical models were constructed on the obtained parameters, calculating the percentage of equal dispersion in the direction of different angles in the laboratory conditions of a smooth disperser.

Reliability of distribution according to the technological scheme can be achieved under the condition that the selection of structural dimensions of the smooth spreading part allows optimal fertilizer distribution (Pyataev M.V.,2010).

Due to the fact that the working width of the cranberry in the plough trunk is 35 cm, the required spreading width D=35.2 cm, the angle of the cone tg γ =30 degrees, cone height h = 5.5 cm, and cone diameter d = 6.35 cm are taken from Table 1.The clearance distance between the cone and the wall Z =1 cm and the charge distance from the cone h_1 = 25 cm are taken as fixed values.

In order to verify the reliability of the control studies, to improve the proposed design of the machine and to justify its operating modes, field studies are determined, which ensures the spreading of fertilizers in the field.

Phosphorous and potassium fertilizers are not soluble in water, so the penetration area in the soil is small.However, since nitrogen-containing fertilizers are water-soluble, the penetration area in the soil is large.The spread of mineral fertilizers in the soil, the penetration of phosphorus substance from the place where it falls is 5.6 cm, and potassium substance is 6 cm (Klyatis L.M.,et.al., 1979);(Bagirov B. et.al.,2018).If we accept the penetration area of granular

particle as circular, then we can calculate the penetration area of phosphorus and potassium particle by mathematical method.

Penetration area of the phosphorus particle

$S_p = \pi r^2 = 3.14*2.8^{\ 2} = 24.62\ sm^2$

Penetration area of potassium particle

$S_k = \pi r^2 = 3.14*3^{\ 2} = 28.26\ sm^2$

Since the width of the plough cranberry is 35 cm, let's select the number of partitions that divide the distribution area in the size of the width of the cranberry.

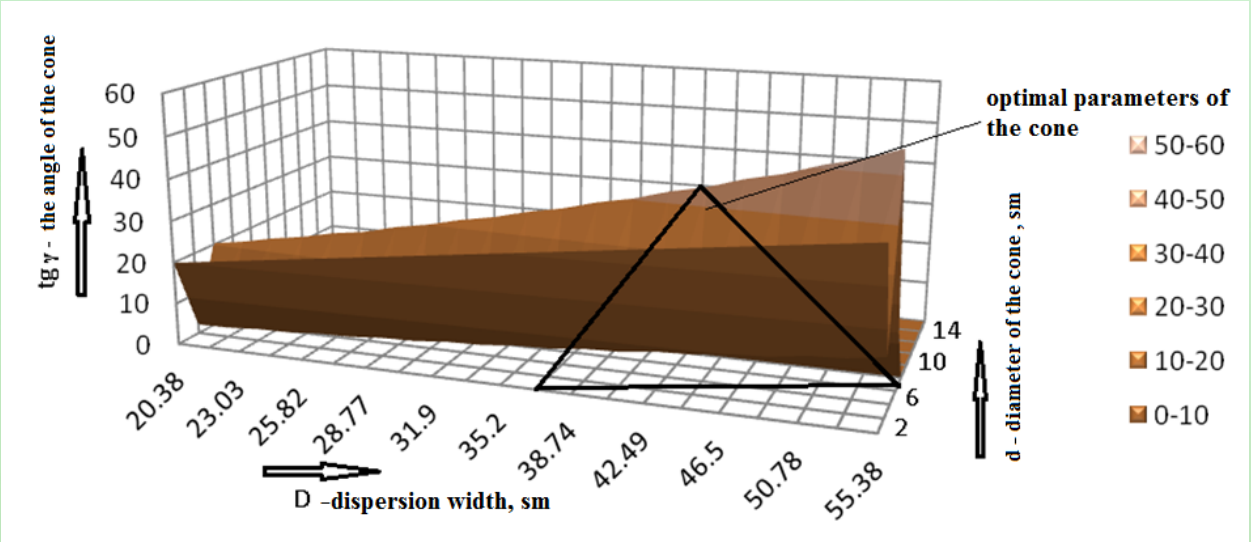

Fig. 5 Optimization graph of cone parameters

Table 2 Selection of the optimal value of the numerical content of partitions according to the penetration area of fertilizer particles

№	Partitions number, ps	number of channels, ps	The distance between partitions, sm	Channel width,sm	Area of a canal, sm^2	Penetration area of potassium particle, sm^2	Penetration area of the phosphorus particle, sm^2
1	4	5	8.75	5.5	48.13	28.26	24.62
2	5	6	7.0	5.5	38.5	28.26	24.62
3	6	7	5.83	5.5	32.1	28.26	24.62
4	**7**	**8**	**5.0**	**5.5**	**27.5**	**28.26**	**24.62**
5	8	9	4.38	5.5	24.09	28.26	24.62
6	9	10	3.89	5.5	21.4	28.26	24.62
7	10	11	3.50	5.5	19.25	28.26	24.62
8	11	12	3.18	5.5	17.5	28.26	24.62

Partitions, which are one of the structural main parts of the smooth spreader, create channels, and the optimal value of the number content of the penetration areas of fertilizer particles is selected from table 2.The number of partitions is 7, the number of channels is 8, the area of one channel is 27.5 cm^2.

In mountain agriculture, one of the main issues is to apply mineral fertilizers in equal amount to the soil before sowing the grain seeds. Mineral fertilizers containing phosphorus and potassium, distributed evenly under the soil, are easier to be absorbed by plants. From our research, it is clear that if the soil is cultivated at a depth of 18 cm, there is better distribution.

The nutritional area of each grain seed buried in the soil is provided with 90-97% nutrients. Even distribution significantly affects the development of the plant stem, its height, and the quality of the grain.

Analyzes showed that the fertilizer spreaders for the application of mineral fertilizers do not meet the agro technical requirements by unevenly distributing the fertilizers in the cultivated area, which leads to uneven development of plants and yield loss. Increasing the efficiency of the use of mineral fertilizers can be achieved by using technical means developed on the basis of scientifically based technological and technical solutions that ensure adaptation of the processes to the requirements of cultivated plants in terms of norms and types of mineral nutrition. The use of a combined plough completely reduces the operation of spreading fertilizer with fertilizer spreaders before the

plowing operation, the costs and labor spent on it, saving time and ensuring that the operations are performed in a short time. Distribute equally fertilizer under the soil is environmentally friendly and prevents fertilizer loss. Compared to centrifugal disc type machines, the most promising machines for application of solid mineral fertilizers are made with a combined plough, which ensures smooth spreading by reducing the unevenness of the horizontal, longitudinal and, accordingly, total spreading by 15-20%.The design of the combined plough has been developed, including: frame, bunker, sowing apparatus, equal spreader, motion transmissions, and plough.
We consider the combined plough to be a convenient technical tool for farmers.

Conclusions

1. The optimal size parameters and location of the pendulum cone, which is the working body of the equal fertilizer spreader, have been determined. The angle of the cone was tg γ=30°, the height was h=5.5 cm, the diameter was d=6.35 cm, the gap between the cone and the wall was Z=1, the distribution area from the cone to the partitions was h_1=25 cm, and the scattering width of the particles from the cone was D=35.2 cm.
2. The optimal number of partitioned fertilizer channels with an equal amount of fertilizer spreader and a working body has been determined. The number of partitions was 7, the number of fertilizer channels was 8, the distance between the partitions was 5 cm, the width of the channels was 5.5 cm, and the area of one channel was 27.5 cm^2.
3. As a result of selecting the optimal parameters, the "equal fertilizer spreader" evenly distributed granular fertilizers under the soil, and the urea fertilizer was 92.0%, double superphosphate - 94.0%, and potassium chloride - 93.0%.

Abstract

An on-station study was conducted at Adami Tulu Agricultural Research Center during 2021 to 2022/23 breeding season to evaluate the effect of sexed semen on fertility rate of cows, number of services per conception (NSPC), conception rate, sex ratio of calves born and the economics of using sexed semen in indigenous Arsi cattle. For evaluation purpose indigenous Arsi Breed cattle were selected from nucleus herd maintained at on station based on their parity, body condition and reproductive history and assigned to one of the following treatments. Animals in Treatment 1 were inseminated with conventional semen and Treatment 2 were inseminated with sexed semen. They were synchronized for estrus by injecting PGF2α hormone, whereas, those animals exhibited the sign of heat naturally were inseminated directly. Heat was detected by herdsmen in the early morning, mid-day, early evening and at nighttime. Standard procedure of semen handling and insemination was implemented during the study. Pregnancy diagnosis was performed by rectal palpation after 90 days of insemination. There was no significant difference (P>0.05) in NSPC between the treatments and the overall mean NSPC was 1.23±.049. There was no significant difference (P>0.05) in pregnancy rate between treatments. The pregnancy rate was 71% and 56.4% for conventional and sexed semen, respectively. The mean conception rate was 57.9% and 44% with conventional and sexed semen, respectively. There was a significant difference (P<0.05) in sex ratio of calves born between treatments. The average female calf obtained was 50% and 85% for conventional and sexed semen, respectively. The overall advantage of using sexed semen was 769,532 ETB and 15,390.64 ETB advantage per unit of sexed semen used. Sexed semen can be used as alternative artificial insemination technology for Arsi breed cows to produce more female calves for herd replacement. On-farm evaluation and demonstration of using sexed semen technology is important in potential areas suitable for dairy production.

Key words: *Sexed semen; conception rate; sex ratio*

Introduction

Naturally, it has been reported that the sex ratio among the mammals is 50:50 towards the birth of male and female offspring. However, depending on the demand of the livestock farmers, researchers have tried over the years to alter the ratio favoring the birth of a particular sex. Several such studies have considered different hypotheses viz. time of insemination, provision of different types of feeds and minerals, alteration of vaginal and uterine pH, use of sexed semen (De Graaf *et al.,* 2009), uses of certain chemicals. Observations of study by Khan *et al.,* (2012) indicated that alteration of sex ratio in cattle is financially attractive. In beef cattle production it can result in the birth of bull calves which have enhanced growth rate vis-a-vis those of the cow calves of the same age (Keane and Drenna, 1990). In contrary to the beef farms, dairy farmers are generally interested in female calves to maintain their herd. Furthermore, the requirement for a fewer male to female sex ratio (i.e., lower sex ratio) in dairy cattle is important when the herd replacement rates are high which can also help in improving the selection intensity (Badinga *et al,* 1985).

Most of the studies conducted on the sex ratio of calves produced by different insemination technologies have reported contradictory results. Birth of female calves is important especially among the dairy farmers or those who are associated with the dairy industry (Xu *et al.* 2000). Artificial insemination (AI) has been one of the widely accepted biotechnology that has revolutionized the optimum use of good quality sires. However small and medium scale dairy farms in different areas of Ethiopia have been complaining about more numbers of male calves being born following artificial insemination (AI) (Bekele, 2005, Frehiwet *et al.,* 2014) similar observations have also been reported by Skjervold and James, (1979) and Xu *et al.* (2000).
S. A. Holden and S. T. Butler, 2018 indicated that Sex-sorted semen is a revolutionary technology for cattle breeding. Utilization of sexed semen can increase the efficiency of both dairy and beef production, increase farm profitability and improve sustainability of cattle agriculture.

The use of sex-sorted semen in both dairy and beef production allows predetermination of calf sex with up to 90% reliability. More recent studies have demonstrated that sexed semen can be successfully used in both heifers and multiparous cows, (Butler *et al.,* 2014; Xu, 2014). Nevertheless, no research has been conducted on the effect of using sexed semen on the fertility of cows and sex ratio of calves in Arsi cattle breed. This study was conducted the following objectives:

Objectives

- To evaluate the effect of inseminating cows with sexed semen on the number of services per conception and conception rate and sex ratio of calves born
- To evaluate the economic benefit of using sexed semen for dairy producers

Materials and methods

Study area

The study was conducted at Adami Tulu Agricultural Research Center. The center is located at 167km south of Addis Ababa and situated at latitude of 7^0 9` N and $38^0$7`E longitude in semi-arid middle rift valley of Ethiopia. The area is situated at 1500 meters above sea level and the soil type of the area is fine, sandy loam and clay in the proportion of 34:48:18 respectively. The average annual rainfall is 760mm. The minimum and maximum temperature are 12.6 and 27^0c, respectively (ATARC, 2003).

Materials used

Experimental animals, sexed and conventional semen, liquid nitrogen, AI Gun, AI sheath, arm length glove and concentrate feeds. Sexed semen, Progeny tested frozen semen of Holstein Frisian sires of Worldwide Sires® (WWS), and Conventional frozen semen of Holstein Friesian sire reared at LDI were used.

Experimental animals

A total of 70 Arsi cows and heifers were selected based on several traits (parity, body condition, milk yield, mothering ability, free from reproductive diseases). Breeding was done from 2021/22 to 2022/23 breeding season.

Estrus synchronization: 2ml Lutylase hormone was injected to each cow after detecting the presence of responsive corpus luteum (CL) through rectal palpation. Animals exhibited signs of heat naturally were inseminated directly without the injection of hormone.

Heat detection: Cows were monitored by herdsmen and night guards for signs of heat (early in the morning, at daytime and late in the evening).

Breeding: Cows showing signs of estrus naturally or through administration of Synchromate hormone were inseminated with progeny tested sexed semen (obtained from Worldwide Sire ® (WWS) and conventional semen (obtained from LDI).
A standard semen handling and insemination procedure as recommended by IAEA (2005) was used to inseminate the animals. Cows noted in heat in the morning were inseminated in the afternoon and those identified in the afternoon were inseminated the next morning based on the “AM- PM guideline” (Peter and Ball, 1995).

Experimental design

The experimental animals were blocked based on their parity, age and body weight and assigned to one of the following treatments:
Treatment 1=Conventional Semen
Treatment 2= Sexed Semen

Collected data

Number of animals synchronized (treated with PGF2α), number of animals that come to heat, number of animals inseminated, number of services per conception, number of animals pregnant , number of calves born, sex ratio of calves at birth , General health data of the cows, cost of semen and other costs.

Pregnancy rate was calculated using the following formula:

$$\text{Pregnancy } Rate\ (\%) = \frac{Number\ of\ pregnant\ animals}{total\ number\ of animals\ inseminated} X100$$

Conception rate was calculated using the following formula:

$$Conception\ Rate\ (\%) = \frac{Number\ of\ pregnancies}{Number\ of\ inseminations} X100$$

Economics of sexed semen

Economics of using sexed semen was estimated by using simple and flawed model of the economics of sexed semen recommended by Fetrow J. (2007). The cost of both sexed and conventional semen per conception was considered as cost incurred. The sale price of 3-month male calves and yearling female heifers were estimated by dairy producers and individuals having experience in buying and sale of crossbreed animals in the area. Additionally the rearing cost of female calves until yearling age was estimated both by experienced dairy producers and technically by researchers. The profit of female claves is calculated as the difference between the selling price minus rearing cost of heifers (labor cost, price of milk consumed by heifers, veterinary costs, and costs of concentrate and roughage feeds. Finally, the overall advantage of sexed semen and advantage per unit of sexed semen was calculated as follows:

Advantage of sexed semen = Net income of sexed semen – Net income of conventional semen

$$\text{Advantage per unit of sexed semen used} = \frac{\text{Overall advantage of sexed semen}}{Total\ unit\ (dose)\ of\ sexed\ semen}$$

Data analysis

Collected data were entered into MS excel and data were analyzed using descriptive statistics and Chi square test. Significance was declared at P<0.05.

Results and Discussions

Number of services per conception

The result indicated that there is no significant difference in services per conception (NSPC) between the treatments and the overall mean NSPC was 1.23±.049 (Table 1). The current result is in line with reports by different authors who reported services per conception ranges from 1.06 to 2.6 (Million *et al.,* 2006; Genzebu *et al.,* 2016).

Table 1. Average number of services per conception of Indigenous Arsi cows inseminated with conventional and sexed semen

Treatment	N	Mean ± SE	P value.
Conventional semen	31	1.23±.076	
Sexed semen	39	1.28±.082	0.624
Total	70	1.26±.056	

Pregnancy rate

The result indicates that there is no significant difference in pregnancy rate between treatments (Table 2). The pregnancy rate is 71% and 56.4% for conventional and sexed semen, respectively. The current result is higher than the pregnancy rate reported by Seidel and Schenk (2002) who reported 43 to 62% and 31 to 42% pregnancy rate for conventional and sexed semen in different field experiments. The difference might be due to the environment in which the trial was conducted since our experiment was conducted at on station and the previous study was conducted on-farm.

The current result on pregnancy rate by using sexed semen is comparable to the results of Cerchiaro *et al.* (2007) who reported pregnancy rate of 51% for sexed semen in the field study conducted on Holstein Friesian cows in Italy.

Conception rate

The mean conception rate is 57.9% and 44% for conventional and sexed semen, respectively. The conception rate for sexed semen was lower than conventional semen. Norman *et al.* (2010) indicated that the process of sorting sperm cells reduces the conception rates in dairy cattle. The conception in current study was higher than the result reported by Norman *et al.* (2010) who reported the conception rates of 30 and 25% by using conventional and sexed semen.

Table 2. Pregnancy rate of Indigenous Arsi Cows inseminated with conventional and sexed semen

Treatment	Parameter	Pregnancy rate		Total	P value
		Positive	Negative		
Conventional semen	N	22	9	31	
	%	71	29	100	
Sexed semen	N	22	17	39	0.0158
	%	56.4	43.6	100	
Total	N	44	26	70	
	%	62.9	37.1	100	

The result of conception rate observed in the current study was lined with the report of Anonyms (2020) who reported the conception rate of (50.2% vs. 60.3%, for sexed and conventional semen, respectively. In contrast to this Oikawa K, *et al.* (2019) and Sahereh Joezy-Sh. e*t al.* (2017) reported 47.3% and 48.3% conception rate by using sexed semen and 63.8% using conventional semen in Holstein cows. The difference might be due to the number of data taken and easily accessibility of fresh processed semen we use imported sexed semen.

Sex ratio of calves born

The result indicated that there is a significant difference (P <0.05) in sex ratio of calves born between treatments (Table 3). The rate of obtaining female calf was 85% and 50% for sexed semen and conventional semen, respectively. Albert De Vries (2010) indicated that sexed semen with relatively more X- chromosome bearing sperm had a greater chance to result in female calf. It is justifiable that sexed-sorted semen produces a greater number of single sexes as the desire of the producers, and we used X-chromosome sorted semen.

The current result on calve sex ratio was in line with previous reports on sexed semen between 85 and 91% by Tubman *et al.* (2004); Borchersen & Peacock (2009); DeJarnette *et al.* (2009); Norman *et al.* (2010). Norman *et al.* (2010) and Alemayehu and Girma (2019) reported 48% and 42.9% female calf ratio by using conventional semen, respectively.

Table 3. Sex ratio of calves born from Indigenous Arsi Cows inseminated with conventional and sexed semen

Treatment	Parameter	Sex of calves born		Total	P value
		Female	Male		
Conventional semen	N	11	11	22	
	%	50	50	100	
Sexed semen	N	17	3	20	0.018
	%	85	15	100	
Total	N	28	14	42	
	%	66.7	33.3	100	

Economics of sexed semen

The overall advantage of sexed semen and advantage per unit of sexed semen used were calculated and the result revealed that the use of sexed semen is economical. The overall advantage of using sexed semen was 769,532 ETB and 15,390.64 ETB advantage per unit of sexed semen used. The current result is contrast with the findings of De Vries (2008) who reported that the use of sexed semen across all heifers is not necessarily profitable. The difference might be due to the difference in conception rate as they reported lower conception rate of sexed seme than the current finding.

Conclusions and Recommendations

The number of services per conception was similar across the types of semen used for insemination. Conception rates have a positive correlation with the number of pregnancies show similar trends with pregnancy rate across treatments.

Use of sexed semen is economical and has an advantage over conventional semen.
Maximum care must be taken by Artificial inseminators and farm owners on using sexed semen to attain best conception rate.
Sexed semen can be used as technological intervention for dairy farms who needs more female calves for herd replacement. Use of sexed semen needs to be evaluated and demonstrated at on farm level in potential areas suitable for dairy production.

Table 4. Economics of conventional and sexed semen used in Indigenous Arsi cows

Parameter	Unit	Conventional semen	Sexed semen
Conception rate	%	71	44
Amount of semen used	Number	38	50
Semen price	ETB	14	3,000
Total cost of semen	ETB	532	150,000
% of heifers	%	50	85
Number of heifers	Number.	11	28
% of bulls	%	50	15
No of male calves	Number.	11	14
Price of heifer	ETB	80,000	80,000
Cost to rear a heifer	ETB	27,000	27,000
Profit per heifer	ETB	53,000	53,000
Sale price of a bull calf	ETB	6,000	6,000
Income from heifers	ETB	583,000	1,484,000
Income from bulls	ETB	66,000	84,000
Total income	ETB	649,000	1,568,000
Total income minus semen cost	ETB	648,468	1,418,000
Advantages of sexed semen	ETB	769,532.0	
Advantage per unit of sexed semen used	ETB	15,390.64

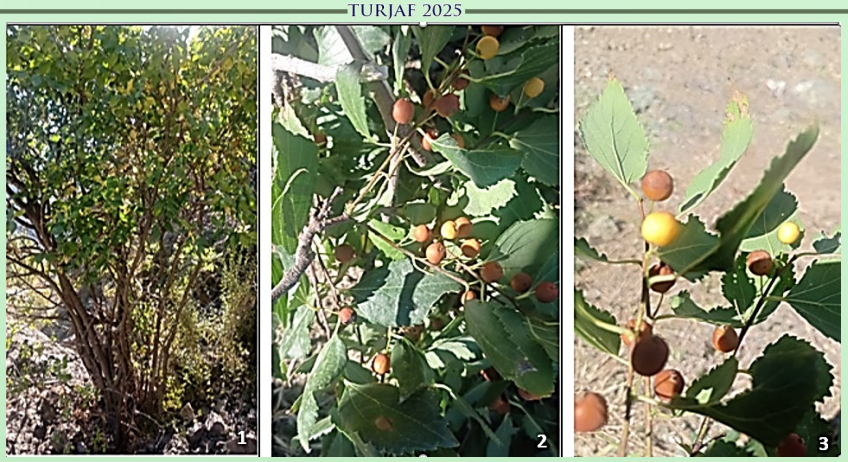
Abstract

Celtis species are known to be used in traditional medicine for treating diseases such as edema, hypertension, kidney disorders, diabetes, cancer, and joint pain. In this study, the antiradical (DPPH), reducing power (CUPRAC and FRAP) activities, and total phenolic and flavonoid content of methanol extracts from *Celtis tournefortii* fruits (CTM) and leaves (CTY) were evaluated. The total phenolic content in *C. tournefortii* fruit and leaf extracts was determined to be 2.0±0.10 mg GAE/g and 18.63±1.52 mg GAE/g, respectively. The flavonoid content was calculated to be 11.71±0.14 mg KE/g in CTM and 21.93±1.53 mg KE/g in CTY. It was observed that the radical scavenging activity was higher in *C. tournefortii* leaf extracts. Additionally, the reducing power of Fe^{3+} and Cu^{2+} was also relatively higher in the *C. tournefortii* leaf extract. The current study demonstrated that *C. tournefortii* fruits and leaves contain bioactive compounds and possess antioxidant activity. Although the antioxidant activities of the extracts were found to be low, the presence of radical scavenging and reducing power was detected. The findings emphasize the potential of the plant *C. tournefortii*, commonly known as dardağan, as a functional food component and a natural antioxidant source.

Keywords: *Celtis tournefortii, Antioxidant, Dardağan, Çitlembik, Phenolic compounds.*

C. tournefortii Meyve ve Yapraklarının Antioksidan Aktivitesi

Özet



Celtis türlerinin halk arasında ödem, hipertansiyon, böbrek rahatsızlıkları, diyabet, kanser ve eklem ağrıları gibi hastalıkların tedavisinde kullanıldığı bilinmektedir. Bu çalışmada *Celtis tournefortii* meyve (CTM) ve yapraklarının (CTY) metanol ekstraklarının antiradikal (DPPH), indirgeme gücü (CUPRAC ve FRAP) aktiviteleri, toplam fenolik ve flavonoid madde miktarları değerlendirilmiştir. *C. tournefortii* meyve ve yaprak ekstraklarında toplam fenolik madde miktarı sırasıyla 2.0±0.10 mg GAE/g ve 18.63±1.52 mg GAE/g olarak belirlendi. Flavonoid madde miktarı CTM'de 11.71±0.14 mg KE/g iken CTY'de 21.93±1.53 mg KE/g olarak hesaplandı. *C. tournefortii* yaprak ekstraklarda radikal giderme aktivitesinin daha yüksek olduğu görüldü. Ayrıca Fe^{3+} ve Cu^{2+} indirgeme gücünün *de C. tournefortii* yaprak ekstraktında nispeten daha yüksek olduğu görüldü. Mevcut çalışmada *C. tournefortii* meyve ve yapraklarının biyoaktif bileşen içerdiğini ve antioksidan aktiviteye sahip olduğunu gösterdi. Ekstrakların antioksidan aktiviteleri düşük bulunmasına rağmen radikal giderme ve indirgeme gücünün var olduğu tespit edildi. Elde edilen bulgular dardağan olarak isimlendirilen *C. tournefortii* bitkisinin fonksiyonel gıda bileşeni ve doğal antioksidan kaynağı olarak potansiyelini vurgulamaktadır.

Anahtar kelimeler: *Celtis tournefortii, Antioksidan, Dardağan, Çitlembik, Fenolik bileşen*

Giriş

Bitkiler birincil metabolizmalarını yaşamsal aktiviteleri için kullanılırken, ikincil metabolizmanın sonucu üretilen metabolitleri de stres durumlarında kullanırlar. Bitkiler tarafından üretilen ikincil metabolitler canlılarda birçok biyolojik aktivitede yüksek fayda sağlayan bileşiklerdir (Baran ve Keskin 2023). Bitkiler tarafından kimyasal savunma mekanizması olarak üretilen biyoaktif bileşikler antioksidan, antimikrobiyal ve antitümör etkiler gösterirler (Keser ve ark., 2017.

Ilıman ve tropikal iklimlerde yetişen dağdağan (*Celtis tournefortii* Lam.), Türkiye'de çeşitli kullanım alanlarına sahip bir meyve türüdür. Kendirgiller (*Cannabaceae*) familyasına ait olan *Celtis*, her yıl yapraklarını döken ve orta boy ağaçlardan oluşan bir bitkidir (şekil 1). Bu bitki, yöresel olarak dağan, dağdağan, dardahan, çitemik, çitlembik, davin, gıngırez, ılıç, melengiğ, yabani kiraz veya çıtlık gibi adlarla bilinmektedir (Yaltırk 1998; Yücedağ ve Gültekin 2008, Demirdağ 2023).

Şekil 1. *Celtis tournefortii* (Dardağan) Bitkisi (1: *Celtis tournefortii*'nin ağaç formu, 2,3: *Celtis tournefortii*'nin yaprak ve meyveleri)

Celtis tournefortii Türkiye'de kendiliğinden yetişen dört çitlembik türünden birisidir. Doğu çitlembiği olarak da bilinen *dardağan*, yaprak döken ve boyu 2 ila 3 m'ye kadar büyüyebilen bir ağaç türüdür. İlkbahar aylarında çiçek açar ve çalılıklar, kayalık yamaçlar ve ormanlarda kendiliğinden büyür. Eylülden ekime kadar meyve veren bu ağacın meyveleri küçük nohut büyüklüğünde, çekirdekli ve fıstık tadındadır. Başlangıçta açık kahverengi olan meyveler olgunlaştıkça koyu kırmızımsı veya sarımtırak kırmızı renk alır (Özrenk ve ark., 2012; Keser ve ark., 2017; İkinci, 2018). Dardağan meyveleri başta Türkiye olmak üzere Yunanistan, Irak, Azerbaycan, Ukrayna gibi ülkelerde yaygın olarak tüketilir.
Farklı *Celtis* türleri ödem, hipertansiyon, böbrek rahatsızlıkları, diyabet, kanser ve eklem ağrıları gibi hastalıkların tedavisinde kullanılmaktadır (Gecibesler, 2019). Ayrıca *C. tournefortii* tohumları böbrek kumuna karşı, yaprakları mide ağrısında, kanamayı durdurmada, yatıştırıcı amaçlarda ve sindirimi kolaylaştırmakta kullanılmıştır (Keser ve ark., 2017). Bazı *Celtis* türlerinde yapılan çalışmalar flavonoid, kumarin, fenolik, tanen ve alkaloid gibi bileşiklerin bu türlerde bulunduğunu bildirmiştir (Kim ve ark., 2005; Badoni ve ark., 2010).
Bu çalışmada *Celtis tournefortii* bitkisinin meyve ve yapraklarından elde edilen ekstraklarda toplam fenolik ve flavonoid madde miktarlarının belirlenmesi ve farklı yöntemler kullanarak antioksidan kapasitesinin incelenmesi amaçlanmıştır.

Materyal ve Metod

Bitki numunelerinin toplanması ve ekstrakt eldesi

Çalışmamızda kullandığımız *Celtis tournefortii* örnekleri Erzurum/Olur bölgesinden toplanmıştır. Toplanan bitki örnekleri fiziksel kirlerden arındırılmak amacıyla önce musluk suyu ile ardından destile su ile yıkandı. Numunelerin meyve ve yaprak kısımları ayrılarak gölgede kurutuldu. Kurutma işlemine numuneler sabit ağırlığa ulaşıncaya kadar devam edildi. Kurutulmuş numuneler öğütücü kullanılarak toz haline getirildi. Buradan alınan numune örnekleri üzerine 200 ml metanol ileve edilerek manyetik karıştırıcıda karıştırıldı. Elde edilen karışım süzüldü. Bu işlem 50 ml metanol ilave edilerek 3 kez tekrarlandı. Elde edilen karışımdaki metanol evaporatör yardımıyla uzaklaştırıldı. Elde edilen ekstraklardan 1000 µg/mL konsantrasyonda stok çözeltiler hazırlandı.

Toplam Fenolik ve Flavonoid Madde Tayini

Ekstrakların toplam fenolik madde tayini Folin-Ciocaltaeu metodu kullanılarak yapıldı (Slinkard ve Singleton 1977). Bunun için bir tüpe 1000 µg/mL stok çözeltiden 100 µL alınarak üzerine 100 µL Folin- Ciocaltaeu reaktifi ve 4.5 mL destile su ilave edildi. 3 dk bekletildikten sonra %2'lik Na_2CO_3 çözeltisinden 300 µL eklendi. Oda sıcaklığında 2 saat inkübe edilen karışım 760 nm'de absorbansı ölçüldü ve toplam fenolik madde miktarı standart grafik yardımıyla gallik aside eşdeğer olarak belirlendi (mg GAE/g). *C. tournefortii* meyve ve yaprak ekstraklarının toplam flavonoid madde miktarı alüminyum nitrat metodu kullanılarak belirlendi (Moreno et al. 2000). Stok çözeltiden 500 µL alınıp üzerine 1 M CH_3COOK çözeltisinden 100 µL ilave edilip 1 dk bekledikten sonra üzerine 100 µL %10'luk alüminyum nitrat eklendi. Toplam hacim 5 mL olacak şeklide etil alkol ilave edilip oda sıcaklığında 40 dk inkübe edildi. İnkübasyon süresi sonunda 415 nm'de absorbans değerleri belirlendi. Ekstraklarının toplam flavonoid madde miktarları standart kuersetin grafiği yardımıyla mg KE/g ekstrakt olarak hesaplandı.

DPPH• Serbest Radikal Giderme Aktivitesi Tayini

Ekstraların radikal giderme aktiviteleri Blois (1958) metodu kullanılarak belirlendi. Serbest radikal olarak 1,1-Difenil-2-pikrilhidrazil ve standart olarak 2,6-di-t-bütil-1-hidroksitoluen (BHT) kullanıldı. Ekstraktlardan 25, 50,

100, 150 ve 200 µg/mL konsantrasyonlarında hazırlanan çözeltilerden 500 µL ve DPPH çözeltisinden (0,1 mM) ise 2500 µL alınıp tüp içerisinde karıştırldı. Daha sonra oda sıcaklığında ve karanlıkta 30 dk inkübe edildikten sonra 517 nm'de absorbansları metanole karşı ölçüldü.

DPPH• radikali giderme aktivitesi (%) aşağıda verilen formül ile hesaplandı:

% İnhibisyon = $[(A_K - A_N) / A_K] \times 100$

A_K: Kontrol reaksiyonunun absorbansı, A_N: Örneğin absorbansı

Cu^{2+}-Cu^{+} Azaltma Kapasitesi (CUPRAC) Tayini

Ekstrakların Cu^{2+} indirgeme kapasitesini belirlemek için Apak ve ark., (2004) geliştirmiş oldukları metod kullanıldı. Öncelikle tüp içerisine 1'er mL $CuCl_2.2H_2O$ (10 mM), neokuprin (7,5 mM) ve NH_4CH_3COO (1 M) çözeltilerinden alındı. Üzerine 0.5 mL farklı konsantrasyonlarda hazırlanmış ekstrak çözeltisinden ve 0.5 mL saf su ilave edildi. Karışım 30 dk oda sıcaklığında bekletildikten sonra 450 nm'de absorbansları ölçüldü Standart olarak kullanılan BHT ve Troloks kullanıldı.

Fe^{3+}-Fe^{2+} İndirgeme Gücü Testi

Oyaizu (1986) metodu kullanılarak ekstraktın Fe^{3+} indirgeme gücü belirlendi. Bunun için farklı konsantrasyonlarda hazırlanmış ekstrak çözeltilerinden 0.5 ml alınıp üzerine 2.5 mL 0.2 M'lık fosfat tamponu (pH:6.6) ve 2.5 mL %1'lik $K_3Fe(CN)_6$ eklendi. Karışım 50 ºC'de 20 dk inkübe edildikten sonra %10'luk triklorasetik asit (TCA) ilave edilerek karıştırıldı. 2000 rpm'de 10 dk santrifüj sonunda tüplerden 2.5 mL başka bir tüpe alındı. Üzerine 2.5 mL saf su ve 0.5 mL $FeCl_3$ ilave edilerek 700 nm'de absorbans değeri belirlendi. Standart olarak BHT ve Troloks kullanıldı.

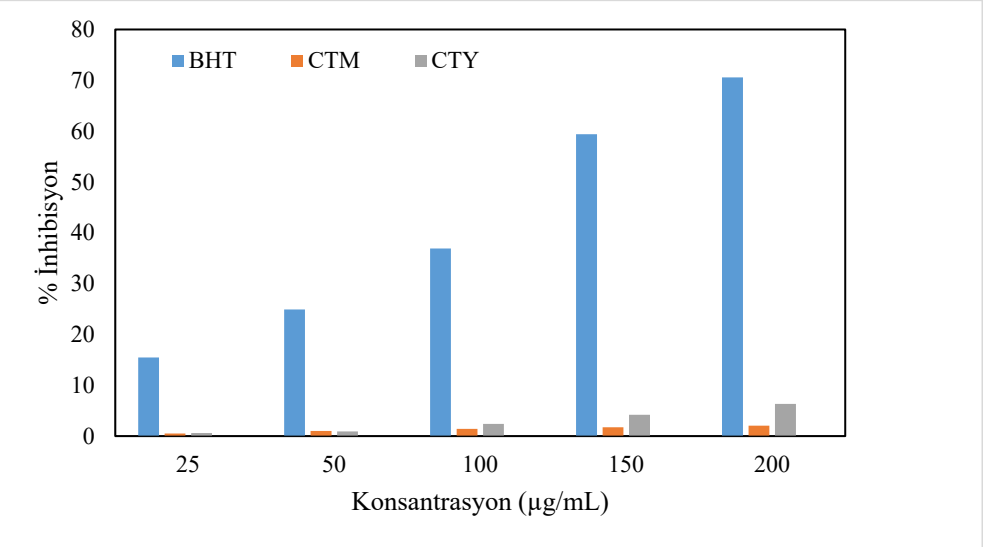
İstatiksel Analiz

Çalışmanın istatistiksel değerlendirilmesinde SPSS 22 V® istatistik paket programı kullanılmıştır. Başlangıçta tek yönlü kullanılmış, farklılıkların önemli olarak belirlendiği durumlarda ise çoklu karşılaştırma testlerden olan Duncan testi kullanılmıştır (Duggan ve ark., 2017). Çalışmada önemlilik düzeyi $P<0,05$ seviyesinde belirlenmiştir.

Bulgular ve Tartışma

Yüzyıllar boyunca varlığını sürdüren ve yerel halklar tarafından çeşitli adlarla bilinen doğal bitkiler, sürdürülebilir yaşam açısından büyük bir öneme sahiptir. Bu bitkiler, besleyici niteliklerinin yanı sıra tıbbi faydalar da sunmaktadır. Farklı yörelerde birçok değişik isimle anılan Dardağan bitkiside halk hekimliğinde kullanılan bitkilerden birisidir. Çalışmada materyal olarak kullandığımız *C. tournefortii* meyve ve yapraklarına ait Toplam fenolik ve flavonoid madde miktarları tablo 1'de verilmiştir.

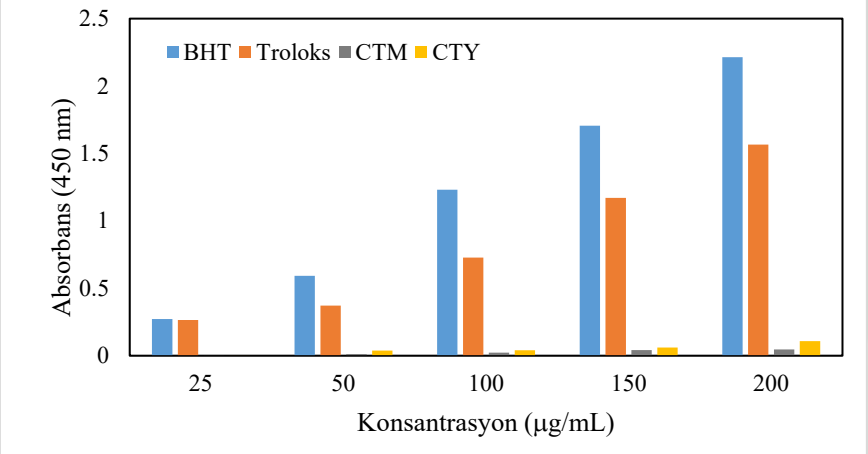
Tablo 1. *C. tournefortii* meyve ve yaprak ekstraktlarının toplam fenolik ve flavonoid madde miktarları ve IC_{50} değeri



Örnekler	TPC (mg GAE/g)	TFC (mg KE/g)	IC_{50} (µg /mL)
CTM	2.0±0.10	11.71±0.14	6158.10±81.67
CTY	18.63±1.52	21.93±1.53	1567.87±41.27

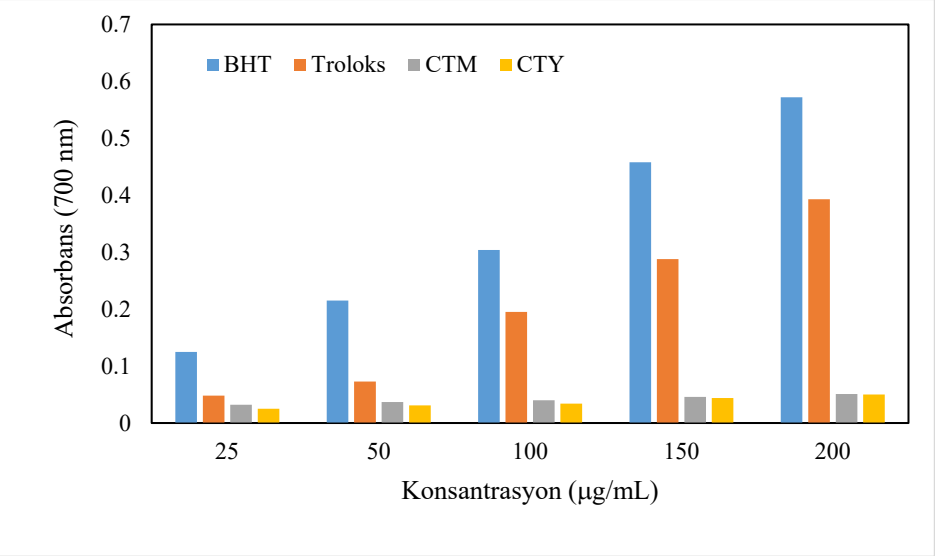
CTM: *C. tournefortii* meyve ekstraktı, **CTY**: *C. tournefortii* yaprak ekstraktı, **TPC**: Toplam fenolik madde miktarı, **TFC**: Toplam flavonoid madde miktarı, **IC_{50}**: radikalinin %50'sinin inhibisyonunu sağlayan konsantrasyon.

Keser ve ark. 2017 yılında *C. tournefortii* meyveleriyle yaptıkları çalışmada metanol ekstraktında toplam fenolik madde miktarını 43.38±0.43 mg GAE/g ekstrakt, toplam flavonoid madde miktarını ise 1239.49±2.79 µg CAT/g ekstrakt olarak bildirmişlerdir. Başka bir çalışmada toplam fenolik miktarının 6.674±0.0012 mg of GAE/gr ve toplam flavonoid miktarının 1.932± 0.002 mg of KE/gr olduğu rapor edilmiştir (Yıldırım ve ark., 2017). Farklı dardağan türünde yapılan çalışmada toplam fenol miktarının olgun meyve su ekstraktında 0.27 g GAE/100 g, olgunlaşmamış meyve su ekstraktında ise 0.05 g GAE/100 g bulunduğu belirlenmiştir (Ota ve ark., 2017). Daha önce Safari ve ark. (2023) *C. Australis* genotipinde toplam fenolik madde miktarını 1176,73 mg GAE/100 g - 398,27 mg GAE/100 g aralığında olduğunu bildirmiştir. Aynı çalışmada toplam flavonoid madde miktarı 313,19 mg CA/100 g - 197,41 mg CA/100 g aralığında gözlendiği rapor edilmiştir. Mevcut çalışmadaki sonuçlar farklılıklar göstermektedir. *C. tournefortii*'nin toplam fenol ve flavonoid madde miktarlarındaki değişim genotipe, çevresel faktörlere, ekstraksiyon çözücüsünün türüne ve hasattaki olgunluk derecesine bağlı olabilir.



Mevcut çalışmada incelenen ekstrakların radikal giderme aktivitesi DPPH yöntemi ile değerlendirilmiştir. DPPH yöntemi kolay ve kısa sürede yapılıyor olması nedeniyle bitkilerde radikal yakalama aktivitesinin belirlenmesinde yaygın olarak kullanılanılır (Acet ve Özcan, 2023). Bu yöntem farklı *Celtis* türlerinde de yaygın olarak kullanılmıştır. *C. tournefortii* ile yapılan mevcut çalışmada DPPH inhibisyon değerleri meyvelerde %2.04±0.28,

yapraklarda ise %6.35±1.00 olarak hesaplandı (Şekil 2). Yaprakların DPPH giderme gücü meyvelerde yüksek olmasına rağmen genel olarak düşük bir aktivite gözlendi. Türk *C. tournefortii*'nin farklı kısımlarıyla yapılan benzer bir çalışmada DPPH radikal giderici aktivite %25,32 ± 1,03 ile %94,92 ± 0,11 arasında değişmiştir (Gecibesler, 2019). Yıldırım ve ark. (2017) *C. tournefortii*'nin metanol özütünde DPPH inhibisyonunu %52.46 olarak bildirmiştir. DPPH radikal giderme aktivitesini belirlemenin bir diğer yolu da IC_{50} değerlerinin belirlenmesidir. Bunun için farklı konsantrasyonlarda radikal giderme aktiviteleri belirlenip hesaplanan % inhibisyon değerleri ve konsantrasyonlar kullanılarak grafik çizildi ve grafik denklemlerinden yararlanılarak IC_{50} değerleri hesaplandı (tablo 1). IC_{50} değerleri *C. tournefortii*'nin yaprak ekstraktında daha düşük değerde çıkmıştır. Buda yaprak ekstraktının DPPH giderme kapasitesinin meyve ekstraktından fazla olduğunun göstergesidir. Çünkü IC_{50} değeri ile aktivite ters orantılıdır. Mevcut çalışmada ekstraktların her ikiside oldukça düşük radikal giderme aktivitesi göstermiştir.



Şekil 2. *C. tournefortii* meyve ve yaprak ekstraktlarının ve BHT'nin konsantrasyona karşı % inhibisyon grafiği (**BHT:** 2,6-di-t-bütil-1-hidroksitoluen, **CTM:** *C. tournefortii* meyve ekstraktı, **CTY:** *C. tournefortii* yaprak ekstraktı)

C. tournefortii meyve ve yaprak ekstraktlarının indirgeme gücünün belirlenmesi için FRAP ve CUPRAC testleri uygulandı. Bunun için farklı konsantrasyonlarda ekstrak çözeltileri hazırlanıp testler ayrı ayrı uygulandı. Elde edilen absorbas değerleri ve konsantrasyonlar kullanılarak grafikler çizildi. Grafiklerde artan konsantrasyona paralel olarak absorbansın artması indirgemegücünün arttığını gösterir. Şekil 3'de görüldüğü gibi Cu^{2+}indirgeme kapasitesi oldukça düşük olmasına rağmen *C. tournefortii* yaprak ekstraktının indirgeme gücü meyve ekstraktından daha yüksektir. Benzer şekilde FRAP testi sonuçlarıda indirgeme gücünün düşük olduğunu göstermektedir (Şekil 4).

Şekil 3. *C. tournefortii* meyve ve yaprak ekstraktlarının ve standartların Cu^{2+} indirgeme gücünün karşılaştırılması (**BHT:** 2,6-di-t-bütil-1-hidroksitoluen, **CTM:** *C. tournefortii* meyve ekstraktı, **CTY:** *C. tournefortii* yaprak ekstraktı)

Şekil 4. *C. tournefortii* meyve ve yaprak ekstraktlarının ve standartların Fe^{3+} indirgeme gücünün karşılaştırılması (**BHT:** 2,6-di-t-bütil-1-hidroksitoluen, **CTM:** C. *tournefortii* meyve ekstraktı, **CTY:** *C. tournefortii* yaprak ekstraktı)

Troloks ile yapılan ölçüm sonuçları kullanılarak çizilen grafiğin eğimi ile numüneler için çizilen grafiklerin eğimleri oranlanarak CUPRAC ve FRAP aktiviteleri $TEAC_{CUPRAC}$ ve $TEAC_{FRAP}$ olarak ifade edilmiştir (tablo 2). Gıdalarda sentetik antioksidan olarak kullanılan BHT eşdeğer miktardaki Troloks'un yaklaşık 1.46 katı daha fazla CUPRAC antioksidan aktivitesi, 1.25 kat daha fazla FRAP aktivitesi göstermektedir Numunelerde ise eşdeğer miktardaki Troloksa en yakın değerin CUPRAC aktivitesinde 0.065 ile CTY'ye aitken FRAP aktivitesinde ise CTM numunesinde (0.2 kat) gözlenmiştir.

Tablo 2. Standart ve Bitki numuneleri için $TEAC_{CUPRAC}$ ve $TEAC_{FRAP}$ değerleri

	$TEAC_{CUPRAC}$	$TEAC_{FRAP}$
Troloks	1	1
BHT	1.46	1.25
CTM	0.039	0.2
CTY	0.065	0.05

***:** BHT: 2,6-di-t-bütil-1-hidroksitoluen, CTM: C. *tournefortii* meyve ekstraktı, CTY: *C. tournefortii* yaprak ekstraktı, $TEAC_{CUPRAC}$: Troloks eşdeğeri CUPRAC aktivitesi, $TEAC_{FRAP}$: Troloks eşdeğeri FRAP aktivitesi

Küresel ısınmanın etkisiyle dünyada ve ülkemizde yaşanabilecek su kıtlığı birçok sorunun ortaya çıkmasına neden olabilecektir. Bu bağlamada kuraklığa dayanan, tropikal iklimlerde yetişebilen bitkiler birçok ihtiyacı gidermek için kaynak olarak görülmektedir. Bu bitki türleri arasında *C. tournefortii* bitkiside yer almaktadır. Mevcut çalışmada *C. tournefortii* meyve ve yapraklarının metanol ekstraklarında toplam fenolik ve flavonoid madde miktarları belirlenmiş ve farklı yöntemler kullanılarak antioksidan kapasite değerlendirilmiştir. Ekstrakların antioksidan aktiviteleri düşük bulunmasına rağmen radikal giderme ve indirgeme gücünün var olduğu tespit edilmiştir. Elde edilen bulgular dardağan olarak isimlendirilen *C. tournefortii* bitkisinin fonksiyonel gıda bileşeni ve doğal antioksidan kaynağı olarak potansiyelini vurgulamakladır. Bitkinin ayrıca meyve, yaprak, tohum ile kabuklarının özellikle insan sağlığı ve halk hekimliğinde kullanılabilirliğinin belirlenebilmesi için farklı çözücüler ve yöntemlerinde kullanılacağı daha kapsamlı ve ileri araştırmalara ihtiyaç vardır.

Özet

Bu çalışmada, Kahramanmaraş koşullarında bezelye yetişme sezonunda 5 farklı ekim zamanı uygulanarak Deren, Elena ve Irmak 01 bezelye çeşitlerinin kuru tane kalite özelliklerine ekim zamanlarının etkisi araştırılmıştır. Araştırmada bölünmüş parseller deneme deseninde kurularak ekim zamanları ana parsellere, çeşitler alt parsellere yerleştirilmiştir. Araştırmada bakla bağlama süresi, hasat süresi, hasat indeksi, bin tane ağırlığı, protein oranı, nişasta oranı, yağ oranı incelenmiştir. İncelenen özelliklerden bakla bağlama süresi, protein oranı, yağ oranı yönünden çeşitlere, ekim zamanlarına, çeşit x ekim zamanı interaksiyonları arasında istatiksel olarak önemli farklılıklar kaydedilmiştir. Nişasta oranı göre çeşitler arasındaki farklılıklar istatistiki olarak önemli olmuştur. Çeşitlere ve ekim zamanlarına göre bin tane ağırlığı istatistiksel önemli farklılıklar göstermiştir. Deren çeşidinin protein oranı yönünden diğer çeşitlerden daha yüksek değere sahip olduğu, geç ekimlerin protein oranını artırdığı, bin tane ağırlığının geç ekimlerde azaldığı, geç ve erken ekimlerde hasat indeksinin azaldığı kaydedilmiştir.

***Anahtar kelimeler**: Bezelye, çeşit, ekim zamanları, kalite kriterleri, hasat indeksi.*

Effect of Planting Times on Quality Criteria of Pea (*Pisum sativum* L.) Varieties

Abstract

In this study, the effects of planting times on dry grain quality traits of Deren, Elena and Irmak 01 pea varieties were investigated by applying 5 different planting times in the pea growing season in Kahramanmaras conditions. In the trials, split plots were established in the experimental design and planting times were placed in main plots and varieties were placed in sub-plots. In the research, pod setting time, harvest period, harvest index, thousand grain weight, protein content, starch content and oil content were examined. Statistically significant differences were recorded planting times, and variety x planting time interactions in terms of the examined traits, such as pod setting time, protein content, and oil content of the varieties. The differences between the varieties according to starch content were statistically significant. Thousand grain weight showed statistically significant differences according to varieties and planting times. It was recorded that the Deren variety had a higher value than the other varieties in terms of protein content, late plantings increased the protein content, thousand grain weight decreased in late plantings, and harvest index decreased in late and early plantings.

***Keyword:** Peas, variety, planting times, quality criteria, harvest index.*

Giriş

Dünyanın her yerinde yetiştirilen ve baklagiller grubunda yer alan bezelye, son derece besleyicidir ve yüksek oranda sindirilebilir protein, karbonhidrat, mineral ve vitamin içermesi konserve olarak kullanılma özelliğinden dolayı, mutfaklarda hızlı şekilde yemeğe dönüştürülecek önemli bir gıda ürünüdür (Sharma, 2010). Bezelye (*Pisum sativum*) önemli bir besin bileşeni kaynağıdır ve protein, nişasta ve lif açısından zengindir. Bezelye proteini, düşük alerjenitesi, yüksek protein içeriği, bulunabilirliği, uygun fiyatlı olması ve sürdürülebilir bir üründen elde edilmesi nedeniyle küresel endüstride yüksek kaliteli bir protein ve işlevsel bir bileşen olarak kabul edilir. Ayrıca glütensiz ve genetiği üzerinde oynanmamış olması, bezelye proteini tahılların, unlu mamullerin, et, süt ürünlerinin, içeceklerin, besleyici ve teknolojik özelliklerini iyileştirmek için mükemmel bir bileşen olarak kullanılacak bir gıda ürünüdür (Shanthakumar ve ark. 2022). Son on yılda, bitki bazlı proteinlere olan talep artmaktadır. Bitkisel bazlı proteinler obezite, yüksek tansiyon ve diyabet riskini azaltmaktadır. Çoğu bitki bazlı protein için en az bir temel amino asit yoktur, ancak bezelye proteini lizin açısından zengindir ve bu da sağlıklı bir bağışıklık sistemini korumaya yardımcı olmaktadır (Huntrakul ve ark. 2020). Bezelye tarımında, su, kimyasallar ve düşük besin gereksinimine ihtiyaç duyulması yanı sıra atmosferik nitrojeni simbiyotik olarak sabitleme yeteneği nedeniyle sürdürülebilir tarım sistemlerinde büyük avantajlara sahiptir (MunierJolain and Carrouee 2003; Smytkiewicz ve ark. 2021). Bezelye yetiştiriciliğinde potansiyel verimi elde etmek için optimum ekim tarihi ve uygun çeşit gibi tarımsal uygulamalar öncelikli çalışılması gereken konulardır. Çeşitlerin uygun zamanda ekilmemesi verimde azalmaya ve kalitede düşmeye neden olmaktadır. Ekim zamanları bitkinin büyümesi ve

verimin üzerinde belirgin etkiye sahip olduğu gibi ekonomik kayıpta oluşturmaktadır (Ahmed ve ark., 2020). Ekim zamanlarının doğru tespiti bitkinin ekolojiyi de çok iyi kullanmasına ve çevre sağlığında katkı sağlamış olacaktır (Vange ve Obi, 2006). Akdeniz iklimine sahip bölgelerde bezelye ekimi Kasım ayından Mart ayına kadar sürebilir. Geç ekilen çeşitlerde çiçeklenme sırasında sıcaklık stresi maruz kalabilmektedir. Bu durum küçük tohumların oluşmasına ve yüksek protein birikimi neden olabilmektedir. Bezelye yetiştiriciliğinde verim kayıpları, çeşide, ekim zamanına, iklim koşullarına ve lokasyona bağlı olarak %30 ile %60 arasında değişmektedir (McDonald ve Peck, 2009). Uygun ekim tarihini, erken don hasarının olumsuz etkilerini azaltmaya ve bitkileri bakla oluşumu ve tane doldurma dönemleri gibi kritik aşamalarda oluşabilecek yüksek sıcaklıklardan zararını azalmaya yardımcı olabilir (Sümer 2024). Değişen iklim koşulları bölgelere uygun optimum ekim tarihin seçiminin araştırmalarla ortaya konmasını gerektirmektedir. Bu nedenle Kahramanmaraş koşullarında üç bezeyle çeşidine beş farklı ekim zamanı uygulanarak, uygun ekim zamanı belirlemeye çalışılmıştır.

Materyal ve Metot

Denemede materyal olarak Elena, Deren ve Irmak 01 bezelye çeşitleri kullanılarak, Kahramanmaraş koşularında Kasım-2022, Aralık-2022, Ocak-2023, Şubat-2023 ve Mart-2023 olmak üzere beş farklı ekim zamanı uygulanmıştır. Bölünmüş deneme deseninde kurulan denemede ekim zamanları ana parsellere, çeşitler alt parsellere yerleştirilmiştir. Üç tekerrürlü kurulan denemede parsel uzunluğu 5 m sıra arsı 50 cm, sıra üzeri 8 cm olacak şekilde 4 sıra olarak elle ekilmiştir. Ekim sırasında dekara 13 kg olacak şekilde (18-46 DAP) taban gübresi uygulanmıştır. Azotlu gübresi üst gübre olarak bitki boyu 10-15 cm iken net 8 kg da^{-1} azot düşecek verilmiştir. Bezelye ekimleri hava koşulları ve toprağın nem durumu dikkate alınarak her ayın 15'den sonra ekimler yapılmıştır. Kasım, Aralık, Ocak ekimlerinde toprak nemi yeterli olurken, Şubat ve Mart ekimlerinde çimlenmeyi sağlamak için sulama yapılmıştır. Bitkinin gelişme sürecinde toprak nemi ve bitki durumu gözlenerek Nisan ve Mayıs aylarında damla sulama uygulanmıştır. Nisan ayının sonunda Mildiyö hastalığına karşı (%64 mancozeb + %8 metalaxy) 40 g da-1 ve 60 g da-1 bakırsülfat çözeltisi sırt pompası ile uygulanmıştır. Mayıs ayında da beyaz sinek için (25 ml $da^{-1)}$ 141 g lt^{-1} Thiamethoxam + 106 g lt^{-1} lambda cyhalothrin kullanılarak mücadele edilmiştir. Hasat, yaprakların ve baklalarının kuruduğu, ayrıca baklaları sallayınca tanelerin baklalar içinde hareket seslerinin hissedilmesiyle geçekleştirilmiştir. Hasat sonrasında elde edilen kuru tane örnekleri değirmende öğütülerek un haline getirilmiştir. Un örnekleri Samsun On dokuz Mayıs Üniversitesi laboratuvarında FOSS 6500 NIR sistem cihazında WINISI paket programları kullanılarak protein, nişasta, yağ oranı belirlenmiştir. Araştırmada tanenin bin tane ağırlığı, hasat indeksi, hasat zamanı, protein oranı, nişasta oranı, yağ oranı incelenmiştir. Denemenin yürütüldüğü alanının toprağı hafif alkali ve tuzlu, kireçli, potasyum ve fosfor yeterli düzeyde, organik maddece orta, killi bünyeye sahip yapıdadır. Denemenin yürütüldüğü bölgeye ait bazı iklim verileri çizelge 1. verilmiştir.

Çizelge 1. Deneme yürütüldüğü Kahramanmaraş iline ait bazı iklim verileri

Aylar	Yağış (mm)	Nem (%)	Sıcaklık min.(°C)	Sıcaklık mak.(°C)	Sıcaklık ort.(°C)
Kasım 2022	65,0	77,1	5,0	27,4	13,0
Aralık 2022	34,8	89,1	3,6	19,6	8,8
Ocak 2023	57,4	82,5	-1,0	17,4	5,6
Şubat 2023	67,0	65,5	-6,7	26,0	4,8
Mart 2023	138,4	75,3	1,0	27,3	12,1
Nisan 2023	66,6	73,9	4,3	30,4	14,4
Mayıs 2023	30,0	57,9	9,8	35,5	19,9
Haziran 2023	0,4	50,8	14,6	39,6	25,8

Anonim (2024).

Çizelge 1'den denemenin yürütüldüğü bölgeye en az yağışın Haziran ayında düştüğü, onu Mayıs ayı ikinci sırada ve Aralık ayı üçüncü sırada izlediği ve en yüksek yağışın Mart ayında düştüğü görülmektedir. Minimum sıcaklığın Ocak ve Şubat ayında sıfırın altında seyrettiği, maksimum sıcaklığın Nisan ayı dahil olmak üzere 30 °C'nin üstünde olduğu kaydedilmiştir.

Araştırma sonunda elde edilen veriler JUMP paket programı kullanılarak, varyans analizi bölünmüş parseller deneme desenine göre yapılmıştır. Varyans analizinde elde edilen ortalamalarda çoklu Duncan karşılaştırma testi uygulanmıştır.

Bulgular ve Tartışma

Kahramanmaraş merkezde bezelye yetişme sezonu dikkate alınarak Elena, Deren ve Irmak 01 bezelye çeşitleri beş farklı ekim zamanında ekilerek yetiştirilen bezelye bitkisinin hasat süresi (gün), hasat indeksi (%), bakla bağlama

süresi (gün), bin tane ağırlığı (g), protein oranı (%), nişasta oranı (%) ve yağ oranı (%) özellikleri incelenmiştir. İncelenen özelliklere ait sonuçlar ve laboratuvar analizleri alt başlıklar halinde sıralanmıştır.

Hasat Süresi (gün)

Kahramanmaraş koşullarında farklı bezelye çeşitleri ve ekim zamanları uygulanarak yürütülen çalışmada hasat indeksi yönünden çeşitler, ekim zamanları ve çeşit x ekim zamanı interaksiyonunun istatistiksel olarak önemli olduğu, araştırmada elde edilen ortalamalar ve grupları Çizelge 2'de verilmiştir.

Çizelge 2. Farklı ekim zamanı uygulanan bezelye çeşitlerinin hasat sürelerine ait ortalamalar ve Duncan testine göre oluşan grupları

Ekim zamanları	Hasat Süresi (gün)			
	Elena	Deren	Irmak 01	Ort.
Kasım	196,00 a	195,00 b	195,00 b	195,33 a
Aralık	176,00 d	175,00 e	177,00 c	176,00 b
Ocak	141,00 g	141,00 g	142,00 f	141,33 c
Şubat	111,00 ı	112,00 h	112,00 h	111,66 d
Mart	90,00 k	91,00 j	90,00 k	90,33 e
Ortalama	142,80 b	142.80 b	143,20 a	

Yürütülen araştırmada kullanılan çeşitler ve ekim yapılan tarihlere göre bitkilerin hasat olgunluğuna gelme süreleri değişiklik göstermiştir. Kullanılan çeşitler arasında Irmak 01 çeşidi 143.20 gün ile hasat olgunluğuna gelirken, Elena ve Deren çeşidi 142.80 gün ortalaması ile hasat olgunluğuna gelmiştir. Ekim zamanlarına göre bitkilerin hasat süreleri önemli derecede farklılık göstermiş olup, en uzun hasat süresi 195,33 gün ile Kasım ayında yapılan ekimlerde görülmüştür. Aralık ayında yapılan ekimler ortalama 176,00 günde hasat olgunluğuna gelirken onu üçüncü sırada 141,33 gün ile Ocak ayında yapılan ekimler izlemiştir. Şubat ayında yapılan ekimler 111,66 gün ortalaması ile hasat olgunluğuna gelirken, en kısa hasat süresi 90,33 gün ile Mart ayında yapılan ekimlerde görülmüştür. Çeşit x ekim zamanları interaksiyonlarına göre bitkilerin hasat süresi önemli farklılıklar göstermiştir. En uzun hasat süresi 196,00 gün ile Elena çeşidinin Kasım ayı ekimlerinde elde edilirken, Deren ve Irmak çeşidinin Kasım ayında yapılan ekimleri 195,00 gün ile ikinci sırada yer almıştır. En düşük hasat süresi ise 90,00 gün ile Elena ve Irmak 01 çeşitlerinin Mart ayı ekimlerinde görülürken, Deren çeşidinin Mart ayında yapılan ekimi 91,00 gün ortalamada hasat olgunluğuna gelmiştir. Çeşit x ekim zamanları interaksiyonlarında, aynı ekim zamanlarında kullanılan çeşitler arasında ciddi farklılıklar bulunmamaktadır fakat aynı çeşitlerin çeşitlerin farklı ekim zamanlarında ekilmesi hasat süresini önemli derecede etkilemektedir.

Hasat İndeksi (%)

Farklı ekim zamanlarının Kahramanmaraş koşullarında farklı bezelye çeşitlerine uygulanarak yürütülen çalışmada hasat indeksi yönünden ekim zamanları ve çeşit x ekim zamanı interaksiyonunun istatistksel olarak (0.01) önemli olduğu, araştırmada elde edilen ortalamalar ve grupları Çizelge 3'te verilmiştir.

Çizelge 3. Farklı ekim zamanı uygulanan bezelye çeşitlerinin hasat indeksi ait ortalamalar ve Duncan testine göre oluşan grupları

Ekim zamanları	Hasat İndeksi (%)			
	Elena	Deren	Irmak 01	Ort.
Kasım	46,02 bcdef	41,15 gh	45,29 cdef	44,15 c
Aralık	46,40 abcde	48,36 ab	45,03 def	44,60 b
Ocak	48,60 ab	47,78 abc	48,64 a	48,34 a
Şubat	47,88 ab	41,81 gh	47,35 abcd	45,68 b
Mart	44,72 ef	40,83 h	43,50 fg	43,02 c
Ortalama	46,72	43,99	45,96	

Yapılan araştırmada kullanılan bezelye çeşitleri, istatistiksel olarak önemli farklılıklar oluşturmamıştır. Elena, Irmak 01, Deren çeşitleri sırayla %46.76, %45,96, %43,99 hasat indeksi diğerlerine sahip olmuştur. Ekim zamanlarının hasat indeksleri ortalamaları, istatistiksel olarak önemli bulunmamış olup, %44,15-45,68 arasında değişen değerler oluşturmuşlardır. En yüksek % 48.34 hasat indeksi ile Ocak ayı ekiminde kaydedilmiştir. Aralık ve Şubat ayı ekimleri istatistiki olarak aynı grupta yer alarak diğer ekimlerden önemli farklılıklar göstermiştir. En düşük hasat indeksi Mart ayı ekiminden elde edildiği ve Kasım ayı ekimiyle de aynı istatistiki grupta yer alarak diğer ekim zamanları arasında önemli farklılık oluşturduğu kaydedilmiştir. Çeşit x ekim zamanları interaksiyonlarının hasat indeksleri incelendiğinde, en yüksek hasat indeksleri %48,64 ile Irmak 01 çeşidinin Ocak ayı, %48.60 ile Elena Ocak ayı, %47.35 hasat indeksi ile Irmak 01 çeşidinin Şubat ayı ekimlerinden, %48,36 ile

Deren çeşidinin Aralık ayı ekimlerinden, %47,88 ile Elena çeşidinin Şubat ayı ekimlerinden ve %47,78 ile Deren çeşidinin Ocak ayı, %46.40 ile Elena Aralık ayı ekimlerinden elde edildiği ve aralarında istatistiki olarak fark bulunmadığı tespit edilmiştir. En düşük hasat indekslerinin, %40.83 ile Deren çeşidinin Mart ekiminden elde edildiği ve Deren çeşidinin Şubat ayı ekimi arasında fark oluşturmadığı kaydedilmiştir (Çizelge 6.) Daha önce yapılan çalışmalarda bezelyede hasat indeksini Kılıç (2017), Giresun koşullarında yerel bezelye çeşitlerinin %53-73, Özaktan ve ark. (2022), Kayseri koşullarında farklı sulama faktörlerinde %38-56 arasında değişim gösterdiğini tespit edilmiştir. Önceki yapılan çalışmalardan da anlaşıldığı gibi hasat indeksinin çeşit özelliğinin yanı sıra çevresel etkinin katkısını daha yüksek olduğu görülmektedir.

Bakla Bağlama Süresi (gün)

Bezelye çeşitlerine farklı ekim zamanları uygulanarak yürütülen çalışmada bağla bağlama süresi yönünden ekim zamanları (0.05), çeşit, çeşit x ekim zamanı interaksiyonunun istatistksel olarak (0.01) önemli olduğu, araştırmada elde edilen ortalamalar ve grupları Çizelge 4'te verilmiştir.

Çizelge 4. Farklı ekim zamanı uygulanan bezelye çeşitlerinin bakla bağlama sürelerine ait ortalamalar ve Duncan testine göre oluşan grupları.

Ekim zamanları	Bakla Bağlama Süresi (gün)			
	Elena	Deren	Irmak 01	Ort.
Kasım	143,33 b	134,33 c	150,66 a	142,77 a
Aralık	128,66 d	118,00 e	131,00 d	125,88 b
Ocak	95,66 f	90,33 g	97,00 f	94,33 c
Şubat	82,66 h	77,33 ı	84,00 h	81,33 d
Mart	73,33 jk	71,33 k	74,33 j	73,00 e
Ortalama	104,73 b	98,26 c	107,40 a	

Araştırmada kullanılan bezelye çeşitleri, bakla bağlama süreleri yönünden istatistiksel olarak farklılık oluşturmuştur. En geç bakla bağlama süresi ortalaması 107,40 gün ile Irmak 01 çeşidinde görülürken, onu ikinci sırada 104,73 gün ile Elena çeşidi izlemiştir. En erken bakla bağlama süresi ise 98,26 gün ile Deren çeşidinde kaydedilmiş olup, tüm bezelye çeşitleri farklı istatistiksel grupta yer almıştır. Ekim yapılan tarihler incelendiğinde, Kasım ayından Mart ayına doğru bakla bağlama süresinin giderek kısaldığı görülmektedir. En geç bakla bağlama süresi 142,77 gün ortalama ile Kasım ayında yapılan ekimlerde görülürken onu sırasıyla 125,88 gün ile Aralık, 94,33 gün ile Ocak, 81,33 gün ile Şubat ayında yapılan ekimler izlemiştir. En erken bakla bağlama süresi ortalaması, 73,00 gün ile Mart ayında yapılan ekimlerde görülürken, tüm ekim zamanları birbirinden farklı istatistiksel grupta yer almıştır. Çeşit x ekim zamanları interaksiyonlarına göre bakla bağlama süreleri önemli farklılıklar göstermiştir. Irmak 01 çeşidinin Kasım ayında yapılan ekimi 150,66 gün olurken, onu 143,33 gün ile Elena çeşidinin Kasım ayı ekimi ve 134,33 gün ile Deren çeşidinin Kasım ayı ekimi izlediği ve farklı istatistiki grupları oluşturdukları belirlenmiştir. En erken bakla bağlama süresi 71,33 gün ile Deren çeşidinin Mart ay ekiminde görüldüğü ve onu 73,33 ile gün izleyen Elena çeşidinin Mart ayı ekimi hariç diğer çeşit x ekim zamanı interaksiyonlarından istatistiksel olarak önemli farklılıklar oluşturduğu akydedilmiştir. Diğer çeşit x ekim zamanı interaksiyonlarının bakla bağlama süreleri 74,33-131,00 gün arasında değişiklik göstermiştir. (Çizelge 4.). Luthra ve ark. (2024), Hindistan'ın Prayagraj bölgesinde 25 bezelye çeşidiyle yapılan çalışmada %50 bakla bağlama süresinin 33,92-68,23 gün arasında değiştiğini kaydetmişlerdir. Bezelye bitkisi ılıman iklim bitkisi olduğu için soğuk ve sıcağa hassasiyeti gelişme evrelerindeki tepkisiyle göstermektedir.

Bin Tane Ağırlığı (g)

Kahramanmaraş koşullarında farklı bezelye çeşitleri ve ekim zamanları uygulanarak yürütülen çalışmada bin tane ağırlığı yönünden çeşitler ve ekim zamanları istatistiksel olarak 0.01 düzeyinde önemli olduğu, araştırmada elde edilen ortalamalar ve grupları Çizelge 5'de verilmiştir.

Çizelge 5. Farklı ekim zamanı uygulanan bezelye çeşitlerinin bin tane ağırlığına ait ortalamalar ve Duncan testine göre oluşan grupları

Ekim zamanları	Bin Tane Ağırlığı (g)			
	Elena	Deren	Irmak 01	Ort.
Kasım	145,43	180,59	228,00	184,67 ab
Aralık	163,32	182,70	234,60	193,54 a
Ocak	175,49	177,34	236,75	196,52 a
Şubat	161,33	168,00	206,67	178,67 b
Mart	134,48	152,85	186,36	157,90 c
Ortalama	156,01 c	172,30 b	218,48 a	

Araştırmada denemeye alınan bezelye çeşitleri, bin tane ağırlıklarına göre istatiksel üç grup oluşturmuştur. Bin tane ağırlığında sırasıyla en yüksek değer 218,48 g ile Irmak 01 çeşidinde, onu 172,30 g ile Deren çeşidinin ve en düşük 156,01 g ile Elena çeşidinin izlediği görülmüştür. Ekim zamanlarına göre bin tane ağırlığı istatistiksel olarak üç grup ve bir geçiş grubuna sahip olmuştur. Bin tane ağırlığında en yüksek değer 196.52 g olarak Ocak ayı ekiminde kaydedildiği, onu ikinci sırada 193.54 g ile Aralık ekiminin, üçüncü sırada 184.67 g ile kasım ekimin izlediği ve aralarında istatistiki farklılık oluşturmadığı görülmüştür. Mart ayı ekimi 152.90 g ile en düşük bin tane ağırlığına sahip diğer ekim zamanlarından önemli farklılıklar oluşturduğu kaydedilmiştir. Şubat ayı ekimi bin tane ağırlığında ikinci en düşük bin tane ağırlığına sahip olarak farklı grupta yer almıştır. Çeşit x ekim zamanı interaksiyonları yönünden bin tane ağırlıkları arasında istatiksel farklılıklar görülmemiştir. Irmak 01 çeşidi Ocak ayı ekiminde 236,75 g ile en yüksek bin tane ağırlığına sahip olduğu, Elena çeşidi Mart ayı ekiminde 134,48 g ile en düşük bin tane ağırlığı gösterdiği kaydedilmiştir. Bin tane ağırlığı değerleri diğer interaksiyonlarında 145,43-234,60 g arasında değiştiği belirlenmiştir (Çizelge 5.). Bezelye ile daha önce yapılan çalışmalarda bin tane ağırlığı değerlerinin Ceyhan ve ark. (2005), Konya koşullarında 101-236 g, Toğaç ve ark. (2006), Van koşullarında 141,4-143,6 g, Timuroğlu ve ark. (2004), Ankara koşullarında yemlik bezelye hatlarında ilk sene 125-228 g arasında, ikinci sene 102-165 g arasında, Karayel (2006), Samsun ekolojik 103-364 g arasında olduğunu, Khan ve ark. (2013), Pakistanda 82,33-171 g, Kılıç (2017), Giresun yöresinde 128,39-2443,82 g, Gali ve ark. (2019), 171-225 g, Özaktan ve ark. (2022), Kayseri koşullarında 144,7-163,2 g arasında değiştiğini kaydetmişlerdir. Daha önceki araştırmalardan, bin tane ağırlığının çeşit karakteri yanı sıra iklim, çevresel faktörler ve uygulama faktörlerinden etkilendiği anlaşılmaktadır. Çalışmada elde edilen araştırma sonuçlar çeşit ve çevre etkisini açıklamaktadır. En düşük bin tane ağırlığının Mart ayı ekiminde elde edilmesi, sıcaklıkların artmasıyla bitkinin fizyolojik olumunun kısalması bin tanenin ağırlığının düşmesine neden olmuştur.

Protein Oranı (%)

Kahramanmaraş koşullarında farklı bezelye çeşitleri ve ekim zamanları uygulanarak yürütülen çalışmada protein oranı yönünden çeşitler, ekim zamanları ve çeşit x ekim zamanı interaksiyonunun istatistiksel olarak önemli olduğu, araştırmada elde edilen ortalamalar ve grupları Çizelge 6'da verilmiştir.

Çizelge 6. Farklı ekim zamanı uygulanan bezelye çeşitlerinin protein oranına ait ortalamalar ve Duncan testine göre oluşan grupları

Ekim zamanları	Protein Oranı (%)			
	Elena	Deren	Irmak 01	Ort.
Kasım	24,30 e	26,46 bcd	22,89 f	24,55 c
Aralık	24,45 e	26,15 cd	24,46 e	25,02 c
Ocak	24,55 e	27,54 ab	25,41 de	25,83 b
Şubat	24,70 e	27,96 a	26,12 cd	26,26 ab
Mart	26,15 cd	27,43 ab	27,08 abc	26,88 a
Ortalama	24,83 b	27,11 a	25,19 b	

Yürütülen araştırmada, protein oranı yönünden kullanılan bezelye çeşitleri arasında istatistiki olarak 0.01 önem seviyesinde farklılıklar bulunmuştur. Çeşitler istatistiki olarak iki grup oluşturmuştur. En yüksek %27.24 ile protein oranı ile Deren çeşidi ilk sırayı almıştır. Elena ve Irmak 01 çeşitlerin sırasıyla %24, 25.19 protein oranıyla ikinci istatiksel grupta yer almıştır. Protein oranı ortalamaları incelendiğinde ekim zamanlarına göre, istatistiksel olarak üç ana grup ve bir geçiş grubu oluşturmuştur. En yüksek protein oranı, %26,88 ile Mart ayında yapılan ekimlerde görülürken, onu ikinci sırada %26,26 ile Şubat ayında yapılan ekimler izlemiştir ve aralarında istatistiksel olarak fark bulunmamaktadır. En düşük protein oranı, %24,55 ve %24,80 protein oranları ile Kasım ve Aralık ayında yapılan ekimlerde belirlenmiş olup, aynı istatistik grupta yer almışlardır. Çeşit x ekim zamanı interaksiyonlarında protein oranları %22,89-28,20 arasında değişmektedir. En yüksek protein oranı, %28,20 ile Deren çeşidinin Ocak ayında yapılan ekiminde görülmüş olup, Deren çeşidinin Şubat ve Mart ayı ekimleri, Irmak çeşidinin Mart ayı ekimi ile arasında istatistiksel olarak fark görülmemiştir. Çeşit x ekim zamanı interaksiyonlarında en düşük protein oranı %22,89 ile Irmak 01 çeşidinin Kasım ayında yapılan ekiminde belirlenmiştir ve Elena çeşidinin Aralık ayında yapılan ekimi ile arasında istatistiksel olarak fark olmadığı görülmektedir (Çizelge 6.).

Bezelyeyle ilgili daha önce yapılan çalışmalarda protein oranının Timuroğlu ve ark. (2004), Ankara koşullarında yemlik bezelye hatlarında birinci yıl %16-19, ertesi yıl %17-23, Karayel (2006), Samsun koşullarında %16,3-23,6, Kılıç (2017), Giresun bölgesinde %19,86-28,12, Gali ve ark. (2019), %22,8-25,4, Özaktan ve ark. (2022), Kayseri koşullarında sulamanın etkisini araştırdıkları çalışmada, %32,45-34,59, Volobueva ve ark (2024), Rusya-Oryol bölgesinde %20-24,9 arasında değiştiğini belirtmişlerdir. Sümer (2024), Aydın koşullarında Deren ve Irmak 01 çeşitlerini kapsayan beş bezelye çeşidinin 15 Kasım, 30 Kasım, 15 Aralık ekimlerinde sırasıyla protein oranının %27,75, %26,55 ve %26,67 olduğunu ve ortalama protein oranının %25,16-28,48 arasında değişim gösterdiğini

tespit etmiştir. Yürütülen çalışmada protein oranlarının ekim zamanlarının gecikmesiyle artış gösterdiği ve protein oranı üzerindeki genetik faktörlerin etkisi olmakla birlikte çevresel faktörlerden de etkilendiğini göstermektedir.

Nişasta Oranı (%)

Farklı bezelye çeşitleri ve ekim zamanları uygulanarak Kahramanmaraş koşullarında yürütülen çalışmada nişasta oranı yönünden çeşitler istatistiksel olarak 0.05 önem düzeyinde önemli olduğu tespit edilmiştir. Araştırmada elde edilen ortalamalar ve grupları Çizelge 3'de verilmiştir

Çizelge 7. Farklı ekim zamanı uygulanan bezelye çeşitlerinin nişasta oranına ait ortalamalar ve Duncan testine göre oluşan grupları

Ekim zamanları	Nişasta Oranı (%)			
	Elena	Deren	Irmak 01	Ort.
Kasım	47,45	46,28	50,84	48,19
Aralık	48,45	47,66	49,60	48,57
Ocak	48,66	46,82	49,64	48,37
Şubat	49,20	46,56	48,41	48,06
Mart	47,35	47,74	47,33	47,47
Ortalama	48,22 ab	47,01 b	49,16 a	

Çalışmada kullanılan bezelye çeşitleri, nişasta oranı bakımından önemli farklılıklar göstermiştir. En yüksek nişasta oranı %49,16 ile Irmak 01 çeşidinde görülürken, %48,22 nişasta oranı ile ikinci sırada bulunan Elena çeşidi ile aynı istatistiksel grupta yer almıştır ve aralarında istatistiksel bir fark oluşmamıştır. En düşük nişasta oranı ise %47,01 ile Deren çeşidinde belirlenmiş olup, diğer iki çeşitten farklı bir istatistiksel grupta yer almıştır. Ekim zamanları arasında nişasta oranı özelliğinde önemli bir fark bulunmamış olup, en yüksek nişasta oranı %41,91 ile Aralık ayında yapılan ekimlerde, en düşük nişasta oranı ise %40,81 ile Mart ayında yapılan ekimlerde kaydedilmiştir. Çeşit x ekim zamanları interaksiyonlarında en yüksek nişasta oranı %50,84 ile Irmak 01 çeşidinin Kasım ayı ekiminden elde edilirken, en düşük nişasta oranı %26,28 ile Deren çeşidinin Kasım ayı ekiminde belirlenmiştir (Çizelge 7.).

Gali ve ark. (2019), 135 bezelye materyalinde nişasta oranını %38,7-52,2, Volobuevaa ve ark (2024), Rusya-Oryol yöresinde biyolojik ürünler ile büyüme düzenleyicilerinin uyguladığı iki bezelye çeşidine nişasta formunda oluşan karbonhidratların %24-49 arasında değiştiğini kaydetmişlerdir. Nişasta oranı genetik faktörlerin etkisi yanı sıra çevresel faktörlerden de etkilenebilmektedir.

Yağ Oranı (%)

Elene, Deren ve Irmak 01 bezelye çeşitleri Kahramanmaraş koşullarında beş farklı zamanda ekilerek yetiştirilmesi sonucunda yağ oranı yönünden çeşitler, ekim zamanları ve çeşit x ekim zamanı interaksiyonu 0.01 önem düzeyinde istatistiksel olarak önemli bulunduğu kaydedilmiştir. Araştırma sonucunda elde edilen ortalamalar ve grupları Çizelge 8'de verilmiştir.

Çizelge 8. Farklı ekim zamanı uygulanan bezelye çeşitlerinin yağ oranına ait ortalamalar ve Duncan testine göre oluşan grupları.

Ekim zamanları	Yağ Oranı (%)			
	Elena	Deren	Irmak 01	Ort.
Kasım	1,76 c	2,40 a	1,54 ef	1,90 ab
Aralık	1,85 c	2,39 a	1,63 de	1,95 a
Ocak	1,80 c	2,20 b	1,62 de	1,87 b
Şubat	1,76 c	2,18 b	1,42 fg	1,79 c
Mart	1,75 cd	2,14 b	1,40 g	1.76 c
Ortalama	1,78 b	2,26 a	1,52 c	

Yürütülen araştırmada kullanılan bezelye çeşitleri, yağ oranları bakımından incelendiğinde, üç farklı istatistiksel grup oluştuğu görülmektedir. Deren çeşidi, %2,26 yağ oranıyla en fazla yağ oranına sahip çeşit olurken, onu ikinci sırada %1,78 yağ oranı ile Elena çeşidi izlemiştir. Denemede kullanılan çeşitler arasında en düşük yağ oranına sahip çeşit, %1,52 ile Irmak 01 çeşidi olmuştur. Ekim zamanları ortalamaları, istatistiksel olarak üç ana grup ve bir geçiş grubu oluşturmuştur. En yüksek yağ oranı, %1,95 ile Aralık ayında yapılan ekimlerden elde edilirken, Kasım ayında yapılan ekimlerden elde edilen %1,90 yağ oranı ikinci sıradadır ve bu iki ekim zamanı arasında istatistiksel olarak fark bulunmamaktadır. En düşük yağ oranına sahip ekim zamanları, %1,79 ile Mart ayı ve %1,76 ile Şubat ayı ekimlerinden elde edilmiştir. Bu iki ekim zamanı istatistiksel olarak aynı grupta yer aldığı için, aralarında istatistiksel olarak fark bulunmamaktadır. Çeşit x ekim zamanları interaksiyonlarında en yüksek yağ

oranları, %2,40 ile Deren çeşidinin Kasım ayında yapılan ekimlerinde ve %2,39 ile Deren çeşidinin Aralık ayında yapılan ekimlerinde kaydedilmiştir. Bu iki çeşit x ekim zamanı interkasiyonu, aynı istatistiksel grupta yer almış olup, aralarında istatistiksel olarak fark bulunmamaktadır. Yağ oranı en düşük çeşit x ekim zamanları interaksiyonları incelendiğinde, %1,40 yağ oranı ile Irmak 01 çeşidinin Mart ayında ekimleri ve %1,42 yağ oranı ile Irmak 01 çeşidinin Şubat ayında yapılan ekimleri, diğer çeşit x ekim zamanları interaksiyonlarının gerisinde kalmıştır. Diğer çeşit x ekim zamanları interaksiyonlarının yağ oranlarının %1,62-2,20 arasında değiştiği Çizelge 8'den görülmektedir. Volobuevaa ve ark (2024), Rusya-Oryol bölgesinde biyolojik ürünlerin ve büyüme düzenleyicilerin iki bezelye çeşidine uygulamalarında yağ oranın %1,5-2,0 arasında değiştiğini belirtmişlerdir. Yürütülen araştırmada yağ oranının ekim zamanının gecikmesiyle azaldığı ve yağ oranları çeşidin genetik özelliğinin yanı sıra, yürütülen araştırmada çevresel faktörlerden etkilendiğini açıklamaktadır.

Sonuç

Yürütülen çalışmada, Deren, Elena ve Irmak 01 bezelye çeşitleri Kahramanmaraş koşullarında Kasım Aralık, Ocak, Şubat ve Mart aylarında ekim yapılarak, tane kalite kriterleri yönünden uygun ekim zamanının belirlenmesi amaçlanmıştır. Araştırmada hasat süresi, bakla bağlama süresi, hasat indeksi, bin tane ağırlığı, nişasta oranı, protein oranı, yağ oranı incelenmiştir. Bezelye çeşitleri nişasta oranlarına, protein oranlarına, yağ oranlarına, bakla bağlama sürelerine göre önemli derecede farklılıklar göstermiştir. Ekim zamanlarını, çeşit x ekim zamanı interaksiyonları bin tane ağırlığı, protein oranları, yağ oranları, bakla bağlama süreleri üzerinde önemli etkide bulunmuştur. Ekim zamanlarının gecikmesi hasat süresini, bakla bağlama süresini kısalırken protein oranını artığı kaydedilmiştir. Deren çeşidinin erkenci, protein ve yağ oranın daha yüksek, nişasta oranının oranın düşük, Irmak 01 çeşidinin bin tane ağırlığı ve nişasta oranının yüksek, yağ oranının düşük olduğu belirlenmiştir. Yürütülen çalışmanın bölge ekolojisi yönünden önemli olduğu, erken ekimin önerilmesi ve tekrarlanmasının yararlı olacağı kabul edilmiştir.

Spatiotemporal Dynamics of Li, Mn, Ni, and Ba Concentrations in Sediments of Lotic Habitats in the Biga Peninsula, Türkiye

Cem Tokatlı

Trakya University, Evrenos Gazi Campus, Edirne / Türkiye
e-mail: cemtokatli@trakya.edu.tr

Abstract

Sediments, which contain a wealth of various toxic and essential elements, play a very important role in our freshwater habitats. Although some elements are essential and needed by living things, it is known that long-term and large-scale exposure to them can be harmful, just like non-essential toxic elements. The Biga Peninsula, situated in the northwestern region of Anatolia, possesses significant agricultural, industrial, and touristic potential. This study was carried out to determine the spatiotemporal variations of lithium (Li), manganese (Mn), nickel (Ni) and Barium (Ba) levels in sediments of the riverine ecosystems located in the Biga Peninsula. Five riverine ecosystems were selected for the study, and sediment samples were collected during both the dry and wet seasons of 2022–2023 to assess seasonal variations. According to the results of this research, the annually average concentrations of investigated elements in sediments of the riverine ecosystems located in the Biga Peninsula were found in the order of Mn (1076 mg/kg) > Ba (93 mg/kg) > Ni (21 mg/kg) > Li (14 mg/kg). While no significant seasonal differences were detected in Mn, Ni and Ba accumulations, it was recorded that the average Li values in the sediments increased approximately 8 times during the wet season.

Keywords: *Biga Peninsula, Creeks, Sediment quality*

Introduction

Essential elements, such as manganese, are crucial nutrients that play a vital role in the healthy growth and development of all living organisms. However, excessive concentrations of these elements can have detrimental effects on the environment, similar to toxic elements like lithium, nickel, and barium. Therefore, maintaining toxic elements below threshold levels and ensuring a balanced presence of essential elements in aquatic habitats are critical for environmental protection (Haq et al., 2023; Haque et al., 2023; Muhammad et al., 2025). Freshwater sediments serve as key transporters of various pollutants within aquatic ecosystems and provide essential environmental data (Muhammad et al., 2024; Yüksel et al., 2024; Tokatlı et al., 2025). Consequently, analysing the elemental composition of surface sediments is of great importance for understanding and monitoring ecological health (Varol et al., 2022; Ustaoğlu et al., 2022; Köse et al., 2023).

The Biga Peninsula, situated in the northwestern part of Anatolia, possesses considerable agricultural, industrial, and touristic potential due to its fertile soils, strategic geographic location, and abundant natural resources. The peninsula forms part of the eastern connection between Anatolia and Rumelia, divided by the Çanakkale Strait. The region's favourable climate and productive soil support diverse agricultural activities, including the cultivation of various crops, fruits, and vegetables, which substantially contribute to both local and national economies. Agriculture plays a dominant role in the local economy, with the development of agricultural activities leading to the establishment of numerous industrial facilities engaged in agriculture-based production. Additionally, the presence of developing industrial zones and manufacturing sectors fosters economic growth, providing employment opportunities and enhancing regional trade. Furthermore, the peninsula's historical heritage, scenic landscapes, and coastal attractions make it an appealing destination for tourism, drawing visitors with an interest in cultural, historical, and nature-based experiences (Anonymous, 2021; Tokatlı et al., 2023; 2024; Varol and Tokatlı, 2024; https://www.biga.bel.tr/; https://www.gelibolu.bel.tr/; http://www.biga.gov.tr/; http://www.gelibolu.gov.tr/).

Due to these characteristics of Biga Peninsula, investigating sediment quality is crucial for both human and ecosystem health. In this research, accumulations and spatiotemporal distributions of lithium (Li), manganese (Mn), nickel (Ni) and Barium (Ba) in sediments of the riverine habitats of Biga Peninsula were investigated.

Materials and Methods

Research area and sample collection

Five fluvial habitats were selected across the Biga Peninsula (Figure 1). Surface sediment samples were then collected during the dry (late summer) and wet (late winter) seasons of 2022–2023 using a Hydrobios branded Ekman Grab (EPA, 2001a).

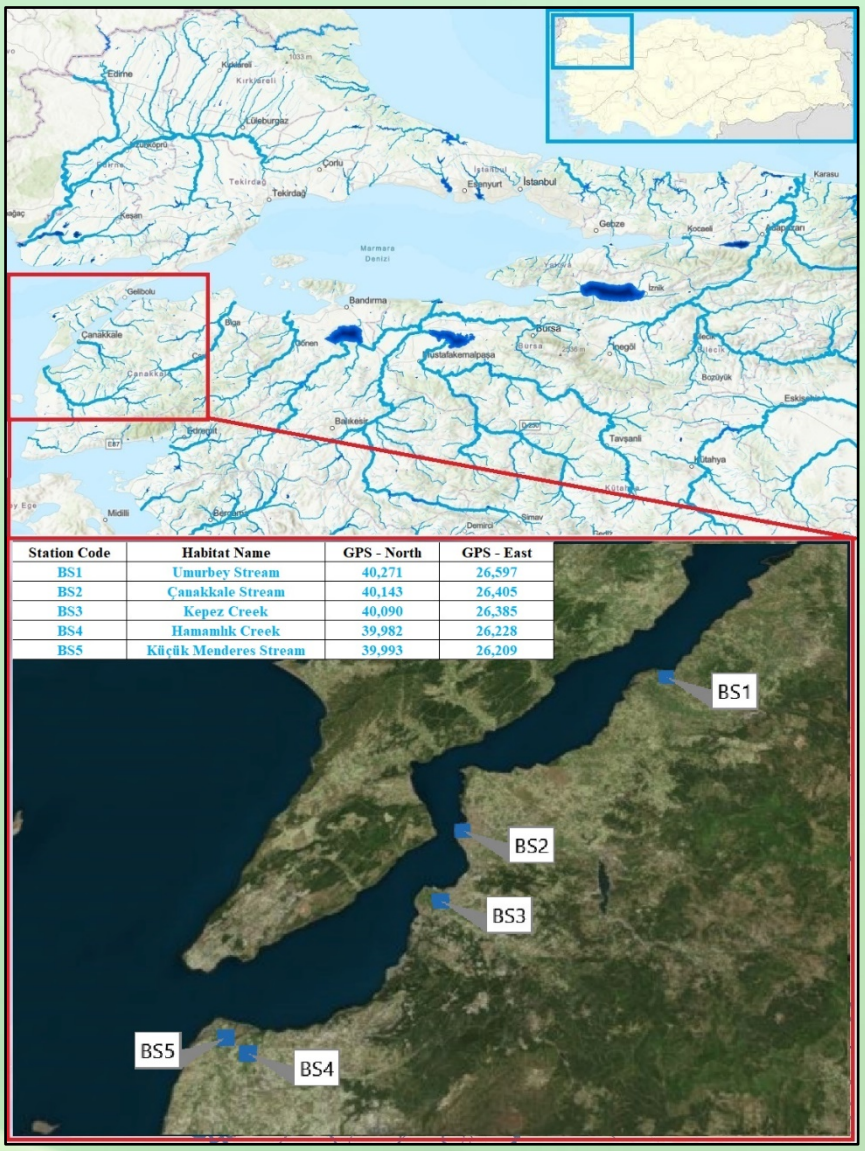

Figure 1. Research area and selected sampling stations

Macro – micro element analysis

To quantify the concentrations of lithium (Li), manganese (Mn), nickel (Ni), and barium (Ba) in the sediment samples, each sample was first dried for 3 hours at 105°C. A 0.25g aliquot of each dried sample was then placed into a CEM Mars Xpress microwave digestion system. To initiate the digestion process, a mixture of acids ($HClO_4$ and HNO_3 in a 1:3 ratio) was added to the reactors (Pyrex). The samples were subsequently subjected to mineralization by heating at 200°C for 30 minutes. After the mineralization process, the samples were filtered through a 0.45 µm cellulose nitrate filter. The filtrates were then diluted to a final volume of 100 ml with ultrapure water. The elemental concentrations in the samples were measured using an Agilent 7700 ICP-MS system, performing triple readings for each sample. The analysis was conducted at the central laboratory of Trakya University (Edirne, Turkey), which is accredited under TS EN / ISO IEC 17025 (EPA, 1998; 2001b).

Results and Discussion

The variations of measured lithium (Li), manganese (Mn), nickel (Ni) and Barium (Ba) concentrations in sediments of riverine habitats located in Biga Peninsula are given in Figure 2. Significant spatial and temporal differences in accumulations of investigated elements were recorded. Average data of the Li, Mn, Ni and Ba levels in sediments of straits basins components in dry and wet seasons as follows respectively: 2 – 14 mg/kg for Li; 1389 – 2357 mg/kg for Mn; 13 – 18 mg/kg for Ni; and 85 –151 mg/kg for Ba. Also, according to the results of this research, the annually average concentrations of investigated elements were found in the order of Mn (1076 mg/kg) > Ba (93 mg/kg) > Ni (21 mg/kg) > Li (14 mg/kg).

The geological characteristics of watersheds can significantly influence the sediment chemistry of aquatic ecosystems, potentially leading to an increase in both essential and toxic element concentrations beyond natural thresholds (Çiçek et al., 2013; 2014; Tokatlı and Helvacıoğlu, 2020; Tokatlı and İslam, 2022; Mia et al., 2023; Mutlu et al., 2023). Elevated concentrations of macro elements in aquatic environments serve as indicators of anthropogenic activities and may pose a threat to natural ecosystems (Köse et al., 2023; Tokatlı et al., 2023; Din et al., 2023). Consequently, the relatively high macro element contents detected in sediments at certain locations are likely attributable to the geological composition of the region and human-induced influences.

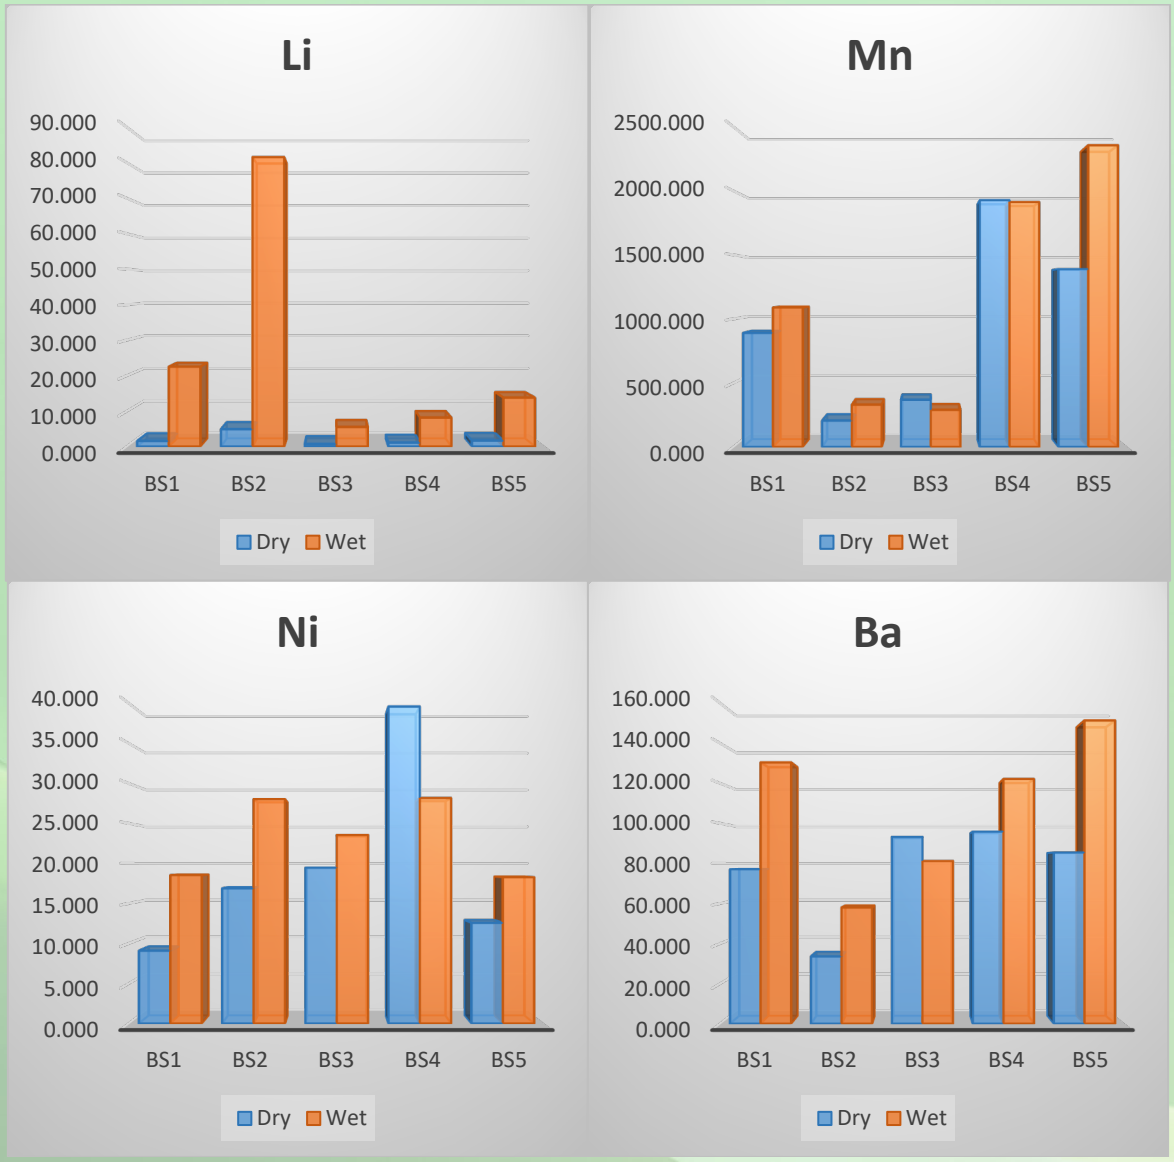

Figure 2. Detected element levels

Conclusions

The results of this study indicate significant spatial and temporal variations in the concentrations of lithium (Li), manganese (Mn), nickel (Ni), and barium (Ba) in the sediments of riverine habitats located in the Biga Peninsula. The observed differences between dry and wet seasons suggest that seasonal factors, such as rainfall and runoff, may influence the distribution and accumulation of these elements in sediments. The average concentrations of Mn, Ba, Ni, and Li were found to vary significantly, with Mn exhibiting the highest levels across both seasons. Specifically, Mn concentrations ranged from 1389 mg/kg in the dry season to 2357 mg/kg in the wet season, highlighting its dominant presence in the sediments of these riverine habitats. Conversely, lithium, with a range of 2 to 14 mg/kg, exhibited the lowest concentrations. The order of average concentrations—Mn > Ba > Ni > Li—reflects the relative abundance of these elements in the environment and emphasizes the importance of manganese in this context. These findings suggest that while some elements, such as Mn and Ba, are more prevalent in the sediment, other elements like Li and Ni may be influenced by different environmental processes or sources. Further research is needed to understand the underlying mechanisms driving these variations and to assess the potential impacts on the local ecosystem.

Çökelek Peyniri Üretiminde Farklı Starter Kültür Kullanımı

Gökçe Eminoğlu

Ankara Üniversitesi Ziraat Fakültesi, Süt Teknolojisi Bölümü

Peynir, süt ürünleri içerisinde en fazla çeşitliliğe sahip olan üründür. Ülkemizde en çok tüketilen peynir çeşitleri Beyaz ve Tulum olmakla birlikte, özellikle kırsal bölgelerde en çok tüketilen peynir çeşitlerinden biri de çökelek peyniridir. Çökelek peyniri, genellikle aile işletmelerinde geleneksel yöntemlerle üretilmekte ve Türkiyede çoğunlukla semt pazarlarında satışı yapılmaktadır. Çökelek peyniri ülkemizin farklı bölgelerinde yaygın şekilde üretilmekte ve üretildiği bölgenin özelliklerine ve üretim koşullarına bağlı olarak farklı isimlerle de adlandırılmaktadır. Çoğunlukla geleneksel olarak yoğurttan üretilen bu peynir çeşidi, süt, peyniraltı suyu, yayıkaltı ve ayrandan da üretilebilmektedir. Üretim prosesi bakımından büyük farklılık göstermeyen çökelek üretiminin temel aşaması, üretiminde kullanılan hammaddeye çeşitli pıhtılaştırıcıların eklenmesi (enzim, kültür ya da çiğ sütün doğal florası ile asitiliğin ilerletilmesi) ardından kaynatılması ve elde edilen pıhtının süzülmesi şeklindedir. Üretilen peynir çeşidinden bağımsız olarak, uygun başlangıç kültürlerinin dikkatli bir şekilde seçilmesiyle peynirin dokusunu ve tadını geliştirmek, peynir endüstrisinin büyümesini ilerletmek için önemli bir yöntemdir. Laktozdan laktik asit üretmek peynir yapımındaki en önemli adımdır. Starter kültürler, ürüne istenen tadı, aromayı ve yapıyı sağlayan belirli özelliklere sahip mikroorganizmalardır. Süt endüstrisinde standart ve kaliteli ürünlerin üretimi, uygun özelliklere sahip başlangıç kültürlerinin kullanılmasına bağlıdır. Starter kültürlerin ürünün lezzetini artıran bileşikler ürettiği bilinmekle birlikte, taze peynirler genellikle benzer lezzet ve aromaya sahiptir. Bu nedenle, taze fermente ürünlerin üretiminde başlangıç kültürünün seçimi, tüketicilerin tat ve aroma algısını şekillendirmede oldukça önemlidir. Bu düşünceden yola çıkarak, bu çalışmada çökelek peyniri üretimde 3 farklı ticari starter kültür kullanılmış ve elde edilen peynir örneklerinin mikrobiyolojik, fizikokimyasal, tekstürel ve duyusal özellikleri karşılaştırmalı olarak incelenmiştir.

Anahtar kelimeler: *Çökelek peyniri, starter kültür, DVS kültür*

Determinants Of Choice Of Marketing Outlet For Edible Insects Among Smallholder Farmers And Traders In Western Kenya

Lydia Akinyi Omondi
Jaramogi Oginga Odinga University of Science & Technology, Kenya

Abstract

The edible insect sector has, in recent times, gained significant prominence and attention. Particularly, the government of Kenya has made remarkable steps to achieve a potentially large and valuable edible insect market, with a significant milestone being the passing of regulations on edible insects as a new source of proteins. However, research on the edible insect marketing environment is still indistinct. Therefore, the study sought to evaluate the determinants of the market outlets preferred or used by smallholder farmers and traders of domesticated and field-collected edible insects (including cricket, bees, winged termites, lake flies, and dung beetle) in Siaya and Vihiga counties. This cross-sectional study was done among 188 edible insects' farmers and traders. Purposive sampling identified the study area, while snowball sampling reached the study participants. Data was collected using structured questionnaires and analyzed using multinomial logit regression to assess independent-dependent variable relationships, yielding marginal effects. Study findings showed that at 95% confidence interval, the yield was significant to the three outlets used by the farmers. Gender was significant to both institution and open-air markets outlets but insignificant to selling at the farm gate. Age, education level, and experience in marketing were insignificant to all the three market outlets. Marketing training was significant to the institution and open-air markets**.** The study also showed that farmers and traders had limited choices to sell their edible insect produce, which was majorly affected by yield and age variables. In view of these findings, enhancing edible insect marketing and training through initiatives that would increase production among farmers and breaking the attitudes toward open-air marketing among male farmers is pivotal to the thriving of the novel food enterprise towards achieving food security in the region.

Spatiotemporal Dynamics of Li, Mn, Ni, and Ba Concentrations in Sediments of Lotic Habitats in the Gelibolu Peninsula, Türkiye

Cem Tokatlı

Trakya University, Evrenos Gazi Campus, Edirne / Türkiye
e-mail: cemtokatli@trakya.edu.tr

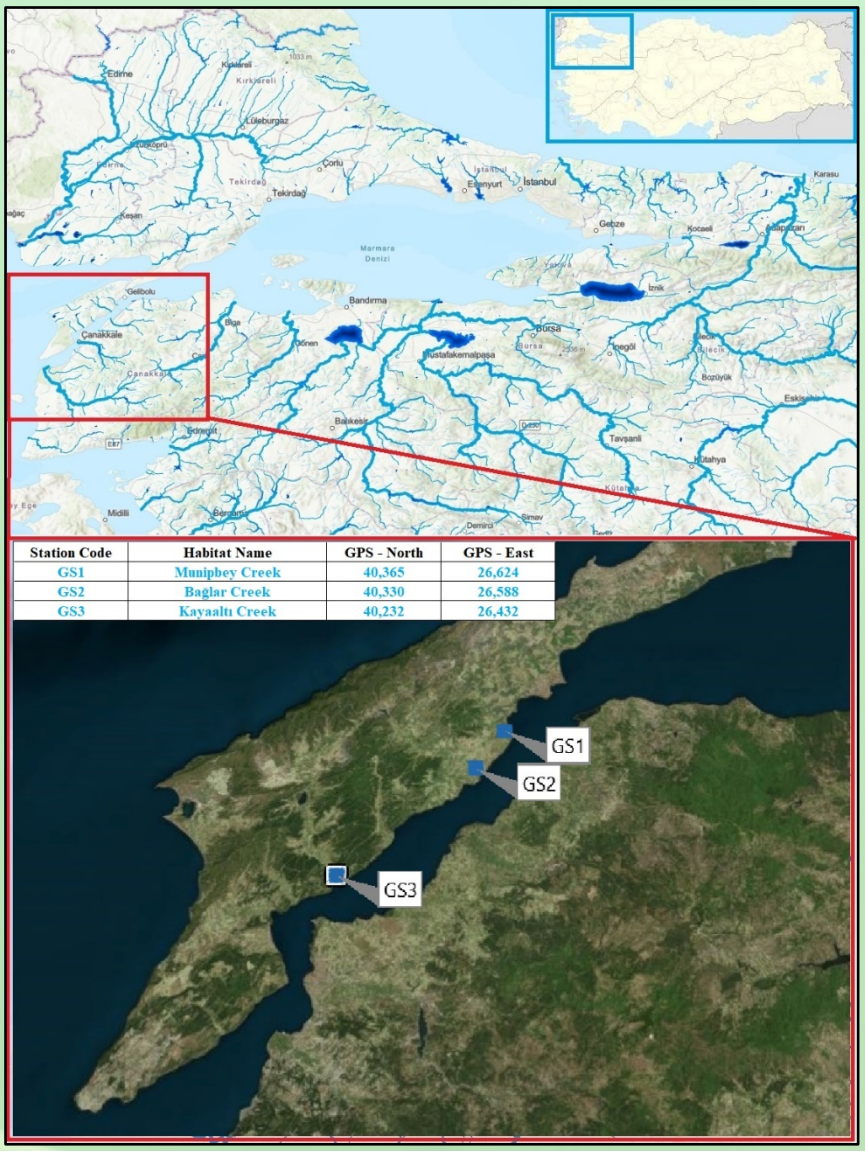
Abstract

Sediments, rich in various toxic and essential elements, play a crucial role in freshwater habitats. While some elements are necessary for living organisms, prolonged and large-scale exposure to them—similar to non-essential toxic elements—can be harmful. The Gelibolu Peninsula, situated in the northwestern part of Anatolia, holds significant agricultural, industrial, and touristic potential due to its fertile lands, strategic location, and rich natural resources. This study was carried out to determine the spatiotemporal variations of lithium (Li), manganese (Mn), nickel (Ni) and Barium (Ba) levels in sediments of the riverine ecosystems located in the Gelibolu Peninsula. Three riverine ecosystems were selected for the study, and sediment samples were collected during both the dry and wet seasons of 2022–2023 to assess seasonal variations. According to the results of this research, the annually average concentrations of investigated elements in sediments of the riverine ecosystems located in the Gelibolu Peninsula were found in the order of Mn (708 mg/kg) > Ba (52 mg/kg) > Ni (22 mg/kg) > Li (15 mg/kg). While no significant seasonal differences were detected in Mn, Ni and Ba accumulations, it was recorded that the average Li values in the sediments increased approximately 4 times during the wet season.

Keywords: *Gelibolu Peninsula, Creeks, Sediment quality*

Introduction

The presence of certain elements in the environment is essential for sustaining life, as they contribute to the growth and development of all living organisms. However, when these elements, including manganese, accumulate in excessive concentrations, they can negatively impact ecosystems, much like toxic elements such as lithium, nickel, and barium. Therefore, ensuring that toxic elements remain below critical limits and that essential elements are present in balanced amounts within aquatic habitats is crucial for environmental preservation (Haq et al., 2023; Haque et al., 2023; Muhammad et al., 2025). Freshwater sediments act as major carriers of pollutants in aquatic ecosystems and offer valuable insights into environmental conditions (Muhammad et al., 2024; Yüksel et al., 2024; Tokatlı et al., 2025). Thus, examining the elemental composition of surface sediments is fundamental for assessing and monitoring ecological health (Varol et al., 2022; Ustaoğlu et al., 2022; Köse et al., 2023).



The Gelibolu Peninsula, located in the northwestern region of Anatolia, offers considerable agricultural, industrial, and touristic potential, owing to its strategic geographical position, fertile lands, and abundant historical and natural resources. Positioned in the southern part of East Thrace, the European region of Türkiye, with the Aegean Sea to the west and the Çanakkale Strait to the east, the peninsula benefits from a favourable climate and productive soils that support a diverse array of agricultural activities. These include the cultivation of various crops, fruits, and vegetables, which contribute substantially to both local and national economies. The region's agriculture-based economy is further strengthened by the development of numerous industrial facilities that engage in agriculture-based production. Additionally, the Gelibolu Peninsula has a well-established fishing industry, with many fish canning facilities operating in the area. The presence of developing industrial zones, along with the region's historical significance, scenic coastal landscapes, and cultural heritage, also make it a prominent tourism destination, attracting visitors interested in both historical exploration and nature-based experiences (Anonymous, 2021; Tokatlı et al., 2023; 2024; Varol and Tokatlı, 2024; https://www.biga.bel.tr/; https://www.gelibolu.bel.tr/; http://www.biga.gov.tr/; http://www.gelibolu.gov.tr/).

Due to these characteristics of Gelibolu Peninsula, investigating sediment quality is crucial for both human and ecosystem health. In this research, accumulations and spatiotemporal distributions of lithium (Li), manganese (Mn), nickel (Ni) and Barium (Ba) in sediments of the riverine habitats of Gelibolu Peninsula were investigated.

Materials and Methods

Research area and sample collection

Three fluvial habitats were selected across the Biga Peninsula (Figure 1). Surface sediment samples were then collected during the dry (late summer) and wet (late winter) seasons of 2022–2023 using a Hydrobios branded Ekman Grab (EPA, 2001a).

Station Code	Habitat Name	GPS - North	GPS - East
GS1	Munipbey Creek	40,365	26,624
GS2	Baglar Creek	40,330	26,588
GS3	Kayaaltı Creek	40,232	26,432

Figure 1. Research area and selected sampling stations

Macro – micro element analysis

To quantify the concentrations of lithium (Li), manganese (Mn), nickel (Ni), and barium (Ba) in the sediment samples, each sample was first dried for 3 hours at 105°C. A 0.25g aliquot of each dried sample was then placed into a CEM Mars Xpress microwave digestion system. To initiate the digestion process, a mixture of acids ($HClO_4$ and HNO_3 in a 1:3 ratio) was added to the reactors (Pyrex). The samples were subsequently subjected to mineralization by heating at 200°C for 30 minutes. After the mineralization process, the samples were filtered through a 0.45 µm cellulose nitrate filter. The filtrates were then diluted to a final volume of 100 ml with ultrapure water. The elemental concentrations in the samples were measured using an Agilent 7700 ICP-MS system, performing triple readings for each sample. The analysis was conducted at the central laboratory of Trakya University (Edirne, Turkey), which is accredited under TS EN / ISO IEC 17025 (EPA, 1998; 2001b).

Results and Discussion

The variations of measured lithium (Li), manganese (Mn), nickel (Ni) and Barium (Ba) concentrations in sediments of riverine habitats located in Gelibolu Peninsula are given in Figure 2. Significant spatial and temporal differences in accumulations of investigated elements were recorded. Average data of the Li, Mn, Ni and Ba levels in sediments of straits basins components in dry and wet seasons as follows respectively: 5 – 19 mg/kg for Li; 571 – 523 mg/kg for Mn; 21 – 15 mg/kg for Ni; and 23 – 26 mg/kg for Ba. Also, according to the results of this research, the annually average concentrations of investigated elements were found in the order of Mn (708 mg/kg) > Ba (52 mg/kg) > Ni (22 mg/kg) > Li (15 mg/kg).

The geological composition of watersheds plays a crucial role in shaping the sediment chemistry of aquatic ecosystems, often leading to an increase in both essential and toxic element concentrations beyond their natural baselines (Çiçek et al., 2013; 2014; Tokatlı and Helvacıoğlu, 2020; Tokatlı and İslam, 2022; Mia et al., 2023; Mutlu et al., 2023). Elevated macro element concentrations in aquatic habitats are widely recognized as indicators of anthropogenic influence and can have detrimental effects on natural ecosystems (Köse et al., 2023; Tokatlı et al., 2023; Din et al., 2023). Therefore, the relatively high macro element levels observed in sediments at specific locations are likely a consequence of both underlying geological formations and human activities within these regions.

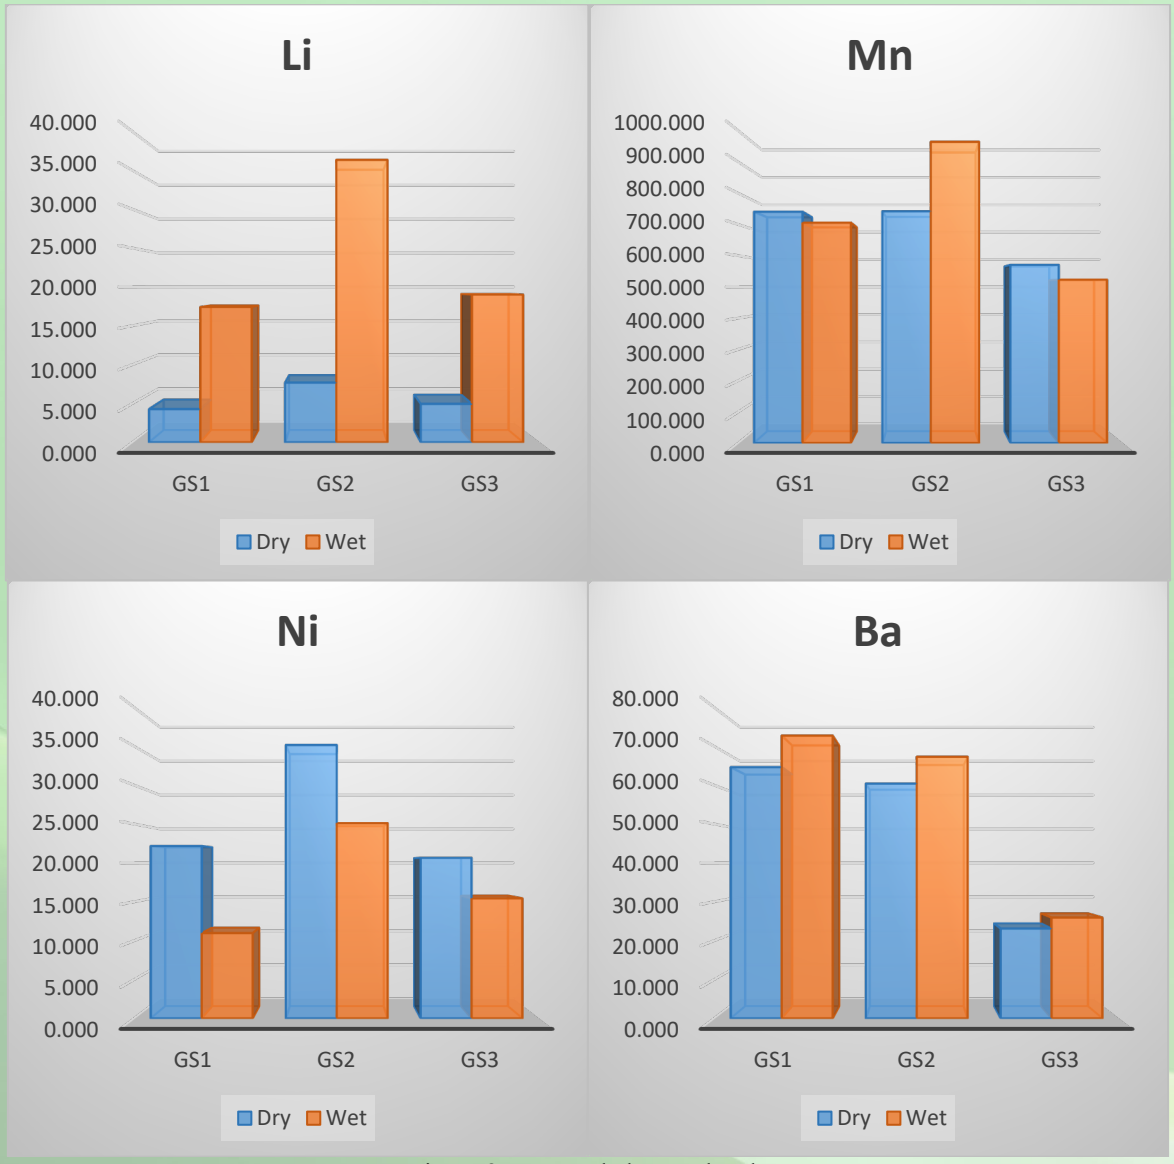


Figure 2. Detected element levels

Conclusions

The findings of this study reveal notable spatial and temporal variations in the concentrations of lithium (Li), manganese (Mn), nickel (Ni), and barium (Ba) in the sediments of riverine habitats in the Gelibolu Peninsula. These differences, observed between the dry and wet seasons, suggest that seasonal fluctuations, such as changes in rainfall, water flow, and sediment transport, significantly influence the distribution and accumulation of these elements. The concentrations of Mn, Ba, Ni, and Li were found to vary across the seasons, with manganese exhibiting the highest concentrations. Specifically, Mn levels ranged from 571 mg/kg in the dry season to 523 mg/kg in the wet season, indicating a relatively high and stable presence in the sediments throughout the year. In contrast, lithium had the lowest concentrations, ranging from 5 to 19 mg/kg. The average concentration levels for the elements in the sediments were found in the following order: Mn > Ba > Ni > Li. This pattern reflects the relative abundance of these elements in the environment and suggests that manganese plays a dominant role in the sediment chemistry of the Gelibolu Peninsula. The findings highlight the need for further research to explore the environmental factors influencing these variations and their potential implications for the local ecosystem and water quality management.

The effect of the addition of shalgam beverage residual product setik on the physical properties of tarhana

Hasan TANGÜLER[1*], Muhammet Çağrı KILIÇ[1], Ayşenur İNCE[1],

[1]Department of Food Engineering, Faculty of Engineering, 1Niğde Ömer Halisdemir University, Niğde,Turkey
* htanguler@ohu.edu.tr

Abstract

The effects of different ratios (5%, 10%, 15% and 20% residual setic powder addition) of setik (bulgur flour) on the physical properties of the product were investigated in tarhana production. In color analysis, compared to the control sample, L* (brightness) value decreased and a* (redness) value increased with the addition of setik powder. Especially 20% setik powder addition (Se-Tose4) provided the highest redness value. b* (yellowness) value decreased as the amount of setik powder increased and the Se-Toz4 sample showed the lowest value. When water holding capacity, foam holding capacity and stability values were analyzed, it was observed that the addition of setik powder increased the water holding capacity and these results were statistically significant ($P<0.05$). Different changes were observed in foam holding capacity and stability values ($P<0.05$). These findings indicate that the use of setik powder in tarhana formulations affects the physical properties of the product and determination of optimum ratios is important for product quality.

Şalgam suyu artık ürünü setik ilavesinin tarhananın fiziksel özellikleri üzerine etkisi

Özet

Tarhana üretiminde farklı oranlarda (%5, %10, %15 ve %20 artık setik tozu ilavesi) setik (bulgur unu) ikavesinin ürünün fiziksel özellikler üzerindeki etkileri incelenmiştir. Renk analizlerinde, kontrol örneği ile karşılaştırıldığında, setik tozu ilavesi ile L* (parlaklık) değeri düşerken, a* (kırmızılık) değeri artmıştır. Özellikle %20 setik tozu ilavesi (Se-Toz4) en yüksek kırmızılık değerini sağlamıştır. b* (sarılık) değeri ise setik tozu miktarı arttıkça azalmış, en düşük değeri Se-Toz4 örneği göstermiştir. Su tutma kapasitesi, köpük tutma kapasitesi ve stabilitesi değerleri incelendiğinde, setik tozu ikavesinin su tutma kapasitesini artırdığı görülmüş ve bu sonuçlar istatistiksel olarak önemli bulunmuştur ($P<0.05$). Köpük tutma kapasitesi ve stabilitesi değerlerinde ise farklı değişimler gözlenmiştir göstermektedir ($P<0.05$). Bu bulgular, tarhana formülasyonlarında setik tozu kullanımının ürünün fiziksel özelliklerini etkilediğini ve optimum oranların belirlenmesinin ürün kalitesi için önemli olduğunu göstermektedir.

Understanding Farmers' Stated Preference for Gold-Mined Degraded Land Restoration

Ridwan Mukaila[1*], Festus Eluwande Awoyelu[2], Ibrahic Isaac Umaru[3]

[1,2,3]Department of Agricultural Economics, Faculty of Agriculture, University of Nigeria, Nsukka, Nigeria
*Corresponding author E-mail: ridwan.mukaila@unn.edu.ng

Abstract

Gold mining activities cause environmental issues and lead to farmland reduction, which calls for the restoration of degraded land. Therefore, this study investigates the influencing factors for farmers' decision to pay for the gold-mined restoration process to have access to more fertile land and to improve the environment. Two hundred forty farmers were randomly selected for the study. The survey design follows a contingent valuation method, and logistic regression is used to analyze the data. The results show that 92.5% of the farmers are willing to pay an average premium of ₦250,313.42 for the land restoration process. Their decision to pay for the restoration process is influenced by their awareness of the negative impacts of land degradation, the size of arable land owned, membership in the cooperative association, higher education, higher income, access to credit, and being male. These findings show the importance of awareness, financial factors, and socioeconomic factors in the land restoration process. Thus, policy design should focus on them for efficient policy intervention to restore degraded land, which could be in the form of awareness creation and financial support.

Key Words: *Gold mining, land degradation, land restoration, stated preference, willingness to pay*

Natural Bee Products for Calf Feeding

Hatice Nur KILIÇ ÖZEL[1], Mustafa BOĞA[2]

[1] Department of Forestry, Ulukisla Vocational School, Nigde Ömer Halisdemir University, Nigde, Türkiye
[2] Department of Food Processing, Bor Vocational School, Nigde Omer Halisdemir University, Nigde, Türkiye

Abstract

The use of antibiotics leaving residues in animal products and its indiscriminate use has led to the ban on their use in animals. Therefore, natural feed additives that are alternatives to antibiotics have gained importance. Nowadays, the search for natural, growth-promoting, and digestion-improving feed additives continues. One of these feed additives, bee products (propolis, pollen, royal jelly, and bee venom), can have a positive effect on performance by increasing animal feed intake, body weight gain, and feed conversion efficiency. Propolis, one of the bee products, can be used in ruminant animal feeding due to its antioxidant, antibacterial, antiviral, and antifungal properties.
The aim of this review is to compile studies on the use of natural bee products, such as propolis, pollen, royal jelly, and bee venom, in calf feeding, their effects on animals, recommended dosages, and the impacts observed in animals.

Key Words: *Bee Products, Calf Feeding, Diarrhea, Growth, Development*

Buzağı Beslemede Doğal Arı Ürünleri

Özet

Antibiyotik kullanımının hayvansal ürünlere kalıntı bırakması ve bilinçsizce kullanımı hayvanlarda kullanımının yasaklanmasına sebep olmuştur. Bu nedenle antibiyotiğe alternatif olan doğal yem katkı maddeleri önem kazanmaya başlamıştır. Günümüzde de doğal, büyüme uyarıcı, sindirim sistemini iyileştirici farklı yem katkı maddeleri arayışlar devam etmektedir. Bu yem katkı maddelerinden biri olan arı ürünleri (propolis, polen, arı sütü ve arı zehiri) hayvanların yem tüketimini, canlı ağırlık artışını ve yemden yararlanma oranını artırarak performans üzerinde olumlu etkiye sebep olabilmektedir. Arı ürünlerinden biri olan propolis ruminant hayvan beslemede antioksidan, antibakteriyel, antiviral ve antifungal özelliğinden dolayı hayvan beslemede kullanılabilmektedir.
Bu derlemede buzağı beslemede propolis, polen, arı sütü ve arı zehri olarak adlandırılan doğal arı ürünlerinin kullanımı olanağı, hayvanlar üzerindeki etkileri kullanım dozları ve hayvanlardaki etkileri hakkında yapılan çalışmaların derlenmesi amaçlanmaktadır.

Anahtar Kelimeler: *Arı Ürünleri, Buzağı Besleme, Ishal, Büyüme, Gelişme*

Giriş

Antibiyotik kullanımının yasaklanmasında sonra gıda güvenliğini artırmak için, hayvan beslemede doğal ürünlere yönelim başlamıştır. Böylece özellikle buzağı beslemesinde arı ürünlerine daha fazla önem verilmiştir (Güner ve Açıkgöz, 2023). Arı ürünleri yalnızca hayvana besin desteği sağlamakla kalmayıp, bazı metabolik hastalıkların önlenmesi ve tedavisinde de destekleyici bir işlev üstlenmektedir. Özellikle apiterapi olarak adlandırılan bu yöntem, buzağılarda farklı hastalıklara karşı doğal tedavi seçenekleri sunmaktadır (Kekeçoğlu ve ark, 2023; Rahimjanova ve ark, 2022; Mert, 2023).
Arıların ürettiği doğal ürünler, insanlar ve hayvanlar için önemli sağlık ve tıbbi faydalar sunan biyolojik olarak aktif maddeler arasındadır. Bu ürünler arasında propolis, polen, arı sütü ve arı zehri bulunmaktadır. Özellikle arı ürünleri, zengin besin bileşenleri ve sağlık için yararlı etkileri ile dikkat çekmektedir. Bu ürünler, yalnızca insanlar için değil, hayvanların sağlığı açısından da sunmuş oldukları besin maddeleri ve sağlık yararları ile öne çıkmaktadır. Arı ürünleri, amino asitler, vitaminler, mineraller ve diğer besin ögeleri açısından zengin olduğu için buzağıların edebilmekte ve bağışıklık sistemini desteklemeye yardımcı olabilmektedir (Topal ve ark, 2018; Ndimballan ve Yücel, 2021). Bununla birlikte; arı ürünlerinin besleyici özellikleri, hayvancılıkta sürdürülebilir alternatif beslenme yöntemlerinin geliştirilmesine olanak tanıyabilmekte ve buzağıların ihtiyaç duyduğu sağlıklı büyüme için etkili birer destek sunarak, onların sağlıklı gelişim süreçlerini güçlendirebilmektedir.
Ana ve petekgözünün kapanmadan önceki 3-7 günlük dönemdeki erkek arı larvalarının besin madde içeriğinden dolayı (toplam protein ana arı larvasında %12.03, erkek arı larvasında %9.47; lipid ana arı larvasında %10.30,

erkek arı larvasında %8.38; toplam esansiyel aminoasit ana arı larvasında 701.84 mg/100 gr, erkek arı larvasında 655.86 mg/100 gr ve toplam serbest yağ asitleri ana arı larvasında 1780.67 mg/100 gr, erkek arı larvasında 1830.07 mg/100 gr) hücre yenilenmesi, sağlık problemlerin giderilmesi ve vücuda enerji vermesi yönüyle hayvan beslemede de kullanılabilmektedir (Topal ve ark, 2018).

Polen, çiçeklerden arılar tarafından toplanarak kovanlarına taşınan ve yüksek protein, vitamin, mineral ile biyoaktif bileşenler içeren bir besin kaynağıdır. Polen hem bitkiler hem de polinatörler için önemli bir biyolojik madde olup, çiçeklerin dişi organları tarafından üretilen mikroskobik erkek gamet hücreleridir. Polenin yüksek besin değeri (yüksek kaliteli protein, yağ, karbonhidrat, vitaminler, mineraller ve bazı bioaktif bileşenler) hem arıların hem de diğer polinatörlerin sağlığı açısından büyük önem taşır (Alaux ve ark, 2010; Baldin ve ark, 2024). Özellikle bağırsak florasının dengelenmesine yardımcı olan polen, buzağıların bağışıklık sistemini güçlendirmektedir.

Arı sütü, kraliçe arının ve larvaların beslenmesinde kritik bir rol oynayan, protein, yağ asitleri ve vitaminler açısından zengin bir arı ürünüdür. İçeriğinde zengin miktarda protein, yağ asitleri, vitaminler ve mineraller bulundurması, arıların sağlıklı bir şekilde gelişimini sağlamada kritik bir rol oynamaktadır (Mutlu ve ark., 2023). Arı sütü, aynı zamanda benzersiz biyolojik bileşenler içerir ve bu bileşenlerin bazıları, antibakteriyel ve immün destekleyici özelliklere sahip olup, buzağıların büyümesini hızlandırırken, sağlıklı bir bağışıklık tepkisini de teşvik etmektedir (Kekillioğlu, 2023).

Arı zehri, bal arısının (Apis mellifera) savunma mekanizması olarak ürettiği biyolojik bir madde olup, birçok önemli bileşen içermektedir. Bu bileşenler arasında melittin, fosfolipaz A2, hiyaluronidaz ve diğer peptitler yer almaktadır. Melittin, arı zehrinin ana bileşeni olup, inflamatuar süreçlerde önemli bir rol oynamaktadır. Bunun yanında, fosfolipaz A2, enzimatik aktiviteleri inhibe ederek hücresel yanıtları etkilemektedir (Seo ve Lee, 2015; Çaprazlı ve Kekeçoğlu, 2021). Arı zehrinin, çeşitli hastalıkların tedavisinde apiterapi yöntemi ile kullanılması, antienflamatuar ve ağrı kesici özellikleri ile ilgilidir (Onbaşli, 2019; El-Didamony ve ark, 2024). Antienflamatuar ve analjezik özellikleri ile arı zehri, bazı hastalıkların tedavisinde kullanılmakta, bağışıklık sistemini desteklerken aynı zamanda buzağıların yaralanmalarından veya inflamatuar durumlarından kaynaklanan rahatsızlıkların giderilmesine yardımcı olabilir. Ancak, arı zehrinin alerjik reaksiyonlara yol açabileceği göz önünde bulundurularak, dikkatli bir şekilde kullanılmalıdır.

Propolis, arıların bitkilerden topladığı reçineli bir madde olarak, kovanın dış etkenlerden korunmasında önemli bir rol oynamaktadır. Propolis flavonoidler, fenolik asitler, terpenoidler ve çeşitli vitamin ve mineralleri içeren zengin bir bileşime sahiptir. İçeriğinde yer alan flavonoidler ve fenolik asitlerden dolayı antibakteriyel, antifungal, antiviral ve antiinflamatuar özelliklere sahip olup hem arıların sağlığına hem de insan sağlığına katkıda bulunduğu bilinmektedir (Ünal ve ark., 2020; Küşümler ve Çelebi, 2021). Propolis, antibakteriyel, antifungal, antiviral ve antiinflamatuar özellikler sergileyerek hem arıların sağlığını hem de buzağıların savunma sistemini güçlendirmektedir. Propolisin buzağıların bağışıklık sistemini destekleyerek hastalıklara karşı direncini artırdığı ve genel sağlık durumunu iyileştirdiği üzerine yapılan araştırmalar, propolisin buzağı beslemedeki önemini vurgulamaktadır (Kara ve ark., 2014).

Polen

Apiterapi ve doğal beslenme bilincinin giderek yaygınlaştığı günümüzde, polen alternatif bir yem katkı maddesi olarak değerlendirilmektedir. Polen, bal arılarının topladığı çiçek polenlerinin, nektar ve arı salgılarıyla birleştirilmesiyle meydana gelen, besin açısından zengin bir arı ürünüdür. Hayvancılıkta, özellikle buzağı beslenmesinde polen kullanımı, buzağının büyüme ve gelişimini desteklemesi açısından önemli bir seçenek olarak değerlendirilmektedir. Polen, %25-35 oranında protein, birçok vitamin, mineral ve antioksidan bileşen barındırır (Sönmez, 2023).

Polen, özellikle genç hayvanlara gıda olarak verildiğinde gelişimleri üzerinde olumlu etkiler gösterebilir. Araştırmalar, polenin yem ile birlikte verilmesinin buzağılarda hayvan performansını yükselttiğini, yemden faydalanma oranını ve canlı ağırlık artışını geliştirdiğini göstermektedir (Arslan ve ark, 2017). Buna ek olarak, polenin bağışıklık sistemini kuvvetlendirme ve metabolizmayı destekleme özellikleri, buzağıların hastalıklara karşı daha dayanıklı olmasını sağlar (Ndimballan ve Yücel, 2021). Polen gibi doğal ürünler, buzağılardaki sağlık sorunlarının önlenmesi ve tedavisinde yardımcı bir işlev görebilir (Güner ve Açıkgöz, 2023). Bal arısı ürünleri, hayvancılıkta sadece gıda olarak değil, aynı zamanda sağlık destekleyici unsurlar olarak da ele alınmaktadır. Polen, hayvanların sağlığını koruyarak ve performanslarını yükselterek önemli bir rol oynamaktadır (Kabiloğlu ve Kocabağlı, 2022).

Polenin buzağılar üzerindeki etkileri, onların genel beslenme durumu ve sağlıkları üzerinde belirgin sonuçlar doğurabilir. Çeşitli çalışmalarda, polen tüketiminin buzağıların bağışıklık sistemine olumlu katkılarda bulunduğu ve genel sağlık durumlarını iyileştirdiği gözlemlenmiştir (Obeidat ve ark., 2013; Maes ve ark., 2016). Polen, bağırsak mikroflorasını dengeleyerek sindirim sağlığını destekler; bunun sonucunda buzağıların huzursuzluk ve enfeksiyonlara karşı daha dirençli hale gelmelerine yardımcı olur (Wang ve ark., 2014; Vaudo ve ark, 2018).

Yapılan araştırmalar, polenin bağışıklık sistemini güçlendirme potansiyeline sahip olduğunu göstermektedir; bu, patojenlere karşı direnci artıran bazı antimikrobiyal bileşiklerin varlığı ile ilişkilidir (Brodschneider ve Crailsheim, 2010; Fowler ve ark, 2022). Ayrıca, polen tüketimi, buzağılarda büyüme, kilo alımı ve genel gelişim üzerinde

olumlu etkiler gösterebilmektedir (Thames ve ark, 2012; Obeidat ve ark, 2013). Özellikle polenin vitamin ve mineral içeriği, buzağıların büyüme dönemindeki gereksinimlerini karşılamalarına yardımcı olmaktadır (Shi, 2011). Bununla birlikte, polen alerjileri gibi bazı potansiyel risklerin de dikkate alınması önemlidir. Polen tüketimi, bazı bireylerde alerjik reaksiyonlara veya sindirim problemlerine yol açabilir (Motamed ve ark, 2013). Dolayısıyla, buzağılara polen takviyesi yaparken dikkatli olunmalı ve uygunsuz yan etkiler gözlemlendiğinde veteriner hekim danışılmalıdır.

Tablo 1. Buzağılarda polen kullanım dozu ve etkileri

Polen kullanım dozu	Etkileri	Kaynak
25 g/gün	Kuru madde sindirimini artırmıştır Besin madde sindirilebilirliği artmıştır	Tu ve ark., 2014
10 g polen/baş/gün	Sindirilebilirliği, beslenme değerlerini, rumen fermantasyon aktivitesini, büyüme performansını, yem dönüşümünü ve ekonomik verimliliği iyileştirmiştir	Mohsen ve ark., 2017
10 g/kg	Kan serumunda tüm immünoglobulin tiplerinin (IgG, IgM ve IgA), toplam protein, albümin, globulin, glikoz, toplam lipidler, toplam kolesterol ve toplam antioksidan kapasitesinin ve kırmızı kan hücreleri, beyaz kan hücreleri artmıştır Üre-N ve kreatinin konsantrasyonları ile AST ve ALT aktiviteleri Canlı ağırlık artmıştır	El-Nagar ve ark., 2023

Arı Sütü

Arı sütü (royal jelly), bal arıları tarafından üretilen besleyici bir maddedir ve kraliçe arıların yanı sıra arı yavrularının gelişiminde önemli bir rol üstlenir. Besin içeriği, sağlık faydaları ve olası kullanımları, birçok bilimsel araştırmada incelenmiştir. Bu araştırmalarda, arı sütü barındırdığı besleyici unsurlar ve biyolojik aktiviteleri ile öne çıkmaktadır. İlk olarak, arı sütü yüksek miktarda protein (%9-18 civarı), şeker (%7-18 civarı), yağ (%3-8 civarı) ve farklı vitaminler ile mineral bileşenler barındırmaktadır (Morita ve ark., 2012; Karimi ve ark., 2023). Bu karışım, arı sütünü besleyici bir gıda olarak vurgulamaktadır. Arı sütü, barındırdığı 10-hidroksi-2-decenoik asit gibi yağ asitleri ile proteinler sayesinde etkili bir antioksidan özellik taşımaktadır. Bu çerçevede, arı sütünün karaciğer ile böbrek sağlığını destekleyebileceği ve oksidatif stresi azaltma yeteneğine sahip olduğu kanıtlanmıştır (Karadeniz ve ark, 2011; Almeer ve ark, 2019).

Arı sütü, buzağıların beslenmesi açısından önemli olabilecek besin bileşenleri sunmaktadır. Yapılan araştırmalar, arı sütü tüketen hayvanların büyüme performanslarında gelişmeler olduğunu göstermektedir. Buzağılar için arı sütü, onların gelişim süreçleri üzerinde belirgin etkinin sağlanmasına yol açmaktadır. Arı sütü, buzağıların erken dönem beslenmelerinde yüksek kaliteli bir protein kaynağı olarak kullanılabilir; bu proteinler, hücre büyümesini ve bağışıklık sisteminin güçlenmesini destekler (Kekeçoğlu ve ark., 2023). Yapılan araştırmalar, arı sütü ve benzeri arı ürünlerinin, buzağıların sindirim sisteminin sağlıklı gelişmesine yardımcı olduğunu ve hastalıklara karşı genel direncini artırdığını göstermektedir (Mutlu ve ark., 2023). Buzağılar üzerinde yapılan çalışmalar, arı sütü takviyesi ile genç hayvanların daha hızlı büyüme oranlarına ve daha iyi bağışıklık yanıtlarına sahip olduklarını göstermektedir (Benzigül ve ark, 2021). Bunların yanı sıra, arı sütü prostaglandin üretimini engelleyen özellikler sergilemekte ve böylece inflamasyon üzerinde olumlu etkiler sağlamaktadır (Sugiyama ve ark., 2011; Kolaylı ve ark., 2016). Bu durum, arı sütünün buzağıların bağışıklık sistemine olumlu etkisini göstermektedir. Özellikle, arı sütünün mikroorganizmalara karşı etkili özellikleri ile enfeksiyon riskini azaltma potansiyelinde olduğu ve hayvan beslemede kullanılabilmektedir (Pasupuleti ve ark., 2017; Maželiėnė ve ark., 2022).

Propolis

Propolis, doğal bir bileşim olan ve arılar tarafından üretilen bir madde olarak, sağlık ile üretim açısından önemli yararlar sağladığı bilinmektedir. Bu madde, biyolojik etkileri itibarıyla buzağıların beslenmesinde önemli bir destek olarak görülmektedir. Propolisin besin içeriği ve beyaz kan hücrelerine faydalı etkisinden dolayı bağışıklık sistemine sağladığı faydalar ve genel sağlık durumunu düzeltme kapasitesi, buzağıların beslenmesinde

kullanılmasını teşvik etmektedir (Shedeed ve ark., 2019). Propolis içerisinde bulunan fenolik bileşenler ve diğer organik bileşikler, onun antioksidan ve anti-inflamatuar özellikler sergilemesine destek olmaktadır (Saad ve ark., 2021). Genç buzağıların bağırsak sağlığının korunması ve sindirim sisteminin desteklenmesi bakımından propolisin yararlı olabileceği öne sürülmektedir (Soltan ve Patra, 2020).

Küresel olarak büyükbaş hayvan işletmelerinde en önemli sorunlar arasında buzağı ishalleri yer almaktadır. Buzağı ishalleri özellikle yeni doğan 2-3 haftalık buzağılarda görülmekte ve *Escherichia coli, Salmonella, Cryptosporidium parvum, rotavirüs, koronavirüs* patojenleri ile ilişkili olabilmektedir (Naylor, 2009; Muktar ve ark., 2015). Propolis ishale sebebiyet veren *Salmonella* ve *E.coli* üzerine etkili olabileceği gibi sindirim sorunlarının azaltılmasına dolayısıyla genel beslenme verimliliğini de artırmaktadır (Sarker ve Yang, 2010; Przybyłek ve Karpiński, 2019; Manav ve Yılmaz, 2021). Propolisin sindirim sistemi üzerinde yarattığı olumlu etkiler; bağırsak florasını dengeleyerek, besin maddelerinin daha iyi emilmesine imkân tanıyacağından buzağıların genel büyüme,gelişme ve canlı ağırlık artışını olumlu yönde etkileyebilmektedir (Soltan ve Patra, 2020; Küşümler ve Çelebi, 2021; Abu-Seida, 2023).

Tablo 2. Buzağılarda propolis kullanım dozu ve etkileri

Propolis kullanım dozu	Etkileri	Kaynak
4 mL propolis ekstraktı (300 mg/mL)	Canlı ağırlık artmıştır Yemden yararlanma oranı azalmıştır Ishalli gün sayısı ve dışkı skorları olumlu etkilenmiştir	Kaliboğlu ve ark., 2023
4 mL propolis ekstraktı	Buzağı sağlığını olumlu etkiemiştir İshal insidansını azaltmıştır	Slanzon ve ark., 2019
2 cc propolis tentürü	Buzağı büyümesi olumlu etkilemiştir Ekonomik kayıplara neden olan neonatal ishalleri önlemektedir	Yücel ve ark., 2015

Arı Zehri

Arı zehri (apitoksin), bal arısı (*Apis mellifera*) tarafından üretilen karmaşık bir doğal karışımdır. Bu zehir birçok biyolojik etkin madde içerir; özellikle peptitler ve enzimler başta gelir. En yaygın bileşenlerden biri melittindir, arı zehrinin yaklaşık %40-60'ını oluşturan bu peptit, hem antimikrobiyal hem de antikanser özelliklere sahip olduğu bilinmektedir (Pascoal ve ark., 2019; Małek ve ark., 2023). Ayrıca, arı zehirinde fosfolipaz A2 gibi enzimler de bulunur; bu enzimler özellikle hücre zarını parçalama yetenekleri ile dikkat çekmektedir (Khalil ve ark., 2021; Yaacoub ve ark., 2023).

Arı zehrinin buzağı yetiştirmede kullanımı, modern hayvancılıkta doğal, sağlıklı ve etkili bir seçenek olarak dikkat çekmektedir. Arı zehri, çok sayıda biyolojik aktivite sergileyen peptit ve proteinler içeren bir bileşen olduğu için hayvan sağlığına katkıda bulunma olasılığı taşımaktadır (Onbaşlı, 2019; Altıntaş ve Bektaş, 2019). Özellikle apiterapi çerçevesinde arı ürünleri, sağlık destekleyici olarak kullanılmakta ve buzağıların gelişiminde, bağışıklık sisteminin güçlenmesinde önemli bir işlev üstlenmektedir (Onbaşlı, 2019; Altıntaş ve Bektaş, 2019). Arı zehrinin enfeksiyonlara karşı koruyucu özellikleri, bağışıklığı artırması ve antimikrobiyal etkinlikleri, buzağıların sağlığını destekleme açısından önemli bir araç olduğunu göstermektedir (Kolaylı, 2017; Eser ve Erat, 2022; Kekeçoğlu ve ark, 2023).

Bunun yanı sıra, arı zehrinin sindirim sistemine sağladığı faydalar ve besin maddelerinin emilimini artırma özelliği, buzağıların beslenme etkinliğini yükselterek daha sağlıklı ve hızlı bir gelişim süreci yaşamalarına katkıda bulunabilir (Kolaylı, 2017; Güner ve Açıkgöz, 2023). Bu çerçevede, arı zehrinin doğal bir besin katkısı olarak değerlendirilmesi, antibiyotiklerin olumsuz etkilerini azaltarak daha sürdürülebilir bir üretim yöntemi sunmaktadır (Tufan ve Evren, 2021; Güner ve Açıkgöz, 2023). Ancak unutulmamalıdır ki, arı zehrinin potansiyel alerjik etkileri ve toksisitesi nedeniyle, kullanımında dikkatli olunması gerekmektedir (Motamed ve ark., 2013; Kekeçoğlu ve ark., 2023).

Tablo 3. Buzağılarda arı zehri kullanım dozu ve etkileri

Arı zehiri kullanım dozu	Etki mekanizması	Kaynak
0,05 mg/kg, 0,1 mg/kg ve 0,2 mg/kg	Buzağı gelişimi olumlu etkilenmiştir. İshal skoru ve kan biyokimyasal profili üzerine etkilidir.	Oh ve ark., 2011

Sonuç

Günümüzde, arı ürünlerinin buzağı beslemedeki kullanımı hem sağlık hem de gelişim üzerinde önemli etkilere sahip bir strateji olarak öne çıkmaktadır. Polen, arı sütü, arı zehri ve propolis, buzağıların bağışıklık sistemlerini güçlendirme, sindirim sağlığını destekleme ve genel gelişim süreçlerini iyileştirme açısından besin madde bakımından zengin içerikler sunmaktadır. Bu doğal ürünlerin entegre bir şekilde kullanılması, buzağı beslemede doğru beslenme uygulamaları ve sürdürülebilir hayvancılığın geliştirilmesi için önemli bir fırsat olabilmektedir. Gelecek araştırmalar, arı ürünlerinin buzağı sağlığına olan katkılarını daha derinlemesine inceleyerek, fiyat fayda analizlerinin yapılarak ekonomik fayda analizleri değerlendirilmesi gerekmektedir. Yapılacak yeni çalışmalarla da bu alandaki bilgi birikimine önemli katkılarda bulunabilmekte ve hayvan besleme alanında yeni stratejilerin geliştirilmesine olanak tanıyabilecektir.

Seasonal and sexual variation in the length–weight relationship of narrow–clawed (*Pontastacus leptodactylus* Eschscholtz, 1823) crayfish in Eğirdir Lake

Mehmet Cilbiz[1], Tuncay Ateşşahin[2*]

[1]Iparta University of Applied Sciences, Faculty of Eğirdir Fisheries, Isparta, Türkiye
[2]Firat University, Fisheries Faculty, Elazığ, Türkiye
* tatessahin@firat.edu.tr

Abstract

The length–weight relationship (*LWR*) is a fundamental aspect of fish biology and fisheries science, providing critical insights into various biological and ecological evolutions, such as growth analysis, stock assessment, health and condition, feeding habits etc… Therefore, accurately determining it is extremely important. The study was conducted in Lake Eğirdir in 2015 to determine the length-weight relationship of Turkey's most important crayfish stock. Seasonal sampling was performed using 200 fyke nets with different mesh sizes. The *LWR* was determined according to Le Cren (1951), and a t-test following Pauly (1984) was used to assess whether the b value differed from 3. The data were analyzed using the R package "ggFishPlots (v 0.3.1)" (Vihtakari, 2025). In the study, 4,035 crayfish with a total length ranging from 35.12 to 155.11 mm and a total weight between 1.20 and 130.80 g were evaluated. The sample comprised 56.90% (2,295) female and 43.10% (1,738) male crayfish, with a D:E ratio of 1.32. The evaluations revealed that female crayfish exhibited negative allometric growth in spring, summer, and autumn, while displaying isometric growth in winter. Male crayfish, on the other hand, showed positive allometric growth in spring, autumn, and winter, but isometric growth in summer. As a result, it was determined that the growth characteristics of crayfish varied by sex and season. In studies utilizing LWR parameters, it is believed that sampling during only one period of the year may lead to misleading results. Therefore, monthly or seasonal sampling would provide more accurate assessments.

Abstract

Tannin exists as a group of plant polyphenolic compounds which plays a vital role in animal feeding, especially for ruminants animals that exhibit protein cohesion properties. The hydrolysable tannin (HT) and condensed tannin which are two groups of tannin based on chemical structure were identified. The hydrolysable tannin when digested in the rumen of ruminants may release toxic compounds which when consumed in large quantities expose animals to health risks, while condensed tannin (CT) is the most common form of tannins which several nutritional benefits through the protection of dietary components from too much breakdown in the rumen, therefore enhancing protein use and reduction of Nitrogen (N) excretion. The study further highlighted the effects of tannin on feed intake, palatability, nutrient absorption, bloat prevention actions of tannins, and anti-parasitic functions. The moderate level of tannin in ruminant nutrition can enhance ruminant performance and excess consumption can lead to poor feed consumption with low nutrient absorption. This shows the need for selective diet formulation when including tannins in animal diets. There is a need for researchers to seek for strategic inclusion of tannins in ruminant diets especially types and amounts to optimize ruminant health and productivity. The need for future studies to continue with more understanding of tannin activities within the rumen and ways to develop protocols for effective consumption in ruminant nutrition is paramount.

Key Words: *hydrolysable tannin, condensed tannin, ruminant nutrition,*

Introduction

Tannins are various groups of polyphenolic substances that were identified for their dynamic effects in both plants and animals. In the field of ruminant nutrition, tannins were eminent to have both advantages and drawbacks. Traditionally, tannins' ability to cling to proteins and other feed material, makes it gain the anti-nutritional defects which causes a reduction the nutrient intake as well as its accessibility by the animal (Besharati et al., 2022). Despite these drawbacks, it was discovered that, with control usage of tannins in ruminant diet a positive outcome can be seen. These positive outcomes include; better protein use and animal health, there is also improvement in methane emission as well as a sustainable ruminant animal production (Fonseca et al., 2023).

Both the positive and negative effects of tannins were investigated, among the positive effect was the ability of the tannins to reduce protein and nitrogen loses in the rumen hence rumen improvement (Fonseca et al., 2023). The negative effect were associated with high tannin concentration leading to lower intake and poor digestibility, this make it necessary to be careful in deciding which dose to be given to the animal (Besharati et al., 2022; Price et al, 1980). There are a lot of loopholes on knowing how these tannins from different sources as hydroysable and condensed impact the ruminant animal wellbeing and their ability to enhance their production, even with the above stated results (Price et al, 1980).

Despite the tremendous contribution in this area there is still a need for a research that will clearly determine the optimal concentration of tannins to be included in the diet of ruminant animals according to the target production purposes. Also the need to understand the long term effects of tannins on animal wellbeing is eminent as well as the environment (Fonseca et al., 2023).

Therefore, the objective of these study is to carefully analyze the recent studies on the application of tannins in ruminant nutrition, with an emphasis in identifying the optimal condition of their usage to enhance production.

Hydrolysable and Condensed Tannins

Many different types of plants contain polyphenolic compounds known as tannins (TANs). They can be classified as either hydrolysable tannins or condensed tannins based on their chemical structure (Pastorelli, & Salvatori, 2021). Tannins that are hydrolyzable have a central carbohydrate, usually D-glucose. Some phenolic groups, such as gallic acid (gallotannins) or ellagic acid (ellagitannins), partially or completely esterify the hydroxyl groups of these carbohydrates. According to Mueller-Harvey (2001), plants typically contain small levels of hydrolyzable tannins.

According to Waghorn and McNabb (2003), these tannins are present in oak (Quercus spp.), Acacia, Eucalypts, and a variety of browsing and tree leaves. The dry matter (DM) content of the browse including the leaves and apices can range from 200g to 500g, and in certain species, the amount of phenolic compounds can surpass 500g per kg of DM (Lowry *et al.,* 1996). Although hydrolyzable tannins have the potential to be poisonous to animals, most ruminants are able to adapt to eating them (Waghorn and McNabb, 2003). Ruminants can tolerate these poisonous tannins because they can decrease the amount of products they excrete in their urine (Lowry *et al.,* 1996). While ruminants possess this ability, an overindulgence in this tannic diet can cause lesions in the liver and kidneys, as well as cause mortality (Waghorn and McNabb, 2003).

The poisonous substance that is responsible for the first over ingestion usually takes five to ten days to cause death. Rarely is information available on how hydrolyzable tannins are absorbed, digested, and affect metabolism and production. According to Le Bourvellec and Renarda (2012), condensed tannins (CTs) are flavanol units in oligomers or polymers that are usually joined by carbon-carbon bonds at the 4/6 or 4/8 position. These compounds are also called proanthocyanidins because they can degrade oxidatively in an acidic environment to produce anthocyanidin colours. In mild or anaerobic conditions, the polymer is stable, according to Hagerman *et al;* (1992). The amount and location of hydroxyl groups along with the spatial arrangement of atoms in molecules are dealt with by the form of comprise unit. Condensed tannin structure is influenced by the type and location of the connections between sequence monomeric units as well as the degree of polymerization (Dixon *et al.,* 2005). Polymeric units derived from flavanol monomers can take on several shapes. Positive and negative charges are possible for these units. According to Waghorn (2008), the amount of flavanol units in a chain length can vary from dimmers to over 20 flavanol units. Each polymer in temperate forages can consist of many flavan-3-ol structures. The number of flavonoid units in condensed tannins might range from two to fifty. Complex structures are found in condensed tannin polymers because of the various sites for interflaven bonds and the variability of flavonoid units to some substituents. Depending on their chemical makeup and level of polymerization, condensed tannins may or may not dissolve in aqueous organic solvents. Condensed tannin-containing plants are thought to have developed over time to enlist them as a defence strategy, shielding them from insects and grazing animals as well as harmful bacteria (Swain, 1979). These days, they are being taken out of different plants to help with animal health. Previously, acetone-water was used to extract these condensed tannins; however, this approach did not fully remove the CT (Barry *et al.,* 1999). Condensed and hydrolyzable tannins frequently coexist in the same plant (Waghorn, 2008). Hydrolyzable tannins are thought to be harmful to animal nutrition (Serrano *et al.,* 2009). They are polyesters of sugars (mostly glucose) and gallic or ellagic acids (Figure 1). Polymers containing flavan-3-ols are known as condensed tannins (Figure 2). They are also known as proanthocyanidins because they undergo oxidative cleavage, or heating in the presence of acid, to produce vibrant anthocyanidins. The flavan-3-ol subunits that make up each CT polymer can vary, but the most prevalent ones are gallocatechin, epigallocatechin, and catechin, which together create procyanidins and prodelphinidins.

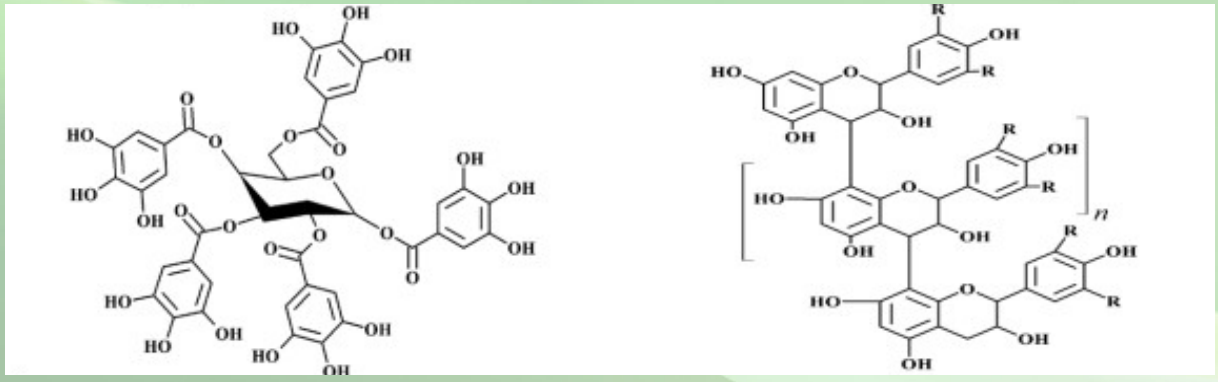

Figure 1. Structure of hydrolysable tannin (Serrano at al, 2009)

Figure 2. Structure of condensed tannin (Serrano at al, 2009)

Tannin Sources and Preference in different types of forages

According to Mueller-Harvey (2006), animal feed including Acacia, Dichrostachys, Dorycnium, Hedysarum, Leucaena, Lotus, Onobrychis, Populus, Rumex, and Salix contains tannin. According to Dixon et al. (2005), they can be found in seeds, fruits, leaves, wood, bark, and roots. The most important plant parts, such as young leaves and flowers, have higher concentrations of tannins (Terril *et al.,* 1992). According to Waghorn and McNabb (2003), the primary drivers of plant tannin synthesis are defence against diseases, energy and nitrogen conservation, and defense against grazing animals. Tannin content varies from 2 to 5% of the fresh weight. Pathological circumstances, water stress, temperature, and nutrient availability can all cause concentration to rise (Treutter, 2006).Tropical forages contain condensed tannins that are believed to stimulate plant growth by decreasing the amount of animal excrement and leaf litter released into the soil (Waghorn and McNabb, 2003). Depending on the plant type, forages containing condensed tannins offer ruminants a variety of advantages. Lotus, for instance, has been shown to be effective in preventing bloat. Other condensed tannins have demonstrated efficaciousness in enhancing live-weight growth (Waghorn *et al.,* 1999).

MECHANISM OF ACTIONS

Hydrolysable and Condensed Tannin interacts with proteins and other dietary components in the rumen

Many tannic effects on biological systems are indicated by research findings. Chemical structure determines biological properties (Patra and Saxena, 2010), and according to Waghorn and McNabb (2003), it can even have a greater influence than concentration. Large structural differences exist amongst individual tannins, which explains this. Per Patra and Saxena (2011), tannins with a lower molecular weight have higher protein reactivity. The concentration of both tannins, their molecular weight, the size, conformation, and amino acid composition of the protein, as well as the solvent, temperature, and pH of the medium in which the interactions occur, all have an impact on protein tannin complexes' properties (Le Bourvellec and Renarda, 2012). Due to their capacity to create stable hydrogen bonds between pH 3.5 and 8, they mostly affect proteins (Jerónimo *et al.,* 2016).The nature of the complexes that form between proteins and tannins in sainfoin (Onobrychis viciifolia) was investigated by Jones and Mangan (1977) using both in vitro and in vivo methods. The pH range of the rumen is between 5.7 and 7.3, and protein complexes were stable in vitro between pH 3.5 and pH 7.0. Then, as the pH changed—the abomasum pH is less than 3.5—complexes separated. Because of their detrimental effects on protein intake, digestion, and palatability, as well as on polysaccharides and minerals, tannins were long regarded as antinutritive substances. According to Crozier *et al*; (2009), frequent usage of tannin was also found to be hazardous due to damage to the kidney, liver, rumen tissue, and microvilli morphological abnormalities. According to Murdiati *et al;* (1992), the HT primarily had a negative impact on body tissue because they are enzymatically depolymerized in the rumen to gallic acid, which is then further metabolised by microbes to pyrogallol and other low molecular weight phenols that are absorbed and cause cellular damage. It is unlikely that condensed tannins may harm organs because they are not broken down and absorbed into the bloodstream. Digestion of proteins and carbohydrates is linked to a decrease in voluntary intake and their negative effects. In vitro results were validated by trials conducted on sheep that were fed sainfoin.

According to Jones and Mangan (1977), the tannin protein complexes broke apart in the duodenum but remained stable in the rumen (pH 6.5). This gave rise to the theory that tannin–protein complexes are created in the rumen and become available for gastric or pancreatic digestion when the pH drops below 3.5 (in the abomasum, pH 2.5–3) or rises above 8 (in the duodenum, pH 8). Quebracho tannins were also found by Makkar and Becker (1996) to accelerate the rate of inactivation at pH 11. The findings implied that the tannins are rendered inactive by an alkaline pH. Because of the feeding of tannin-rich feeds, the rumen's pace and extent of protein decomposition have diminished, which may have the effect of lowering ammonia concentrations and, consequently, urea N excretion in the urine(West, 1993). Particular attention has been paid to condensed tannins because, depending on the source, they may contribute significantly to the nutritional value of feed, the calibre of products acquired, and the overall health and welfare of animals when present in diets at low-to-moderate concentrations. Enhancing the digestive utilisation of feed proteins is one of the most significant benefits of CT use for ruminants. The impact of dietary tannins in ruminants may be advantageous or harmful, depending on variables like tannin chemical structure and concentration in the diet, the makeup of the basal diet, and other factors that are intrinsically related to the animals, like species and physiological stage (Piluzza *et al.,* 2014).

Biochemical pathways affected by Tannins

Nutrients in ruminants undergo fermentative digestion by rumen microbes first. Products of the microbial fermentation eventually become accessible for animal tissue metabolism as protein in the form of microbial cells and energy in the form of volatile fatty acids (Bunglavan, 2013). The ability of tannins to connect with proteins is a key characteristic that accounts for many of their biological actions (Hagerman and Butler, 1991). According to Bernays *et al*. (1989), they can be harmful to a variety of bacteria and fungi, which may be a primary factor in their evolution (Aerts *et al.,* 1999). Many leguminous fodder plants, herbs, and grasses, such as Onobtychis viclifolia (sainfoin), Lotus (L.) corniculatus (birdsfoot trefoil), L. pedunculatus (big trefoil), Hedysarum coronarium (sulla), and Lespedeza cuneata (sericea lespedeza), have intense tannin deposits in their epidermis at varying concentrations (Terrill *et al.,* 1989). Remarkably, it has been documented that plants with higher tannin concentrations yielded less leaves in comparison to those with lower tannin concentrations (Coley, 1986). Proteins in feed become quickly soluble when ruminants are fed forages with a high protein concentration. High ammonia levels result from the breakdown of proteins in the rumen by rumen bacteria. A significant amount of ammonia is taken up from the rumen and expelled in the urine (Ulyatt *et al.,* 1975). Certain tannins have the ability to decrease the quantity of protein that is broken down in the rumen and increase the quantity of protein that is accessible for digestion in the small intestine (Frutos *et al.,* 2004).Tannins and proteins combine to generate complexes. This is because phenolic groups are abundant and can form bonds with the carbonyl groups of peptides. Complexes are resistant to rumen microbe hydrolysis and deamination. More dietary amino acids are becoming available for post-ruminal absorption as a result of stable complexes. Complexes are thereafter accessible in the abomasum and undergo intestinal digestion (Bunglavan and Dutta, 2013).

IMPACT ON DIGESTION EFFICIENCY

Tannins influence on Ruminant Nutrition and Absorption

The impact of quebracho tree tannin extract on Angus steers and heifers was investigated by Beauchemin *et al*. in 2007. Research revealed that average daily gain (ADG), body weight, or nutritional intakes were unaffected by feeding with quebracho tannin extract. Moreover, it did not affect the digestion of DM, energy, or fibre (neutral and acid detergent fibre). Mezzomo *et al;* 2017 examined the effects of substituting soybean meal treated with a tannin mixture (85% CT and 15% HT) on the intake, digestibility, carcass traits, and performance of young cattle fed a diet high in concentrates. Replacing soybean meal with soybean meal treated with tannin resulted in a linear decrease in the consumption of DM. There was no discernible drop in carcass weight. A decrease in fat deposition and a rise in muscle were observed in the carcass gain composition. When tannins are used, animals' body gain composition changes and their consumption of DM decreases, improving feed conversion efficiency (Mezzomo *et al.,* 2017). When fed a high-grain diet supplemented with roughly 0.84 g tannin kg-1 body weight (BW), Frutos *et al.* (2004) showed no effect of chestnut tannin (HT) on lamb carcass qualities; there was also no effect of HT supplementation on ADG, feed efficiency, and length of finishing phase.

To feed young bulls (HT), Doce *et al.* (2007) employed oak leaves. According to the experiment's findings, giving the animals up to 5 kg of tannin per day had no discernible negative effects on ruminal fermentation or toxicity. When dairy crossbred cows were provided a 40 g HT supplement per day, Ali *et al.* (2017) discovered that the milk production increased considerably. Additionally, they saw that adding HT increased the amount of lactose (%) and milk protein. According to Dubey's (2007) findings, crossbred cows' milk output increased significantly from 9.44 to 10.35 kg/day/cow when 3% tannin from Acacia nilotica pods was added. In ewes grazing Lotus corniculatus during the early stages of lactation, Kushwaha *et al.* (2012) found no effect of CT; however, during the mid- and late-lactation stages, there was an increase in milk output of two litres. A research on Friesian dairy cows fed Lotus corniculatus was done by Woodward *et al.* (2000). When lotus was fed to cows instead of ryegrass, the increase in milk yield was noticeably higher (46%). While tannins had no influence on intake, they did enhance the concentration of milk protein, improve efficiency, and decrease the concentration of milk fat. The milk output of cows fed 88 g CT per kg DM increased by 10%, according to Anantasook *et al.* (2014). Comparing crossbred cows fed 1.5% CT per kg DM to cows not provided CT in their ration, Dey *et al.* (2014) found that the latter group's milk output decreased by 24.7%. Conversely, when cows were fed 244 g of tannins (CT) per day, Grainger *et al.* (2009) saw a drop in milk production of 29.7%. Grazing animals consume a vast range of vegetation, yet they frequently favour some while avoiding others. Taste, smell, and chemosensory irritation are the three anatomically unique chemical senses that animals use to decide which plants to consume. (Beauchamp and Mennella, 2009). Physical and chemical properties of feed define its flavour, and during consumption, post-stomach impacts of toxins and nutrients combine with flavour cues to influence palatability (Atwood *et al.,* 2001). According to a number of studies, saliva has a significant impact in how taste and texture sensations are perceived (Engelen *et al.,* 2007). The composition of saliva can affect how feed is perceived while also being influenced by the type of diet (Mese and Matsuo, 2007). A defensive mechanism of the animal against tannins has been found to be salivary proteins (Shimada, 2006).

Comparism of Tannin effects on Fiber Digestibility and Overall Feed Efficiency

Tannins in fodder affect nutritional value in both good and negative ways (Mueller Harvey and Mc Allan, 1992). High amounts of tannins impair animal performance, protein and carbohydrate digestibility, and intake (Reed *et al.,* 1990). Tannins reduce ruminal NH3-N by slowing down the rate of protein deamination and breakdown in the rumen (Woodward, 1989). When sheep and goats were fed tannin-containing legumes, there was a decrease in plasma urea nitrogen, ruminal NH3-N, and urinary N loss (Woodward, 1988). Tannins may improve the urea recycled to the rumen's efficiency. Depending on the chemical structure and concentration of meals, the makeup of the base feed, and other aspects that are inherently related to the animals, including the species and physiological stage, tannins are thought to have both negative and positive effects (Piluzza *et al.,* 2014). Reduced feed intake, nitrogen and fibre digestibility, and animal performance are examples of adverse impacts (Waghorn, 2008). On the other hand, tannins have been shown to reduce the risk of bloat, increase the digestion of protein, suppress internal parasites, and promote milk production and growth performance (Piluzza *et al.,* 2014). Additionally, it is well known that tannins contain antioxidant activity. According to certain research, eating tannins may enhance an animal's antioxidant status (López-Andrés *et al.,* 2013).Studies have indicated that adding plants or plant extracts rich in tannins to ruminant diets increases levels of health-beneficial FA in meat and milk and improves the oxidative stability of meat; however, the potential negative effects of tannins on animal performance and organoleptic properties of products pose a significant barrier to the widespread use of this nutritional strategy. In recent years, there has been a growing interest in using plants and plant extracts rich in tannins for use in nutritional strategies for improving some aspects of the quality of products from ruminants, specifically fatty acids (FA) composition and oxidative stability. Given that an animal's physiological state influences its nutritional requirements, it appears that one of the elements influencing ruminants' reactions to diets containing CT is the animal's physiological status (Waghorn, 2008).

Many experiments have been carried out on animals with higher protein requirements, such as lambs (Ramírez-Restrepo *et al.,* 2005) or lactating ewes and cows (Woodward *et al.,* 2004). These animals can respond to an increase in dietary protein and can therefore perform better in response to an excess of amino acids (Barry and Manley, 1984).The productive response to CT-containing forages is primarily beneficial, with potential improvements in daily gain of 8–38% and milk output of 10–21% as compared to controls (Waghorn, 2008). Increased availability of amino acids, especially branched-chain amino acids, methionine, and lysine, may stimulate the synthesis of milk protein and lactose (via neoglucogenesis) in relation to milk production, thereby augmenting total production (Wang *et al.,* 1996). However, the quantity eaten as well as the general quality of the meal will also have an impact on the performance of the animal. Greater availability of amino acid absorption may result from an intake of less than 50 g CT/kg DM (Min *et al.,* 2003). When combined with a medium-poor quality diet, the consumption of CT from browse has a negative impact on performance (Waghorn, 2008). Bloat is a digestive disease that affects ruminants who graze on legumes that are highly digested fodder, such clove or lucerne. When soluble protein-rich legumes are digested, stable foam may form, which restricts the amount of gas released during eructation during fermentation. The accumulation of gas causes the rumen to expand or stretch. Legumes containing CT, such as Astragalus cicer L., Lotus corniculatus, Coronilla varia, and Onobrychis vicciifolia, have been shown to reduce bloat in ruminants whether fed alone or in combination with forages that cause it (Wang *et al.,* 2012).

METHANE EMISSION

Roles of Tannins in Reducing Methane Production in Ruminants

During the process of reducing enteric methane (CH4) emissions from ruminants, tannins are thought to be a potential class of chemicals. Methane generation in rumen poses both an environmental and financial challenge. Methane is widely recognised as a powerful greenhouse gas, and 28% of all anthropogenic methane is produced by ruminants (Beauchemin *et al.,* 2008). Additionally, according to Lopez and Newbol (2007), the CH4 generated during ruminal fermentation represents a 5-8% loss in gross energy intake. A greenhouse gas known to cause large energy losses in ruminants, enteric methane is projected to contribute 2,079 and 2,344 Mt CO2-eq/year globally in 2010 and 2020, respectively (Hristov *et al.,* 2013). Methanogenic archaea and symbiotic protozoan partnerships create enteric methane during feed fermentation as a means of disposing of metabolic hydrogen (Leng, 2008). Decrease of methane developing a plan that reduces the activity and proliferation of the microbiota that produces methane without impairing rumen function is essential. As per the Bhatta *et al;* (2009) report, tannins are being explored more and more as a potential strategy to lower methane emissions from ruminants. This is because they are thought to be chemicals that show promise in reducing rumen methanogenesis. One of the most important nutritional objectives for ruminants is to reduce methane (CH4) emissions (Ramaiyulis *et al;* 2022). Animal breeding, feed modification, and rumen manipulation are the three categories of methane emission reduction strategies (Arndt et al., 2021). Concentrate and tannin supplementation reduced CH4 Yield (g/kg DMI) by 13.7–17.4% and CH4/Gain by 20.1%, according to a meta-analysis (Congio *et al.,* 2021).

EFFECTS OF TANNIN ON RUMINANTS ANIMAL HEALTH AND WELFARE

The benefits of tannins in terms of lowering intestinal parasites are also linked to their significance in animal diets. Traditionally, anthelmintic medication has been used to control ruminant gastrointestinal parasites. Unfortunately, as a result of growing parasite resistance to popular anthelmintics and the detrimental effects of chemical treatments used in animal agriculture on the environment, animal welfare, and feed safety, this process is getting harder to carry out (Min and Hart, 2003). A direct effect of tannins on nematodes has been demonstrated by feeding studies (Butter *et al.,* 2000), wherein they inhibit eggs and infective larvae and reduce larvae mobility. An indirect effect is also demonstrated by tannins, as they increase protein availability, which fortifies the immune system and increases resistance to infections (Min and Hart, 2003). Using feeds high in tannin has been suggested as an alternative to conventional parasite control methods (Nguyen *et al.,* 2005). This approach has been researched. Due to their impact on internal nematodes in ruminants, plants high in tannin have garnered the greatest interest. It has been utilised to prevent a variety of intestinal parasites in ruminants by using external tannins from plants including mimosa (HT), chestnut (HT), and quebracho (CT) (Min and Hart 2004). One of the suggested substitutes for conventional parasite control methods that has been researched is the use of diets high in tannin (Nguyen *et al.,* 2005). The effect of tannin-rich plants on internal nematodes in ruminants has garnered the greatest attention. Mimosa (HT), chestnut (HT), and quebracho (CT) are examples of external tannins that have been utilised to suppress a variety of intestinal parasites in ruminants (Min and Hart, 2003). According to a summary of in vivo research conducted by Hoste *et al;* (2006), tannins from chicory, sainfoin, sulla, Lotus pedunculatus, Sericea lespedeza, and Acacia nilotica significantly acted as anthelmintics in the digestive tracts of sheep, goats, and deer. Furthermore, Hedychium coronarium, Lotus pedunculatus, Lotus corniculatus, and Onobrychis viciifolia CTs were shown to exhibit anthelmintic-like activity against deer lungworm and gastrointestinal larvae, indicating that these forages may offer an alternate method of managing internal parasites in deer (Molan *et al.,* 2000).

PRACTICAL APPLICATION OF TANNINS

With an estimated 1076.3 kilotons of tannin needed in 2015 and a compound annual growth rate (CAGR) of 5.8% from 2016 to 2025, the global tannin market is growing quite quickly. Specifically, the wood, wine, leather, and pharmaceutical industries were in high demand. Only the leather industries utilise 62.3% of the roughly 282.4 kilotons of tannins that were generated in the USA. Tannings and goods containing tannins are also seeing growth in Europe. The reason for this is that 38% of Europe's revenue is generated by the large-scale wine industry. As a result, the tannin-related industries could have a $3.3 billion global market by 2025. Condensed tannin applications are predicted to reach 424.8 kilotons by 2025, up from 242.9 kilotons in 2015 (Grandview, 2017). However, there are a number of unanswered questions regarding tannin applications, including antinutrient effect, resistance to enzymatic hydrolysis, and incomplete knowledge about interactions with other biomolecules and animal and human modes of action. For both established and developing sectors, tannins may be the ideal natural raw material. Tannin's distinct chemical structure, natural qualities, and commercial qualities are responsible for this (Luckeneder, *et al;* 2016). Tannins have many benefits, including being an effective medicinal, biopesticide, antioxidant, biomaterial, and nutraceutical agent. There have been efforts made to create packing materials from biological sources, such as chitosan, starch, gelatin, tannins, and methylcellulose, and the idea of natural and active packaging has been developed (Kamari and Phillip, 2018). The best choice is active packaging, which not only shields the feed item from oxidation, UV rays, and moisture-based degradation but also serves as an addition to boost the antioxidant qualities of feed and absorb undesirable things like heavy metals or used oils. Packaging films based on chitin now have far better antioxidant and antibacterial qualities because to the addition of tannins. Chitin and tannins form hydrogen and hydrophobic bonds, which is primarily responsible for the improved quality of chitin-based films (Wang *et al.,* 2016). Animal skin is typically turned into leather in the leather industry by the addition of tannins. As stated by Kaygusuz *et al;* (2018), tannins have a major role in shielding leather from deterioration caused by heat and microorganisms.

RESEARCH CHALLENGES AND FUTURE RESEARCH

Aside their biological functions, they hold significant roles in the mining, chemical, tanning, and industrial sectors. They also feed animals. However, there are a few restrictions related to tannins. The primary drawback of tannins as feed is that they bind and absorb many kinds of biomolecules in the digestive tract, including proteins, carbohydrates, and metal ions. This prevents humans and animals from getting the nutrients that some biomolecules, such proanthocyanidins, provide. According to certain studies, the digestive systems of animals contain complexes of tannins and proteins that are resistant to different kinds of proteases, rendering the proteins unfit for feeding livestock. Dietary tannins attach to proline-rich proteins, forming soluble and insoluble complexes that give rise to an astringent feeling (He *et al.,* 2015). Additionally, some studies reveal that tannins also lower the activity of intestinal bacteria, which results in less soluble fibre and organic matter being absorbed and is linked

to harm to the digestive system's mucosal lining. Most tannins utilised in the livestock industry today are either entire plants containing a wide range of secondary chemicals or crude extracts of combinations with varying molecular sizes. Combining this with the differences in the chemical structures and compositions of the compounds from various sources and growth environments would lessen the possibility that microbes would develop a resistance to the complex tannins. Though not much research has been done in this area, the scientific community, regulatory agencies, and the production industry must work together to stop microorganisms from developing resistance to tannins and other plant secondary compounds that are crucial to human health because doing so will have far-reaching effects on all of humanity.

CONCLUSION

The review concluded that tannin play several roles in ruminant nutrition through the complex connection of beneficial and non-beneficial effects. There is need to properly regulate hydrolysable tannin amount included in the ruminant diet to avoid negative impacts on animal health. The inclusion of condensed tannin on the other hand offers a number of advantages which aid protein utilization improvement and reduction of nitrogen excretion thus improving the performance of ruminant animal significantly. The balance incorporation of tannin in animal diet have positive effects which includes better feed efficiency, improved nutrient absorption, bloat prevention, and fight against parasitic infections. There is need to include a required level of tannins in animal diet for better formulation. There is need for researchers to seek for strategic inclusion of tannins to diet especially types and amount to optimize ruminant health and productivity. The need for future studies to continue with more understanding of tannin activities within the rumen and ways to develop protocols for effective consumption is ruminant nutrition is paramount.

Understanding Molecular Mechanisms: Recent Advancements in Plant Resilience to Drought and Salinity

Hafiza Malaika Choudhary[1], Syeda Areej Imran[1], Munawar Ali[1*], Muther Mansoor Qaisrani[1], Kashif Kareem[1]

Abstract

Plant stress, drought, and salt reduce agricultural output and food security worldwide. Rising cultivable land salinity is expected to reduce land availability by 30% in 25 years and maybe 50% by 2050. Therefore, plant biotechnology initiatives must prioritize drought and salinity stress tolerance in agricultural plants (to assure food security) and forest trees (which are vital to world ecology). Salt and drought stress have a large impact on plant development, photosynthesis, ionic equilibrium, and oxidative balance than each stress alone. CRISPR/Cas9, which stands for clustered regularly interspaced short palindromic repeats, is a new way to edit plant genomes correctly and quickly. The metabolic abilities of several plant growth-promoting microorganisms (PGPM) may reduce the impacts of abiotic stresses. Plant-microbe interaction impacts non-living stress factors, and PGPR (Plant Growth-Promoting Rhizobacteria) such as mycorrhizal fungi and endophytes manage these stresses to enhance agricultural productivity and minimize losses. We also discuss their role in aquaporin water absorption and transport. Drought stress mobilizes plant energy to produce defense components and osmo-protectants like proline, which damages plant development. This review aims more research into plant-microbe interactions and stress tolerance ways at the molecular level. By improving our knowledge in this domain, we can develop innovative solutions to reduce soil salinity and drought stress, ensuring food security and sustainable agriculture in changing climates.,

Recent trends developed to modify plant proteins, their effects and applications

Elif Meltem İŞÇİMEN[1]

[1]Erciyes University, Engineering Faculty, Food Engineering Department, 38039-Kayseri, Türkiye

Abstract

Plant protein sources are gaining awareness because of their nutritional enrichment, imminent scarcity of animal proteins, high sustainability, and essential role in the manufacture of functional meals and bioactive peptides. However, negative consequences include the presence of anti-nutritional substances and low digestion may make plant protein sources problematic. Additionally, as compared to animal proteins, plant proteins usually have worse functional qualities and palatability.Many methods are available and are currently being investigated to modify the negative effects of plant proteins. One of these methods is the use of Maillard reactions.In the early phases of the Maillard process, glycosylation is the structural alteration of proteins caused by the addition of polysaccharides, which results in the formation of protein-polysaccharide conjugates. It has been demonstrated that the green and effective process of glycosylation produces changed proteins with improved solubility, emulsifying, and forming capabilities. Another method that can be used is fermentation. The production of bioactive peptides derived from fermentation and their application in commercial products is of significant value. The potential effects of new technologies in plant protein sources such as co-fermentation are being widely investigated. Moreover, many non-thermal approaches have been researched to enhance plant proteins' functional properties without compromising their nutritional value or sensory appeal. The technologies involved include dynamic high-pressure microjets, pulsed electric fields, cold plasma, ultrasound, and high hydrostatic pressure. There is a need to explain in detail the effects of these technique on the functional and structural behavior of proteins and to provide new perspectives.

Balık ve Yoğurt Tüketiminin Zehirlenme Algısı Açısından Biyojen Aminler Üzerinden Değerlendirilmesi

Tuğba Gözde KENDİRLİ[1], Emre YAVUZER[1]

[1]Gıda Mühendisliği, Mühendislik Fakültesi, Niğde Ömer Halisdemir Üniversitesi, Niğde, Türkiye

Özet

Biyojen aminler, canlı organizmalarda ve gıdalarda doğal olarak bulunabilen serbest aminoasitlerin dekarboksilasyonu sonucu oluşan organik azot bazlarıdır. Gıdalarda bozulmanın bir göstergesi olarak et, balık, peynir, sebze, şarap vb. gibi protein içeriği yüksek veya fermente ürünlerde yaygın olarak bulunmaktadır. Gıdalarda bulunan türleri; histamin, tiramin, putresin, kadaverin, β-feniletilamin, agmatin, triptamin, serotonin, spermidin ve spermindir. Toksisitesi en yüksek biyojen aminler içerisinde histamin ve tiramin bulunmaktadır. Ekzojen enzimlerin aktivitesi sonucu histidin aminoasiti dekarboksile olarak histamine dönüşmektedir. Histamin, yaygın olarak balık ve balıkçılık ürünlerinde bulunmasının yanı sıra yoğurt ve peynir gibi fermente süt ürünlerinde de varlığına rastlanan bir biyojen amindir. Aminoasitlerin varlığına, dekarboksilasyondan sorumlu mikroorganizmaların gelişmesini ve aktivitesini destekleyecek koşullara (pH, sıcaklık, oksijen, su aktivitesi, NaCl konsantrasyonu, katkı maddeleri ve rekabetçi mikroorganizmalar vb.) bağlı olarak histamin birikimi meydana gelmektedir. Yüksek histamin içeriğine sahip *Scombridae* ve *Scomberesocidae* familyalarından (ton balığı, uskumru, palamut, lüfer vb.) balıkların tüketilmesi "Scombroid Zehirlenmesi olarak da bilinen "Histamin Zehirlenmesi" ile ilişkilidir. Amerikan Gıda ve İlaç Dairesi (FDA) tarafından, 100 g balık etinde en fazla 50 mg/kg histamin bulunabileceği rapor edilmiştir. Avrupa Birliği'ne üye ülkeler ve Türkiye'de ise bu miktar 100 mg/kg'dır. Uygun olmayan proses ve depolama koşulları neticesinde histamin içeriği artan ürünlerin tüketimine bağlı olarak gözlemlenen zehirlenmenin yaygın belirtileri; düşük kan basıncı, baş ağrısı, ödem ve alerjik reaksiyonlara özgü döküntüler şeklindedir. Bu çalışma, balık ve yoğurdun birlikte tüketilmesinin "zehirlenmeye" yol açtığına dair yaygın inanışı biyojen aminler açısından değerlendirerek, bu besinlerin kombinasyonunun toksik etki oluşturabilmesi için belirli konsantrasyon eşiklerinin aşılması gerektiğine dair verileri ortaya koymuştur. Elde edilen veriler, balık ve yoğurt kombinasyonunun biyojen amin düzeylerinde kayda değer bir artışa neden olmadığını, ancak belirli saklama koşulları ve bireysel tolerans farklılıklarının semptomların şiddetini etkileyebileceğini göstermektedir. Başta, histamin ve tiramin gibi biyojen aminlerin varlığının, balık ve süt ürünleri tüketimiyle ilişkili semptomların temel nedeni olabileceği ancak gıda güvenliği standartlarına uygun ürünlerin tüketilmesi durumunda riskin minimal olacağı anlaşılmaktadır.

Anahtar Kelimeler: *Histamin, balık, balık-yoğurt, biyojen amin, histamin zehirlenmesi*

[2]Department of Agricultural Engineering, University of Cape Coast, Ghana

Abstract

The use of artificial sweeteners in developing countries is increasing, however, usage for sweetening indigenous drinks such as roselle beverage (Bissap) is limited. In this study, the objective was to assess the acceptability of artificially sweetened Bissap using either sucralose or saccharin, and evaluate consumers' willingness to consume artificially sweetened Bissap. Sensory evaluation by a 44-member panel, revealed that 52.27 % of consumers preferred sucrose-Bissap compared to sucralose- (31.82 %) and saccharin-Bissap (13.63 %), with the major reason given for the preference of sucrose-Bissap attributed to the dislike of the aftertaste associated with using the artificial sweeteners. The major sensory attributes used to describe sucralose-Bissap cloudy/foamy while saccharin-Bissap was described as been bitter in taste.

Keywords: *Roselle beverage, sucralose, saccharin, sensory evaluation, consumer acceptability*

Ultrasound-assisted Enzymatic Hydrolysis of Safflower Protein Isolate

Burak GÖROĞLU[1,2], Fatma KORKMAZ[1*]

[1] Department of Food Engineering, Faculty of Engineering, Balıkesir University, Balıkesir, Turkey
[2] Department of Science and Technology, Application and Research Center, Balıkesir University, Balıkesir, Turkey

Abstract

This study evaluated the effect of ultrasound pretreatment on the physicochemical properties of safflower protein hydrolysate. Safflower protein isolate prepared using alkaline extraction and isoelectric precipitation methods, was hydrolyzed via Alcalase without and with ultrasound pretreatments at 200 W (20 kHz) for 10 and 20 min, and then the degree of hydrolysis, solubility, oil binding capacity, emulsifying and foaming properties of hydrolysates were analayzed. The degree of hydrolysis of the samples was found to be in the range of 13.83-14.08. A slight decrease in the solubility of safflower protein hydrolysate was detected from 90.85% to 87.48% with ultrasound pretreatment. On the other hand, ultrasound pretreatment increased the oil binding capacity and emulsion capacity of safflower protein hydrolysate by up to %17.96 and 18.86%, respectively. However, no stable emulsion structure was observed in ultrasound pretreated hydrolysates. Additionally, the highest foaming capacity and stability values were found in hydrolysate with ultrasound pretreatment for 20 min, which were 130.00% and 49.99%, respectively. The results of this study highlighted the potential of ultrasound pretreatment as an effective method for enhancing the physicochemical properties of safflower protein hydrolysate.

Aspir Protein İzolatının Ultrases Destekli Enzimatik Hidrolizi

Özet

Bu çalışmada, ultrases ön işleminin aspir protein hidrolizatının fizikokimyasal özellikleri üzerindeki etkisi değerlendirilmiştir. Alkali ekstraksiyon ve izoelektrik çöktürme yöntemleri kullanılarak hazırlanan aspir protein izolatı, Alcalase ile ultrases ön işlemi uygulanmadan ve 200 W (20 kHz)'da 10 ve 20 dakika boyunca ultrases ön işlemleri uygulanarak hidrolize edilmiş ve sonra hidrolizatların hidroliz dereceleri, çözünürlükleri, yağ bağlama kapasiteleri, emülsiyon ve köpürme özellikleri analiz edilmiştir. Örneklerin hidroliz derecesinin %13.83-14.08 aralığında olduğu tespit edilmiştir. Ultrases ön işlemiyle, aspir protein hidrolizatının çözünürlüğünde %90.85'ten %87.48 seviyesine kadar hafif bir azalma tespit edilmiştir. Diğer yandan, ultrason ön işlemi aspir protein hidrolizatının yağ bağlama kapasitesinde %17.96'ya kadar, emülsiyon kapasitesini ise %18.86'ya kadar artış sağlamıştır. Ancak ultrases ön işlemine tabi tutulan hidrolizatlarda stabil bir emülsiyon yapısı gözlenmemiştir. Ayrıca, 20 dakika ultrason ön işlemi uygulanan hidrolizat örneğinde en yüksek köpürme kapasitesi ve stabilite değerleri sırasıyla %130.00 ve %49.99 olarak bulunmuştur. Bu çalışmanın sonuçları, ultrases ön işleminin, aspir protein hidrolizatının fizikokimyasal özelliklerini iyileştirmede etkili bir yöntem olarak potansiyelini vurgulamıştır.

[3]Elektrik Elektronik Mühendisliği, Mühendislik Mimarlık Fakültesi, Kırşehir Ahi Evran Üniversitesi, Kırşehir, Türkiye

Özet

Bu çalışmada, farklı dondurma yöntemlerine tabi tutulmuş alabalıkların 25 °C'de maruz bırakıldıkları termal stres süresince gerçekleşen kalite değişimleri, makine öğrenmesi ve görüntü işleme teknikleri kullanılarak değerlendirilmiştir. Deneysel tasarımda taze (dondurulmamış), ev tipi dondurulmuş ve endüstriyel (glaze) dondurulmuş olmak üzere üç ayrı grup oluşturulmuştur. Her bir grup için 0–7 saatlik depolama süresince, her saat başında farklı açılardan 175 adet olmak üzere toplamda her sınıftan 1400, genel toplamda ise 4200 görüntü elde edilmiştir. Görüntü kaydı, sabit bir ışık ortamında ve mobil cihaz kullanılarak gerçekleştirilmiş, böylece veri setinde homojenlik sağlanmıştır. Görüntülerin analizinde derin öğrenme modellerinden ResNet-50 mimarisi kullanılarak öznitelik çıkarımı yapılmış, ardından bu öznitelikler destek vektör makineleri (SVM) ile sınıflandırılmıştır. Sınıflandırma performansının eğitim verisi oranıyla doğrudan ilişkili olduğu gözlemlenmiş, eğitim oranı %40'ın üzerine çıktığında üç sınıf için de %90'ın üzerinde doğruluk elde edilmiştir. Elde edilen bulgular, dondurma işlemlerine bağlı olarak meydana gelen tekstürel deformasyonlara rağmen, alabalıkların kalite değişimlerinin makine öğrenmesi yaklaşımları ile başarılı bir şekilde tespit edilebileceğini göstermektedir.

Anahtar Kelimeler: *Alabalık, Termal stres, Makine öğrenmesi, Sınıflandırma, ResNet-50*

The some quality traits of oriental mustard lines in Ankara conditions

Fatma Kayaçetin[1]

[1]Department of Field Crops, Faculty of Agriculture, Ankara University, Ankara, Türkiye

Abstract

The environmental impacts of fossil fuel use make research and development studies for sustainable alternative solutions from renewable sources important. Thuse, there is a need to determine inexhaustible, renewable and sustainable biodiesel resources for biodiesel production from fixed oils obtained from plant sources. Oriental mustard is a species that contains a significant amount of fixed oil in its seeds. This study was carried out in 2020 in Ankara, Türkiye, in order to determine and compare some quality traits of five oriental mustard purelines in autumn sowing conditions under continental climate conditions. Oriental mustard lines used in this study were get from USDA gene bank and bred by pure line selection method. Field studies were carried out according to randomized block design with four replications. According to the results, it was shown that all oriental mustard purelines were statistically significant for moisture percentage in seed, crude oil percentage in moist seed, crude oil percentage in dried seed, palmitic, stearic, oleic, linoleic, linolenic, eicosenoic and erucic acids. Erucic acid (20.01-24.41%), oleic acid (21.60-24.23%) and linoleic acid (20.11-22.24%) were determined as the main fatty acids. Fixed oil ratio of purelines varied between 27.83 and 42.10%. The results determined showed the potential of using in future breeding programs for alternative medicine, paint, food and biodiesel industry. It is thought that the crude oil content of Bjo3, Bjo4 and Bjo5 stages is quite high and can be evaluated in variety breeding studies for a more economical production in the supply of raw materials to different industries.

Key Words: *Brassica juncea, Crude oil ratio, Fatty acid component*

Introduction

The increasing energy demand due to the effects of increasing population, industrialization and urbanization has caused the negative effects of fossil fuels on the environment to increase (Nayak et al., 2019). Sustainable and renewable biodiesel raw materials are attracting attention in order to secure future energy demands. Oilseed crops, animal oils and cooking oil wastes are used as biodiesel raw materials (Gómez-Trejo-López et al., 2022; Ishak et al., 2022). Oils with high erucic acid percentage obtained from different *Brassica* species are not appropriate for people utilization because of their possible harm to human health (Poddar et al., 2022) and are considered inedible oils. Inedible oils can be used as potential low-cost sources for biodiesel production due to their high erucic acid percentage (30-40%) (Yeşilyurt et al., 2019; Kayaçetin and Khawar, 2023).

Brown mustard is an amphidiploid species that was formed in nature by crossbreeding diploid species (*B. nigra* and *B. rapa*) through different factors (Malek et al. 2012). This species has two types of seed color, brown and yellow (oriental), has a one-year vegetation period and is a multi-branched plant originating from South and East Asia (Rahman et al., 2018; Kayaçetin, 2020). It is thought that this species originally existed in East India, the Caucasus, and China, and later spread to Europe, Africa, North America, and Asia (Szőllősi, 2020).

Although they contain different compounds such as glycosides, arachidic acid, sinabine, lignoceric acid, erucic acid in their oils, and these types with high erucic acid are not suitable for direct food use, they are used for different purposes in the spice, pharmaceutical and cosmetic industries, green manure, soil remediation, biofuel raw material, beekeeping, animal feed and different industrial branches (Tonguç and Erbaş, 2012; Rahman et al., 2018; Kayaçetin, 2020; Kayaçetin and Khawar, 2023). The above-ground organs of the plant are used for medical, food, feed and industrial purposes (Divakaran and Babu, 2015; Kayaçetin, 2020; Aslan, 2023;).

Oriental mustard (*Brassicaceae* family), is among the most economically significant oilseed crops (Rahman et al., 2018). The oils extracted from this crops serve as valuable sources of edible oil, biofuel, and industrial feedstocks (Sachan et al., 2024). Moreover, they contribute significantly to global agriculture and food-energy security due to their adaptability to diverse agro-climatic conditions and high oil yields per unit area (Kayaçetin, 2023). The fixed fatty acid components such as oleic acid, erucic acid and linoleic acid determine the suitability of oil for industrial or food use (Sachan et al., 2024).

This research was carried out in 2020 in Ankara, Türkiye, in order to detect and compare some quality traits of five purelines in autumn sowing under continental climate conditions.

Turkish Science and Technology Publishing (TURSTEP)

Materials and Methods

Five oriental mustard lines obtained from the USDA gene bank and characterized by the Field Crops Central Research Institute, Ankara, Turkey were used in the study.

Field trials were carried out in Ankara in the experimental area of the Institute in the autumn growing season of 2019-2020 and 925 m above sea level, based on the randomized block design with four replications. Oriental mustard seeds were sown on September 15, 2019, in 6-row plots with 30 cm row spacing and 6 m length, with 200 plants per m^2 in autumn sowing. It was harvested on July 1, 2020 during the ripening period.

The soils where field studies are carried out have a very low amount of organic matter and are slightly alkaline, and have a clayey loam texture. When the climate data were evaluated; the average total precipitation for long years and the trial year was 391.9 mm and 269.6 mm. The max. and min. temperatures for long years and the trial year were 40.4 °C, –17.9 °C, and 35.5 °C, –12.2 °C, in the same order (Table 1).

Table 1. Monthly meteorological data of oriental mustard of vegetation period (September to August)

Climatic factors	Years/Months	Sept	Oct	Nov	Dec	Jan	Feb	Mar	Apr	May	Jun	July	Agu
Rainfall (mm)	Long years	18	27,7	31,5	44,9	40,2	35,1	39,1	42,5	51,5	34,4	14,3	12,7
	2019-20	1,2	2,2	31	51,4	31	59,4	4,2	0	26,4	59,4	3,4	0
Max. Temp. (ºC)	Long years	37,7	28,5	23,1	15,5	12,5	19	23,1	28	29,7	35	36	40,4
	2019-20	29,4	27,2	20,7	10,6	7,2	10,2	19,5	20	30,4	30,5	35,4	35,5
Min. Temp. (ºC)	Long years	-1,5	-6	-11	-14,2	-17,5	-17,9	-13,8	-8	-1,5	3,5	6,3	5,5
	2019-20	1,6	1,9	-5,8	-11,1	-10,1	-12,2	-8,6	-1,7	-1	4,4	14,5	12,2

The crude oil ratio and oil profile analyses of oriental mustard purelines were performed in 4 replications at the DB Agricultural Energy Biofuel Laboratory. The fatty acid profile of lines oil in relation to TS 4664 and EN ISO 5508 was determined by gas chromatography-GC (Kayaçetin, 2023).

Data on seed crude oil percentage and fatty acid profiles of oriental mustard purelines were analyzed using Statistical Analysis Software JMP®13.2.1 using analysis of variance (ANOVA). Differences among means were separated using LSD tests ($p<0.05$).

Results and Discussion

The oil percentage and fatty acid components of oriental mustard pure lines were investigated in this study. Statistically significant variations were determined in terms of the investigated features including moisture percentage in seed, crude oil percentage in moist seed, crude oil percentage in dried seed, palmitic, stearic, oleic, linoleic, linolenic, eicosenoic, erucic acids (Table 2).

The maximum and minimum moisture percentage in seed of 6.09% and 4.64% was detected in Bjo1 and Bjo4, respectively. The maximum crude oil percentage in moist seed (42,10%) and in dried seed (43,76%) were detected in Bjo4 whereas the minimum crude oil percentage in moist seed (27,83%) and in dried seed (29.68%) were detected in Bjo2, in the same as. While the maximum palmitic (3.13%), stearic (1.51%), oleic (24.23%), linoleic (22.24%), linolenic (12.88%), eicosenoic (14.27%), erucic (27.41%) acids were detected in Bjo4, Bjo1, Bjo2, Bjo1, Bjo3, Bjo2, and Bjo5, the minimum palmitic (2.85%), stearic (1.28%), oleic (21.60%), linoleic (20.11%), linolenic (10.35%), eicosenoic (12.01%), erucic (20.01%) acids were detected in Bjo5, Bjo2, Bjo4, Bjo3, Bjo5, Bjo5, and Bjo1, respectively. The differences among the examined traits are thought to be due to genotypes (Table 2).

Table 2. The varied examined traits of oriental mustard purelines

	Moisture percentage in seed (%)	Crude oil percentage in moist seed (%)	Crude oil percentage in dried seed (%)	Palmitic (C 16:0)	Stearic (C 18:0)	Oleic (C 18:1)	Linoleic (C 18:2)	Linolenic (C 18:3)	Eicosenoic (C 20:1)	Erucic (C 22:1)
Russian Federation pureline (Bjo1)	6,09a	29,87c	31,88d	3,11a	1,51a	23,93a	22,24a	12,53a	13,73ab	20,01c

LSD (0.05) = 2.13 (20 df)	**	**	**	**	**	**	**	**	**	**

Various research articles have reported that the fatty acid profile of oriental mustard genotypes/lines/varieties depending on the genotypes and that the fatty acid profile of this species is rich in monounsaturated fatty acids such as oleic, erucic and eicosenoic and polyunsaturated fatty acids such as linolic and linolenic. (Sharafi et al., 2015; Kayaçetin et al., 2018; Rai et al., 2018; Alpaslan, 2019; Shyam et al., 2022; Kayaçetin., 2023; Sachan et al., 2024).

For sustainable biofuel production, obtaining raw materials from plants that cannot be used in food is very important in order not to increase Türkiye's existing crude oil and oilseed deficit (Başalma et al., 2025). Although it is not possible to use the seed oil directly in food due to its high erucic acid content, the fact that oriental mustard contains rich monounsaturated fatty acids such as oleic, erucic and eicosenoic in its crude fatty acid content shows that it can be used appropriately for industrial purposes (Kayaçetin, 2023).

Acknowledgements

The author would like to thank TÜBİTAK (1505-5190038) for the financial support provided by the Field Crops Central Research Institute and DB Agricultural Energy as a project; DB Agricultural Energy for the analysis of the fixed oil content and fatty acid composition of the lines and the entire project team for their contributions.

ABSTRACT

The livelihoods of agroforestry farmers are compromised by suboptimal management practices, inputs supply constraints, and post-harvest losses. The study assesses the role of *Musa species* in enhancing the livelihoods of agroforestry farmers in Egbeda municipality, Oyo State. A Multistage sampling design was adopted to select a sample size of 95 respondents from four wards. Questionnaire survey was conducted to gather data on socio-economic characteristics, *Musa species* acquisition, availability, management, and livelihood contributions. Data were analysed with descriptive and inferential statistics. Findings revealed that most respondents were males (69.5%), aged 40-50 (30.5%), and married (54.7%). Suckers were primarily sourced from fellow farmers (64.2%). Significant proportion of respondents (77.9%). Chi square analysis revealed significant associations between farmers' age, livelihood activities, and *Musa species*' contribution to livelihood improvement. The study concludes that *Musa species* production enhances agroforestry farmers' livelihoods and recommends training in value-chain production techniques to optimize returns on investments.

Keywords: *Contribution, Musa species, Management, Livelihood enhancement, Optimal yield*

INTRODUCTION

Musa species (Bananas and plantain) occupy a critical position for boosting Nigeria's food production capacity (Akinyemi *et al*., 2010). *Musa species* ranks third among starchy staples with Nigeria's production doubling over the past 20 years. Production is predominantly carried out in Southern Nigeria where smallholder farmers traditionally integrated it into diverse cropping systems. Musa species production sector in Nigeria is characterized by a gender-based division of labour, with men dominating production, and women handling marketing. However, the sector faces challenges, including farmers' limited knowledge of best practices, inadequate extension services, and research specialization biases, which collectively contribution to the country's low yields. Notwithstanding, in recent years, plantain and banana have become increasingly important contributors to revenues of Nigeria's major producing communities. The African continent is the largest producer of *Musa species*, contributing more than 50% to worldwide production (Adeniji and Tenkouano, 2008). Nigeria is one of the largest plantain and banana producing countries in the world (FAO, 2004). West and Central Africa are the dominant producers of Musa species, accounting for 61% and 21% of global production respectively (FAO, 2006). In these regions, approximately 70 million people rely on plantains and bananas for over 25% of their carbohydrate intake, making them a primary source of food energy in the African zone (Ayanwale, 2016). Notably, Nigeria ranks among the world top plantain and banana producers (FAO, 2004). Nigeria's Southern States with forest soils, including Akwa-Ibom, Cross-River, Imo, Enugu, Rivers, Edo, Delta, Lagos, Ogun, Osun, and Oyo states, are the primary regions for Musa species' production (Akinyemi *et al*., 2010). Musa species is produced in these states, and moved through marketing channels to different parts of Nigeria. Its demand is very high with supply competing with its demand, and this has created serious competition on the crop serving the status of earning foreign exchange for Nigeria. Plantain and banana are vital crops in Nigeria serving as a staple food, raw material for various product and a significant source of revenue for many individuals and industries. As a strategic crop in food production, it provides carbohydrates for over 50 million people. Its short gestation period and perennial nature make it an ideal crop. In particular, the unripe, the ripe, and the overripe are utilized in various forms, including being peeled, dried, and processed into flour, it can also be boiled or roasted as food or made into chips while overripe are used industrially serves as a base ingredient in the manufacture of baby food products, biscuits and others products (Akinyemi *et al*., 2010). Consequently, it helps alleviate hunger and food insecurity, and also enhance smallholder farmers to earn more cash and to possess cash at hand during the sales of bananas (Tenkouano *et al*., 2019). However, the main limitation affecting the supply of Musa species is post-harvest losses among others. Bautista and Esguerra (2007) reposed that poor handling and sorting have resulted in postharvest disease and losses. Additionally, certain factors like temperature, relative humidity, atmospheric composition contribute deterioration and destruction of the shelf-life of plantains and bananas. Udosen (2016) ascertained that limited processing capacity are responsible for product wastage over time. Hence, this paper assessed contribution of *Musa species*' production to livelihood enhancement of agroforestry farmers. The objectives for the study were examining the

socio-economic profiles, identifying sources of *Musa species*, identifying *Musa species* availability for production, examining management practices, and assessing the contribution of *Musa species* production to sustainable livelihoods of respondents. Hypotheses testing include relationship between socioeconomic profiles and contribution to sustainable livelihoods of farmers, and relationship between *Musa species*' production and contribution to sustainable livelihoods of farmers.

METHODOLOGY

Study Area

The study was carried out in Egbeda Municipality. The site of study is geographically located on longitude 30˚56'54.753"E, 40˚8'58.585"E, and latitude 70˚27'23.532"N, 70˚18'34.578"N with shared boundaries of Ona Ara Municipality, Lagelu Municipality, North East Municipality respectively in Oyo State, and Irewolede Municipality in Osun State (Tomori, 2012). The municipality is occupying a land mass of 420.75 km². The study area is rainforest vegetation with a certain part being a derived savannah. The local government area comprises 11 wards which are Erunmu, Ebgeda, Owobale, Olodo 1, Olodo 2, Monatan, Olode, Alugbo, Olubadan Estate, Kasumu, and Ayede (Tomori, 2012). The population of the area consists of commercial and smallholder farmers.

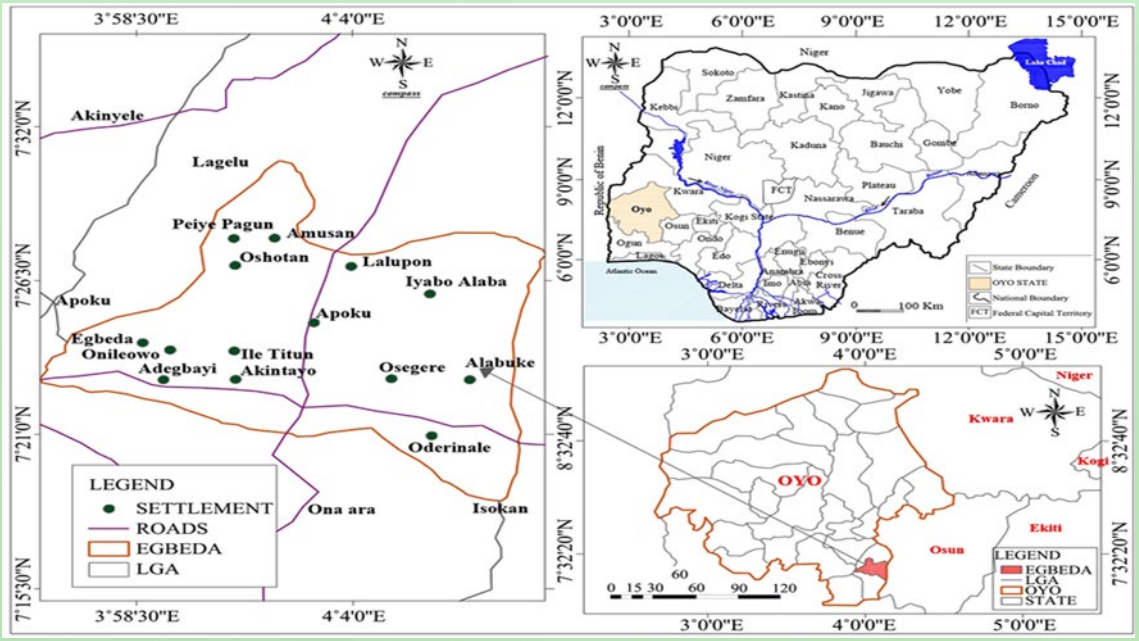

Figure 1. Maps of the Study area (Egbeda Municipality) extrapolated from the map of Nigeria

Sampling Method and Data Collection

The study adopted multistage sampling design. In 1st stage, Egbeda Municipality was purposively selected due to the large number of population of farmers practicing agroforestry. Also, in 2nd stage, 30% of 11 wards from the municipality was selected randomly. Hence, three wards were selected for the study and they were Erunmu, Egbeda, and Ayede. The sample size was selected from these three wards and communities with a random selection of 95 agroforestry farmers. Furthermore, a questionnaire was used to collect data from 95 respondents. The data collected were analyzed using frequencies, simple percentages, and inferential statistical analytical tools like chi-square and PPMC to examine the relationship that exists between the research variables.

RESULTS AND DISCUSSION

Results in Table 1 show that most respondents (69.5%) were males. This indicates male respondents engage more in the cultivation of *Musa species*. This finding corroborates submission of Ayanwale *et al*. (2018) that plantain and banana production was mainly dominated by men who were monogamously married. Majority of respondents (30.5%) that engaged in banana propagation were within age range of 41 to 50 years. This indicates that farmers who engage in production of bananas and plantains were middle-aged men. This result aligns with submission of Ayanwale *et al*. (2018) that the mean age of farmers that engaged in bananas and plantains production were in their midlife. Most respondents (54.7%) were married. This is an indication that marriage infers commitment and responsibility which influence banana production. The result negates the findings of Faturoti *et al*. (2009) who reports singles predominantly engaged in production of *Musa species*. Majority of respondents (82.1%) were having a household size of 5 persons. This indicates that family size could contributes to the robustness of bananas

and plantains production. Also, most respondents (44.2%) engaged in crop farming as one of the other livelihood activities in the study. This indicates that crop farming was another livelihood activity of the agroforestry farmers that enhances production of Musa species. This result corroborates Dimelu (2015) that most household farmers involved in mixed cropping were producers of plantain and banana in Nigeria. In addition, about 50.0% of the respondents had banana and plantain farms ranging from 1 to 2 acres. This implies that the predominant and robust production of *Musa species*. This result agrees with submission of Ayanwale *et al*. (2018) that most household farmers' farm size was less than 1 hectare. Also, 37.8% of respondents had an annual yield of 50 -60 tons of *Musa species*. This indicates that *Musa species* production is a lucrative business. This finding aligns with Nelson *et al*. (2006) who submitted that yield can be as high as 44,092 – 66.139 tons of banana and plantain annually in commercial agroforestry farms orchards. Furthermore, about 44.0% of the respondents had an annual income ranging from ₦501,010 to ₦1,500,000. This is an indication that Musa species production among agroforestry farmers contributed to their annual income. This finding aligns with the submission of Ajibade *et al*. (2022) that the net annual income from sales of *Musa species* was ₦1,907,000.

Table 1: Socio-Economic Characteristics of Respondents

Variable	Frequencies	Percentages
Gender		
Male	66	69.5
Female	29	30.5
Age		
21-30	19	20.0
31-40	25	26.3
41-50	29	30.5
>50	22	23.2
Marital status		
Single	16	16.8
Married	52	54.7
Divorced	13	13.7
Widow (er)	14	14.8
Household size		
1-5	78	82.1
6-10	13	13.7
>10	4	4.2
Other livelihood activities		
Crop farming	42	44.2
Livestock farming	23	24.2
Marketing	30	31.6

≤ 2	47	49.5
3-4	44	46.3
>5	4	4.2
Yield per annum (tons)		
≤50	30	31.6
50- 60	36	37.8
70-80	22	23.2
> 80	7	7.4
Income per annum (₦,000,000)		
<500,000	30	31.6
501,010-1,500,000	42	44.2
1,510,000-3,000,000	18	18.9
>3,000,000	5	5.3

Table 2: Sources of *Musa species* (Banana and Plantain)

Variable	Frequency	Percentage
Fellow farmers	61	64.2
Research Institutes	27	28.4
Ministry of Agriculture	4	4.2
Private horticultural farms	3	3.2

Results in Table 2 reveal that majority of the respondents (64.2%) were able to source for the suckers of *Musa species* from their fellow farmers. This result indicates that most agroforestry farmers got their planting material from their fellow farmers very close to them. This result corroborates Adeoye *et al*. (2013) who submits that about 92% of farmers sourced their planting suckers directly from their fellow farmers.

Results in Table 3 show that most respondents (60.0%) stated that *Musa accuminata* was available and 67.4% of respondents also stated *Musa balbisiana* too was available. This finding indicates that *Musa accuminata and Musa balbisiana* were predominantly available for production among farmers. This finding concurs with Adewole (2017) that *Musa species* of different varieties were predominantly available in southwest Nigeria as one of the staple foods.

Results in Table 4 show that most respondents (71.6%) agreed that seasons do not affect the production of bananas and plantain. This indicates that cultivation of *Musa species* thrives during rainy and dry seasons due to its perennial nature. This result concurs with Sense (2016) that *Musa species* need both hot and humid environments with an average temperature of 30°C and rainfall well distributed throughout the year. Furthermore, majority of the respondents (81.1%) propagated bananas with suckers sourced from their fellow farmers. This implies that banana and plantain suckers were sourced from fellow farmers which ease the stress of sourcing planting materials for robust production of banana and plantain. This result corroborates Agbongiarhuoyi *et al*. (2016) that majority of farmers sourced their planting materials from their fellow farmers. About 57.0% of respondents applied inorganic fertilizers on their farms. This indicates that applying fertilizer is important to value addition for a robust production of banana and plantain. This finding aligns with the submission by Norgrove and Hauser (2014) that majority of smallholder farmers involved in the cultivation of plantain applied fertilizer as a cultural practice. Also, most respondents (76.8%) stated that the length of maturity of bananas ranges from 9 months to more months. This indicates that the duration of banana and plantain production takes up to 9 months or more. This result conforms to the opinion of Agu (2018) that farmers need 8-9 months to harvest fully mature fruits of plantain and banana.

Results in Table 5 show that about 63.0% of respondents signified more sources of income from the production of bananas and plantain, and about 78.0% of respondents established that there was increase in their income from banana and plantain sales after harvest. Furthermore, the majority of the respondents (92.6%) had improved living standards. This indicated that banana and plantain production was a lucrative business among the agroforestry farmers which was evident in its contribution to their livelihood enhancement in the study area. This result corroborates Akinyemi *et al*. (2010) that the production of *Musa species* production has tremendously raised the income of rural livelihoods.

Table **3: *Musa species* Available for Production among Agroforestry Farmers**

Variable	Yes	No
	Frequency (%)	Frequency (%)
Musa accuminata (Wild Banana)	57 (60.0)	38 (40.0)
Musa balbisiana (Plantain)	64 (67.4)	31 (32.6)
Musa baradisiaca (Hybrid Banana)	28 (29.5)	67(70.5)

Percentages in parentheses

Table 4: Production Practices in Cultivation of *Musa Species* by Agroforestry Farmers

Variable	Yes	No
	Frequency (%)	Frequency (%)
Seasons do not affect the production of *Musa species*	68(71.6)	27(28.4)
Use of suckers from tissue culture for propagation	22(23.2)	73(76.8)
Use of suckers from fellow farmers for planting	77(81.1)	18(18.9)
Spacing of suckers during planting is essential	65(68.4)	30(31.6)
The application of inorganic fertilizer is very important	54(56.8)	41(43.2)
Use of agrochemicals important for production	17(17.9)	78(82.1)
Length of maturity between 9 months and 11 months	73(76.8)	22(23.2)
Some species mature in 12 months or more	28(29.5)	67(70.5)

Percentages in parentheses

Table 5: Contribution of *Musa Species* Production to Sustainable Livelihoods of Agroforestry Farmers

Variable	Yes	No
	Frequency (%)	Frequency (%)
Increase in sources of income	60(63.2)	35(36.8)
Improvement of income after sales	74(77.9)	21(22.1)
Improvement in standard of living	88(92.6)	7(7.4)
Contribution to food security	49(51.6)	46(48.4)

Percentage in parentheses

Table 6: Relationship between respondents' socio-economic characteristics and contribution of *Musa species* production to sustainable livelihoods of agroforestry farmers

Variable	χ^2	p-value	Decision
Sex	2.85	0.09	Not significant
Age	8.78	0.03	Significant
Marital status	6.48	0.09	Not significant
Household size	2.17	0.34	Not significant
Other livelihood activities	13.30	$1x10^{-3}$	Significant

Note: χ^2 = Chi-square coefficient, p = level of significant @ $\alpha_{0.05}$

Table 7: Relationship between the production of banana species and contribution of *Musa species* production to sustainable livelihoods of agroforestry farmers

Variable	r-value	p-value	Decision
Musa production and Sustainable livelihoods	-0.026	0.04	Significant

Note: r = correlation coefficient, p = level of significance @ $\alpha_{0.05}$

The results in Table 6 reveal that age (χ^2= 8.78, p<0.05), and livelihood activities (χ^2= 13.30, p<0.05) of the respondents are significantly related to the contribution of *Musa species* production to sustainable livelihoods of agroforestry farmers. This result implies that the age of farmers and their other livelihood activities have a high level of dependency on the contribution of *Musa species* production to the farmers' livelihood enhancement. This indicated that the farmers' age and other livelihood activities were germane factors of years of experience and practice *Musa species* production that contributed to the livelihood enhancement of the agroforestry farmers. This result corroborates Kainga *et al*. (2014) that the average age of *Musa species* farmers was approximately 45 years and their other livelihoods mean to contribute to livelihood improvement.

The result in Table 7 showcased a weak correlation but significant relationship between the production of banana species and contribution of *Musa species* production to sustainable livelihoods of agroforestry farmers (r =- 0.026, p = 0.04). This result implies that respondents' production of practices had an influence on the livelihood enhancement of the farmers indicating production practices are favorable and impactful on the livelihood enhancement of the agroforestry farmers. This finding concurs with submission of Sengar *et al*. (2019) that the management practices involved in the production *of Musa species* raise the yield of banana and plantain thereby enhancing income and sustaining the livelihoods of farmers.

CONCLUSION

The study assessed contribution of *Musa species* to sustainable livelihoods of agroforestry farmers in Egbeda municipality, Oyo State, Nigeria. The findings showed majority of the farmers engaging in *Musa species* production being middle-aged men. These were married people practicing crop farming as an additional livelihood on acres of land for production of *Musa species*. Furthermore, the findings showed that most agroforestry farmers got their planting material from their fellow farmers. The findings also revealed that *Musa accuminata and Musa balbisiana* were predominantly available for production by agroforestry farmers. Several management practices were used to ensure optimum yield for most respondents with an annual yield of 50 - 60 tons of Musa species accruing from their production with an annual income of ranging from ₦501,010 to ₦1,500,000, showcasing a lucrative business with improved income and enhanced living standards. The study recommends an introduction of effective extension services to rural agroforestry farmers by subject matter specialists to meet their information and input needs. In addition, subject matter specialists should train the agroforestry farmers on new techniques of cultivation, and also introduce them to sources of credits and loans that would create a value-chain production and high rate of return on investment.

Acknowledgments
We acknowledge the contribution of the respondents for providing us with data.

Abstract

This study aims to evaluate the antifungal effect of the essential oil of Heracleum platytaenium, an endemic plant of Turkey, against the phytopathogenic fungus *Alternaria alternata*. Fungus is a widespread fungal pathogen that causes significant economic losses in agricultural production. Due to the adverse environmental and health effects of chemical fungicides, the search for natural antifungal agents has gained increasing importance.
The antifungal activity of *H. platytaenium* essential oil obtained in different years was tested under in vitro conditions. The essential oils were applied at different concentrations (5, 10, and 20 µL) and examined for their effects on *A. alternata* mycelial growth on Potato Dextrose Agar (PDA) medium. The findings revealed that the essential oil inhibited fungal growth in a dose-dependent manner. The highest inhibition rate was observed at a 20 µL concentration, with the 2021 essential oil achieving up to 86.6% inhibition. These results suggest that the antifungal activity of the essential oil may vary depending on the extraction year.
In conclusion, the essential oil of *H. platytaenium* appears to be a promising natural antifungal agent against *A. alternata*. However, further studies are needed to explore its chemical composition, mode of action, and efficacy against different pathogens. Future research should focus on its potential use as a biofungicide in agricultural production.

Key Words:*Heracleum platytaenium, Essential oil, Antifungal activity, Alternaria alternata*

Heracleum platytaenium Boiss. Uçucu Yağının *Alternaria alternata*'ya Karşı Antifungal Aktivitesi

Özet

Çalışma, Türkiye'nin endemik bitkileri arasında yer alan olan *Heracleum platytaenium* uçucu yağının *Alternaria alternata* adlı fitopatojen fungus üzerindeki antifungal etkisini değerlendirmeyi amaçlamaktadır. *A. alternata*, tarımsal üretimde önemli ekonomik kayıplara yol açan yaygın bir fungal patojendir. Kimyasal fungisitlerin çevreye ve insan sağlığına olumsuz etkileri nedeniyle, doğal antifungal ajanların araştırılması giderek önem kazanmaktadır. Araştırmada, farklı yıllarda elde edilen *H. platytaenium* türünün meyveuçucu yağlarının antifungal etkinliği in vitro koşullarda test edilmiştir. Farklı konsantrasyonlarda (5, 10 ve 20 µL) uygulanan uçucu yağlar, Patates Dekstroz Agar (PDA) ortamında *A. alternata*'nın miselyal gelişimi üzerindeki etkileri açısından incelenmiştir. Bulgular, uçucu yağın doza bağlı olarak fungal gelişimi baskıladığını göstermiştir. En yüksek inhibisyon oranı 20 µL konsantrasyonunda gözlemlenmiş olup, 2021 yılına ait uçucu yağ %86,6'ya varan inhibisyon sağlamıştır. Bu sonuçlar, uçucu yağın antifungal aktivitesinin ekstraksiyon yılına bağlı olarak değişebileceğini ortaya koymuştur. Sonuç olarak, *H. platytaenium* uçucu yağı, *A. alternata*'ya karşı umut vadeden bir doğal antifungal ajan olarak değerlendirilebilir. Ancak, bileşen profili, etkinlik mekanizmaları ve farklı patojenlere karşı geniş kapsamlı testler ile desteklenmesi gerekmektedir. Gelecekteki araştırmalar, tarımsal üretimde biyofungisit olarak kullanımı için daha kapsamlı incelemeleri içermelidir.

Anahtar Kelimeler:*Heracleum platytaenium, Esansiyel yağ, Antifungal aktivite, Alternaria alternata*

Giriş

Bitki hastalıkları, tarımsal üretimde önemli ekonomik kayıplara neden olan başlıca faktörlerden biridir. Sentetik fungisitlerin yaygın kullanımı, çevre ve insan sağlığı üzerindeki olumsuz etkileri nedeniyle giderek daha fazla endişe yaratmaktadır (Damalas ve Eleftherohorinos, 2011). Bu bağlamda, doğal ve çevre dostu alternatifler bulmak, sürdürülebilir tarım uygulamaları için kritik öneme sahiptir. Son yıllarda, bitki kökenli bileşiklerin antifungal özellikleri üzerine yapılan araştırmalar, umut verici sonuçlar ortaya koymaktadır (Firuzi ve ark., 2010).

Heracleum cinsi, Apiaceae familyasına ait olup, dünya genelinde yaklaşık 125 türü içermektedir (Pimenov ve Leonov, 2004). Bu cinsin üyeleri, geleneksel tıpta (antioksidan) ve gıda endüstrisinde kullanımlarının yanı sıra, antimikrobiyal özellikleri nedeniyle de dikkat çekmektedir (Bahadori ve ark., 2016).
Bir çalışmada, Heracleum türlerine ait meyvelerden elde edilen uçucu yağlar GC ve GC/MS ile analiz edilmiştir. Ana bileşen oktil asetat olup, *H. platytaenium* yağında ayrıca oktil bütirat da belirlenmiştir. Uçucu yağlar *Candida glabrata*'ya karşı güçlü antikandidal etki göstermiştir (Iscan ve ark., 2004). Heracleum platytaenium, Türkiye'nin endemik türlerinden biri olarak, fitopatoloji alanında potansiyel bir kaynak olarak öne çıkmaktadır (Akcin ve ark., 2013). *H. platytaenium*'un kimyasal kompozisyonu ve biyolojik aktivitesi çeşitli araştırmaların çalışma konusu olmuştur. Kılıç ve ark. (2016), *H. platytaenium* kök uçucu yağının 70 bileşenden oluşmakta olduğunu ve ana bileşenler p-simen (%33,9), terpinolen (%14,3), γ-terpinen (%7,1), elemisin (%3,1) ve miristisin (%2,9) olarak belirlendiğini rapor etmiştir.
Bitki patojenleri, tarımsal ürünlerde önemli verim kayıplarına neden olmaktadır (Strange ve Scott, 2005). *Alternaria alternata* gibi yaygın fungal patojenler, çeşitli bitki türlerini etkileyerek ciddi ekonomik zararlara yol açmaktadır (Thomma, 2003). *H. platytaenium*'un antifungal özellikleri, bu tür patojenlere karşı doğal bir kontrol ajanı olarak kullanılma potansiyelini düşündürmektedir. Mevcut literatür, *H. platytaenium*'un fitopatolojideki potansiyel kullanımına dair umut verici işaretler sunmaktadır. Ancak, bu alanda daha fazla araştırmaya ihtiyaç vardır ve bitki patojeni funguslarla ilişkili çalışmalar eksik ve yetersizdir. Özellikle, bitkinin spesifik bitki patojenleri üzerindeki etkilerinin detaylı olarak incelenmesi, uçucu yağın aktif bileşenlerinin belirlenmesi ve in vivo koşullarda etkinliğinin değerlendirilmesi gerekmektedir (Isman, 2000; Bakkali ve ark., 2008).
Bu araştırma, *H. platytaenium*'un farklı yıllarda elde ekstrakte edilen uçucu yağların zirai üretimde ekonomik kayıplara yol açan *A. alternata*'ya karşı fitopatolojideki potansiyel kullanımını ele almayı, araştırma boşluklarını belirlemeyi ve gelecekteki çalışmalar için yön göstermeyi amaçlamaktadır. Bitkinin antifungal özelliklerinin daha iyi anlaşılması, sürdürülebilir tarım uygulamalarına katkıda bulunabilir ve yeni, çevre dostu bitki koruma stratejilerinin geliştirilmesine öncülük edebilir.

Materyal ve Yöntem

Uçucu Yağ ve Test Fungusu

Bu çalışmada kullanılan *H. platytaenium* bitkisinin uçucu yağı Isparta Uygulamalı Bilimler Üniversitesi, Ziraat Fakültesi Deneme alanlarında yetiştirilmiştir. Türün 100 gr meyveleri öğütüldükten sonra 3 saat boyunca hidrodistilasyona tabi tutulmuştur. temin edilmiştir. Araştırmada test edilen *Alternaria alterna* Bingöl Üniversitesi Ziraat Fakültesi Fitopatoloji Laboratuvarı'ndaki fungus koleksiyonundan elde edilmiştir.

Besiyeri Hazırlığı

Fungal izolatın saflaştırılması ve çoğaltılması amacıyla Patates Dekstroz Agar (PDA) besiyeri ve distile su kullanılmıştır. Hazırlanan besiyeri, 121.1°C'de 15 dakika boyunca otoklavda sterilize edildikten sonra steril petri kaplarına aktarılmıştır. Hazırlanan besiyerleri hem ön kültür elde edilmesi hem de uygulama grupları için zemin oluşturmuştur. Uygulama gruplarına uçucu yağın farklı konsantrasyonları ilave edilmiştir (5 µl, 10 µl, 20 µl) ve steril pipet ucu ile homojen bir şekilde karıştırılmıştır.

Fungal İzolatın Hazırlanması

Fungal izolatlar, hazırlanan 90 mm'lik petri kaplarındaki besiyeri üzerine yerleştirilerek optimum sıcaklık ve nem koşullarında 7 gün boyunca inkübasyona bırakılmıştır.

Antifungal Aktivite Testi

İnokülasyona hazır *A. alternata* petrilerinden 8 mm çapındaki fungal diskler steril bir fungus delici yardımıyla alınarak PDA ortamının merkezine inoküle edilmiştir. Fungusların gelişimi, petri kaplarını tamamen kaplayacak şekilde inkübasyona bırakılmıştır. Denemeler üç tekerrürlü olarak gerçekleştirilmiştir. Ayrıca, çalışmada pozitif (nistatin) ve negatif kontrol (uçucu yağ içermeyen) grupları kullanılmıştır.
İnkübasyon süresi sonunda fungal koloni çapları ölçülerek elde edilen veriler doğrultusunda solüsyonların antifungal etkinliği hesaplanmıştır (Benjilali ve ark. 1984). Hesaplama aşamasında, başlangıçta yerleştirilen 8 mm çapındaki fungal diskler değerlendirmeye dahil edilmemiştir. Solüsyonların antifungal etkisi, Deans ve Svoboda (1990) tarafından belirtilen % inhibisyon formülü kullanılarak belirlenmiştir:
İnhibisyon (%) = (gc - gt) / gc × 100(gc: kontrol gruplarındaki miselyal büyüme çapı, gt: uçucu yağ uygulanmış ortamdaki miselyal büyüme çapı).

İstatistiki Analiz

Farklı yıllar ve dozlardan elde edilen veriler tesadüf parselleri deneme deseninde 3 tekrarlı olarak faktöriyel düzenlemeye göre SAS (2009) istatistik paket programında GLM prosedürü kullanılarak standart varyans analizi tekniğinde (ANOVA) analiz edilmiş ve ortalamalar arasındaki farklılıklar LSD çoklu karşılaştırma testine göre belirlenmiştir.

Bulgular ve Tartışma

Esansiyel yağların fitopatojen funguslara karşı etkinliği, son yıllarda bitki hastalıklarının kontrolünde doğal ve çevre dostu alternatifler arayışı nedeniyle yoğun bir şekilde araştırılmaktadır (Šernaitė ve ark., 2020). Bu yağlar,

kompleks kimyasal yapıları ve çeşitli biyoaktif bileşenleri sayesinde geniş spektrumlu antifungal aktivite göstermektedir. Örneğin, dereotu (*Anethum graveolens* L.) tohum yağı, *Aspergillus flavus* üzerinde antifungal etki göstermiştir. Uçucu yağ, ergosterol sentezini inhibe ederek plazma membranında hasara neden olmuş ve hücre morfolojisini değiştirmiştir. Ayrıca, mitokondriyal membran potansiyelini (MMP) artırmış, ATPaz ve dehidrojenaz aktivitelerini azaltmış ve glikoz kaynaklı pH düşüşünü engellemiştir. Bu mitokondriyal disfonksiyon, reaktif oksijen türleri (ROS) birikimine yol açarak hücre canlılığını azaltmıştır. L-sistein eklenmesiyle ROS etkisinin önlenmesi, ROS'un antifungal mekanizmadaki önemli rolünü doğrulamaktadır (Tian ve ark., 2011).. Esansiyel yağların antifungal etki mekanizmaları arasında hücre zarı bütünlüğünün bozulması, hücre içi pH'nın değişmesi ve ATP üretiminin engellenmesi yer almaktadır (Prakash ve ark., 2012). Bununla birlikte, esansiyel yağların etkinliği hedef patojene göre değişiklik gösterebilmektedir (Kishore ve ark., 2007). Sonuç olarak, esansiyel yağlar, sentetik fungisitlere alternatif olarak sürdürülebilir tarım uygulamalarında kullanılabilecek doğal antifungal ajanlar olarak öne çıkmaktadır.

Uçucu yağlar farklı fitopatojen mikroorganizmalar üzerine gelişimi engelleyici etkiye sahiptir. Çok sayıda çalışma bitki hastalıklarının kontrolünde kimyasal ilaçlara göre çevre dostu organik kaynaklar olmalarından dolayı uçucu yağların kullanımına odaklanmıştır. Öğrek otu da güçlü antifungal etkiye sahip bitkisel kaynaklardan biridir. Başka bir çalışmada, Türkiye'de yetişen *H. platytaenium* Boiss. türünün havai kısımlarından (gövde, yaprak, çiçek ve meyve gibi toprak üstünde bulunan bölümleri) elde edilen uçucu yağın bileşimi GC-MS yöntemiyle belirlenmiştir. Uçucu yağın %95,24'ünü oluşturan 22 bileşen tespit edilmiştir. Yağın ana bileşenleri oktil asetat (%85,53), oktil hekzanoat (%3,06), (Z)-4-oktenil asetat (%1,60) ve oktil oktanoat (%1,24) olarak bulunmuştur. Bu çalışmada, ayrıca, *H. platytaenium* uçucu yağının çeşitli maya ve bakteri türlerine karşı antimikrobiyal aktivitesi disk difüzyon yöntemi kullanılarak araştırılmıştır. Ekstrakt, *Candida glabrata* üzerinde 12-32 mm arasında değişen inhibisyon zonları ile güçlü bir antimikrobiyal aktivite göstermiştir. Buna karşın, test edilen tüm bakterilerin büyümesi ekstrakttan etkilenmemiştir. Sonuç olarak, bu çalışma *H. platytaenium* uçucu yağının doğal bir antikandidal kaynak olarak değerlendirilebileceğini göstermektedir (Akcin ve ark., 2013).

Başka bir çalışmada *H. platytaenium* uçucu yağının çeşitli bitki patojenleri üzerindeki antifungal etkileri araştırılmıştır. Yapılan bileşen analizi sonucunda, uçucu yağın 12 farklı bileşen içerdiği belirlenmiş olup, ana bileşenler myristicin (%27.47) ve octyl acetate (%25.10) olarak tespit edilmiştir. Deneyler sonucunda, 10 µl uçucu yağın *Fusarium oxysporum*, *Rhizoctonia solani* ve *Sclerotinia sclerotiorum* türlerinin büyümesini tamamen inhibe ettiği görülmüştür. Çeşitli patojenler için etkili konsantrasyon (LC90) değerleri belirlenmiştir. Çalışmada, bu yağın bitki hastalıklarıyla mücadelede doğal bir alternatif olarak kullanılma potansiyeline sahip olduğu gösterilmiştir (Bayan ve ark., 2016).
Bu çalışmada, öğrek otu uçucu yağının *Alternaria alternata*'ya karşı antifungal etkisi, ekstraksiyon yılına bağlı olarak değerlendirilmiştir. Tablo 1'de sunulan verilere göre, uçucu yağın farklı konsantrasyonları fungusun miseliyal gelişimini baskılamış ve artan dozlarla birlikte inhibisyon oranlarında belirgin bir artış gözlenmiştir.
Özellikle 20 µL dozu, her iki ekstraksiyon yılında da en yüksek inhibisyon oranlarını sağlamış olup, 2022 yılına ait uçucu yağ %76,6 - %75,5 oranlarında inhibisyon gösterirken, 2021 yılına ait yağ %77,7 - %86,6 arasında değişen oranlarda antifungal etki sergilemiştir. Bu durum, uçucu yağın biyolojik aktivitesinin ekstraksiyon yılına bağlı olarak değişebileceğini ve farklı yıllarda elde edilen örneklerde bileşen miktarlarının farklılık gösterebileceğini düşündürmektedir. Literatürde bu uçucu yağ üzerine yapılmış neredeyse hiçbir çalışma bulunmadığından, bu çalışmamızın özgün ve güncel olduğunu göstermektedir.
Daha düşük konsantrasyonlarda (5 µL ve 10 µL) ise inhibisyon etkisinin belirgin olduğu ancak maksimum düzeye ulaşmadığı görülmüştür. 5 µL dozunda %27,7 - %35,5, 10 µL dozunda ise %31,1 - %62,2 arasında değişen inhibisyon değerleri kaydedilmiştir. Bu bulgular, doz bağımlı bir antifungal etkinin varlığını ortaya koymakta ve özellikle yüksek konsantrasyonlarda uçucu yağın güçlü bir biyofungisit olabileceğini desteklemektedir. Çalışma kapsamında elde edilen veriler Tablo 1 ve Tablo 2'de sunulmuştur.
Türün farklı yıllarda ve dozlarda uygulanan uçucu yağı ile dozxyıl interaksiyonu *A. alternata*'ya karşı antifungal etkisi istatiksel olarak ($p<0.01$) önemli bulunmuştur (Tablo 1).

Tablo 1. Ekstraksiyon yılına bağlı olarak elde edilen *H. platytaenium* uçucu yağının antifungal aktivitesine ait varyans analiz sonuçları

Varyasyon kaynakları	Serbestlik derecesi	Kareler toplamı	Kareler ortalaması	F değeri
Yıl	1	202.8	202.8	30.88**
Doz	4	25647.2	6411.8	976.42**
Yıl x Doz	4	460.53	115.13	17.53**
Hata	20	131.3	6.67	
Genel	29			
Cv	5.1			

H. platytaenium türünün 2021 yılı meyvelerinden elde edilen uçucu yağı 47.5 mm inhibisyon çapına sahip olurken 2022 yılında elde edilen yağı 52.7 mm çapa sahip olmuştur. Farklı dozlarda uygulanan *H. platytaenium* uçucu yağında en düşük antifungal etki 5 µL uygulamasında 69.7 mm olurken doz artışına bağlı olarak antifungal etki artarak 20 µL uygulamasında 29.3 mm olarak belirlenmiştir.

Tablo 2. Ekstraksiyon yılına bağlı olarak elde edilen *H. platytaenium* uçucu yağının antifungal aktivitesini gösteren miseliyal ölçümler

	Negatif Kontrol	**Pozitif Kontrol**	**5 µL**	**10 µL**	**20 µL**	**Ortalama**
2021	90 a	8.0 f	68.7 b	44.7 d	26.0 e	47.5 B
2022	90 a	8.0 f	70.1 bc	65.3 c	29.3 e	52.7 A
Ortalama	90 A	8 E	69.7 C	55.0 C	27.7 D	
$Lsd_{yıl}$:1.95	Lsd_{doz}: 3.09	$Lsd_{yılxdoz}$: 4.58				

Ek olarak, farklı ekstraksiyon yıllarına ait uçucu yağlar karşılaştırıldığında, 2021 yılına ait örneklerin inhibisyon etkisinin genel olarak daha yüksek olduğu gözlenmiştir. Bu farklılık, uçucu yağın kimyasal bileşiminin çevresel faktörlerden, hasat zamanından veya depolama koşullarından etkilenebileceğini göstermektedir. Uçucu yağın ana bileşenleri arasında bulunan n-oktil asetat, apiyol ve elemisin gibi fitokimyasal bileşiklerin antifungal etkiye katkıda bulunabileceği düşünülmektedir (Kılıç ve ark., 2016; Karan ve Genc, 2018).

Sonuç olarak, *H. platytaenium* uçucu yağı, *A. alternata*'nın misel gelişimini baskılayarak bitki hastalıklarıyla biyolojik mücadelede alternatif bir antifungal ajan olarak değerlendirilebilir. Ancak, bileşen profili ve etkinliği üzerinde ekstraksiyon yılı, çevresel faktörler ve doz gibi değişkenlerin etkili olduğu görülmektedir. Gelecekteki çalışmalar, bu faktörlerin uçucu yağın antifungal aktivitesi üzerindeki etkilerini daha detaylı incelemeli ve farklı patojen türleri ile genişletilmelidir.

Abstract

This study evaluates the in vitro antifungal potential of Heracleum platytaenium essential oil against Sclerotinia sclerotiorum, a widespread phytopathogenic fungus that causes significant economic losses in agricultural production. Although chemical fungicides are commonly used for its control, concerns regarding environmental impact and human health have increased interest in plant-based antifungal agents as sustainable alternatives.
In this study, commercially obtained *H. platytaenium* essential oil was tested at three different concentrations (5 µL, 10 µL, and 20 µL) to assess its inhibitory effects on fungal mycelial growth. The experiments were conducted with negative control (fungus growing without treatment) and positive control (nistatin application). The results demonstrated that higher concentrations of the essential oil significantly suppressed fungal growth. Particularly, at 20 µL concentration, both extraction years exhibited strong antifungal activity, with inhibition rates ranging from 97.7% to 100%. Additionally, at lower doses (5 µL), the 2021 extract showed higher antifungal efficacy compared to the 2022 extract.
These findings highlight the potential of H. platytaenium essential oil as a natural antifungal agent for plant disease management. The differences in antifungal activity observed between extraction years suggest that factors such as plant growth conditions, harvest time, and extraction methods may influence the oil's efficacy. Further studies are needed to explore its chemical composition, antifungal mechanisms, and potential applications in agricultural practices.

Key Words: *Heracleum platytaenium, Essential oil, Antifungal activity, Sclerotinia sclerotiorum*

Heracleum Platytaenium Boiss. (Endemik) Uçucu Yağı Beyaz Çürüklük Hastalığına Karşı Biyopestisit Olarak Kullanılabilir mi?

Özet

Çalışmada, *Heracleum platytaenium* uçucu yağının *Sclerotinia sclerotiorum* fitopatojeni üzerine in vitro antifungal etkilerinin belirlenmesi amacı ile yürütülmüştür. S. *sclerotiorum,* tarımsal üretimde ciddi ekonomik kayıplara yol açan yaygın bir fitopatojen fungus olup, genellikle kimyasal fungisitlerle kontrol altına alınmaktadır. Ancak, çevresel etkiler ve insan sağlığı üzerindeki olumsuz etkiler nedeniyle bitkisel bazlı antifungal ajanlar sürdürülebilir alternatifler olarak öne çıkmaktadır.
Çalışma, negatif kontrol (fungus gelişimi için herhangi bir uygulama yapılmayan ortam) ve pozitif kontrol (nistatin uygulaması) ve *H. platytaenium* uçucu yağı 5 µL, 10 µL ve 20 µL olmak üzere üç farklı konsantrasyonda test edilerek, fungusun miseliyal büyümesi üzerindeki etkileri incelenmiştir. Sonuçlar, yağın daha yüksek konsantrasyonlarının fungus gelişimini önemli ölçüde baskıladığını ortaya koymuştur
H. platytaenium uçucu yağının bitki hastalıklarıyla mücadelede doğal bir antifungal ajan olarak kullanılma potansiyeline sahip olduğunu göstermektedir. Gelecekte yapılacak çalışmalar, yağın kimyasal bileşimi, antifungal mekanizmaları ve tarımsal uygulamalardaki potansiyel kullanımını daha ayrıntılı şekilde ortaya koyacaktır.

Anahtar Kelimeler: *Heracleum platytaenium, Esansiyel yağ, Antifungal aktivite, Sclerotinia sclerotiorum*

Giriş

Sclerotinia sclerotiorum, dünya genelinde yaygın olarak görülen ve tarımsal üretime ciddi zararlar veren önemli bir fitopatojenik fungustur. Ilıman ve nemli iklim bölgelerinde sıklıkla rastlanan bu fungus, hava, su, tarım aletleri, hayvanlar ve enfekte tohumlar aracılığıyla yayılabilir (Purdy, 1979; Bolton ve ark., 2006). Enfeksiyon oluşturma

yeteneği oldukça yüksek olan ve özellikle toprakta uzun süre canlı kalabilen sklerotları sayesinde yıllarca enfeksiyon kaynağı olabilmektedir (Bolton ve ark., 2006). Bu durum, hastalığın kontrol altına alınmasını zorlaştıran en önemli faktörlerden biridir.

Bu patojen, geniş bir konukçu dizisine sahip olup yaklaşık 400'den fazla bitki türünü enfekte edebilmektedir (Purdy, 1979). Tarımsal açıdan önemli bitkiler arasında soya fasulyesi (*Glycine max*), bezelye (*Pisum sativum*), domates (*Solanum lycopersicum*), biber (*Capsicum annuum*), havuç (*Daucus carota*), marul (*Lactuca sativa*), kanola (*Brassica napus*), ayçiçeği (*Helianthus annuus*) ve pamuk (*Gossypium hirsutum*) gibi bitkiler yer almaktadır (Boland ve Hall, 1994; Kim ve ark., 2006; Westrick ve ark., 2019). Bu kadar geniş bir konukçu yelpazesine sahip olması, fungusun ekili alanlarda hızla yayılmasına ve verim kayıplarına neden olmasına yol açmaktadır. Özellikle serin ve nemli hava koşullarında hastalığın şiddeti artmakta, bazı durumlarda %80'e varan ürün kayıplarına sebep olabilmektedir (Amselem ve ark., 2011). Hastalık, sadece verim düşüşüne değil, aynı zamanda meyve ve tohumların çürümesi nedeniyle kalite kaybına ve pazarlanabilirliğin azalmasına da neden olmaktadır (Xu ve ark., 2018). Bunun yanı sıra, depolama sırasında da çürümeye yol açarak ekonomik kayıpları daha da artırmaktadır.

S. sclerotiorum, yaşam döngüsünde sklerot, miselyum ve askospor oluşumuna dayalı bir süreç izler. Fungus, enfekte olmuş bitki dokularında sklerot adı verilen sert ve koyu renkli yapılar oluşturur. Bu sklerotlar, uzun süre toprakta dayanıklı kalarak uygun koşullar oluştuğunda çimlenir ve yeni enfeksiyonlara yol açar (Willetts & Wong, 1980). Çimlenme sonucunda apothecium adı verilen küçük fungal yapılar gelişir ve bu yapılar, askosporları üreterek hastalığın yayılmasını sağlar. Askosporlar hava yoluyla taşınarak bitkilerin yaprak, gövde ve çiçek yüzeylerine tutunur ve burada miselyum gelişimini başlatır (Kohn, 1979; Willbur ve ark., 2019). Fungus, bitki dokularına enzimler salgılayarak hücreleri parçalar ve hızla yayılır. İleri aşamalarda yeni sklerotlar oluşur ve hastalık döngüsü tekrar başlar (Peltier ve ark., 2012).

Enfeksiyonun bitkilerde oluşturduğu belirtiler oldukça belirgindir. Enfekte bitkilerde solgunluk, gövde çürüklüğü, yapraklarda nekroz, su kaybı ve yumuşak çürüklük gibi semptomlar görülür. Özellikle hastalığın ilerleyen evrelerinde, bitkinin enfekte olmuş dokularında pamuk benzeri beyaz miselyal tabaka ve siyah sklerotlar oluşur (Ekins ve ark., 2007; Silva ve ark., 2014; Lehner ve ark., 2016). Meyve ve çiçek enfeksiyonları da oldukça yaygındır ve bu durum, özellikle baklagiller ve yağ bitkileri gibi ürünlerde ciddi ekonomik kayıplara neden olabilir (Rodríguez ve ark., 2004; Zhao ve ark., 2004; Sabaté ve ark., 2018; Hossain ve ark., 2023).

S. sclerotiorum, kimyasal fungisitlerle kontrol altına alınabilse de, fungisit direncinin gelişmesi, çevresel kaygılar ve insan sağlığına yönelik riskler nedeniyle alternatif mücadele yöntemlerine ihtiyaç duyulmaktadır (Gossen ve ark., 2001). Bu nedenle, biyolojik kontrol stratejileri ve bitkisel bazlı antifungal ajanlar üzerine yapılan araştırmalar giderek önem kazanmaktadır. Son yıllarda, uçucu yağların antifungal özellikleri üzerine yapılan çalışmalar artmış ve bazı bitkilerin bu fungusa karşı doğal bileşikler üreterek etkili bir mücadele yöntemi sunabileceği gösterilmiştir (Soylu ve ark., 2007; Bakkali ve ark., 2008; Jiang ve ark., 2013; Türkmen ve Kaya, 2021). *H. platytaenium* gibi uçucu yağ içeriği zengin bitkilerin antimikrobiyal potansiyeli, özellikle çevre dostu ve sürdürülebilir mücadele stratejileri geliştirilmesi açısından büyük bir fırsat sunmaktadır (Iscan ve ark., 2004; Bahadori ve ark., 2016; Karan ve Genc, 2018).

Bu çalışmada, *H. platytaenium* uçucu yağının *S. sclerotiorum* üzerindeki antifungal etkisi araştırılarak, bitkisel bazlı doğal bileşiklerin patojenlerle mücadelede kullanılma potansiyeli değerlendirilecektir. Yapılacak analizlerle, farklı yıllarda ekstrakte edilen bu uçucu yağın fungusa karşı etkinliği belirlenecek ve alternatif biyolojik mücadele yöntemleri geliştirilmesine katkı sağlanacaktır.

Materyal ve Yöntem

Uçucu Yağ ve Test Fungusu

Çalışmada kullanılan *H. platytaenium* bitkisinin uçucu yağı Isparta Uygulamalı Bilimler Üniversitesi, Ziraat Fakültesi Deneme alanlarında yetiştirilmiştir. Türün 100 gr meyveleri öğütüldükten sonra 3 saat boyunca hidrodistilasyona tabi tutulmuştur. Araştırmada test edilen *Sclerotinia sclerotiorum*, Bingöl Üniversitesi Ziraat Fakültesi Fitopatoloji Laboratuvarı'nda bulunan fungus koleksiyonundan elde edilmiştir.

Besiyeri Hazırlığı

Fungal izolatın saflaştırılması ve çoğaltılması amacıyla Patates Dekstroz Agar (PDA) besiyeri hazırlanmış ve distile su ile desteklenmiştir. Besiyeri, 121.1°C'de 15 dakika boyunca otoklavda sterilize edildikten sonra aseptik koşullarda steril petri kaplarına dökülmüştür. Hazırlanan besiyeri, hem ön kültür elde edilmesi hem de uygulama gruplarının oluşturulması için kullanılmıştır. Uygulama gruplarında, uçucu yağın farklı konsantrasyonları (5 µl, 10 µl, 20 µl) besiyerine eklenmiştir.

Fungal İzolatın Hazırlanması

Fungal izolatlar, 90 mm çapındaki petri kaplarına aktarılan besiyeri üzerine yerleştirilmiş ve optimum sıcaklık ve nem koşullarında 7 gün boyunca inkübe edilmiştir.

Antifungal Aktivite Testi

İnokülasyona hazır hale getirilen *S. sclerotiorum* kültürlerinden 8 mm çapındaki miselyal diskler steril bir fungus delici yardımıyla kesilerek PDA ortamının merkezine inoküle edilmiştir. Fungusun gelişimi tamamlanana kadar petri kapları uygun inkübasyon koşullarında muhafaza edilmiştir. Denemeler üç tekerrürlü olarak yürütülmüştür.

Çalışmada, antifungal etkiyi değerlendirmek için pozitif kontrol (nistatin) ve negatif kontrol (uçucu yağ içermeyen ortam) grupları kullanılmıştır.

İnkübasyon süresi sonunda fungal koloni çapları ölçülmüş ve elde edilen veriler doğrultusunda antifungal etkinlik belirlenmiştir (Benjilali ve ark., 1984). Antifungal etki, Deans ve Svoboda (1990) tarafından önerilen şu formüle göre hesaplanmıştır:

İnhibisyon (%) = [(gc - gt) / gc] × 100

(gc: kontrol gruplarındaki miselyal büyüme çapı, gt: uçucu yağ uygulanmış ortamdaki miselyal büyüme çapı).

İstatistiki Analiz

Farklı yıllar ve dozlardan elde edilen veriler tesadüf parselleri deneme deseninde 3 tekrarlı olarak faktöriyel düzenlemeye göre SAS (2009) istatistik paket programında GLM prosedürü kullanılarak standart varyans analizi tekniğinde (ANOVA) analiz edilmiş ve ortalamalar arasındaki farklılıklar LSD çoklu karşılaştırma testine göre belirlenmiştir.

Bulgular ve Tartışma

Esansiyel yağlar, tarımda doğal antifungal ajanlar olarak yaygın bir şekilde kullanılmaktadır. Sentetik fungisitlerin uzun vadeli kullanımı, hem çevresel hem de insan sağlığına zararları nedeniyle alternatif biyolojik kontrol yöntemlerine olan ihtiyacı artırmıştır. Çeşitli bitkisel bazlı esansiyel yağların antifungal özellikleri, in vitro ve in vivo çalışmalarda kanıtlanmıştır (Bakkali ve ark., 2008; Soylu ve ark., 2007).

S. sclerotiorum'un kontrolüne yönelik in vitro çalışmalarda, esansiyel yağların antifungal etkinliğini değerlendirmek için çoğunlukla miselyal büyümeyi inhibe etme yöntemi kullanılmaktadır. Örneğin, *Origanum syriacum* ve *Foeniculum vulgare* esansiyel yağlarının *S. sclerotiorum* miselyal gelişimi üzerine baskılayıcı etkisi belirlenmiştir (Soylu ve ark., 2007). Bir çalışmada, *Ziziphora clinopodioides* Lam. esansiyel yağının (ZCEO) *S. sclerotiorum*'a karşı in vitro ve in vivo etkilerini araştırmıştır. GC-MS analizi, yağın %98,3'ünü oluşturan 21 bileşiği tespit etmiştir; en yüksek bileşikler pulegon (%53,5), izomenton (%10,4) ve karvondur (%5,7). ZCEO, *S. sclerotiorum*'un misel büyümesini, 1,25 µl ml−1 (temas fazı) ve 0,15 µl ml−1 (buhar fazı) konsantrasyonlarında tamamen inhibe etmiştir. Sklerotların çimlenmesi de bu konsantrasyonlarla engellenmiştir. ZCEO, rapsi bitkilerinde (*Brassica napus*) de *S. sclerotiorum*'un büyümesini doz bağımlı olarak inhibe etmiş, fungusun morfolojisinde değişiklikler gözlemlenmiştir. Sonuçlar, ZCEO'nun etkili bir koruma aracı olabileceğini göstermektedir (Ma ve ark., 2016). Başka bir çalışmada, *Piper aduncum* bitkisinin yaprak ve çiçekli dallarından elde edilen esansiyel yağların, *S. sclerotiorum* fungusunun misel büyümesi üzerindeki etkisi incelenmiştir. Esansiyel yağlar, hidrodistilasyon ile elde edilip GC-MS ve GC-FID ile analiz edilmiştir. *P. aduncum* yağlarında bulunan başlıca bileşikler arasında piperiton (%23,4), miristikin (%12,4), terpin-4-ol (%12,3), β-karyofilen (%7,2), α-humulen (%6,9), germakren-D (%6,9) ve dillapiol (%6,3) yer aldığı tespit edilmiştir. In vitro testler, bu esansiyel yağının 30 µL dozda etmenin misel büyümesini %100'e yakın oranda inhibe ettiğini göstermiştir. Sonuçlar, bu esansiyel yağların *S. sclerotiorum* üzerinde yüksek potansiyele sahip olduğunu ortaya koymuştur (Valadares ve ark., 2018). Elgorbany ve ark. (2015), soğan (*Allium cepa*), çörek otu (*Nigella sativa*) ve okaliptüs (*Eucalyptus globulus*) esansiyel yağlarının beş farklı fitopatojen fungusa (*Fusarium oxysporum f.sp. melonis*, *F. solani*, *F. verticillioides*, *S. sclerotiorum* ve *R. solani*) karşı antifungal etkilerini değerlendirilmiştir. Soğan ve okaliptüs esansiyel yağları, 500 ppm konsantrasyonda bazı fungus türlerinin miseliyal büyümesini tamamen inhibe etmiştir. Çörek otu yağı ise farklı patojenlere karşı değişen oranlarda antifungal aktivite göstermiştir. Soğan esansiyel yağı, *F. oxysporum f.sp. melonis* ve *F. solani*'nin spor çimlenmesini tamamen engellerken, okaliptüs yağı *F. oxysporum f. sp. melonis* ve *F. verticillioides* üzerinde yüksek oranda inhibisyon sağlamıştır. Sonuçlar, özellikle soğan ve okaliptüs esansiyel yağlarının biyofungisit olarak kullanılabileceğini göstermiştir.

Heracleum cinsine ait farklı bitkilerden elde edilen uçucu yağlar ve ekstraktlar üzerine çeşitli çalışmalar yapılmış olsa da, bu çalışmada kullanılan *H. platytaenium* bitkisinin antifungal aktivitesine ilişkin araştırmalar oldukça sınırlıdır. Ancak, Heracleum türlerinin esansiyel yağlarının antimikrobiyal ve antifungal özelliklerini inceleyen önceki çalışmalar, bu yağların çeşitli patojen mikroorganizmalara karşı etkili olduğunu ortaya koymuştur (Torbati ve ark., 2013). Esansiyel yağların bitki patojenleri üzerinde doğrudan temas veya volatil bileşenler aracılığıyla baskılayıcı etki gösterebildiği de bilinmektedir (Jiang ve ark., 2013). Örneğin, *H. platytaenium* esansiyel yağının gıda kontaminantı olan *Penicillium verrucosum*'un büyümesini engellediği gösterilmiştir (Özçakmak, 2012).

Bu çalışmada, farklı yıllarda elde edilen öğrek otu (*H. platytaenium*) esansiyel yağının, *S. sclerotiorum* etmenine karşı antifungal aktivitesi üç farklı doz kullanılarak değerlendirilmiştir. Üç tekerrürlü olarak gerçekleştirilen testler, artan konsantrasyonların miseliyal gelişimi baskıladığını doğrulamıştır. Bu bulgular, mevcut çalışmanın kendi alanında yürütülen diğer benzer çalışmaların sonuçlarıyla parallelik göstermektedir. Türkiye'de gerçekleştirilen bir araştırmada, *H. platytaenium* esansiyel yağının *Fusarium oxysporum*, *Rhizoctonia solani* ve *Sclerotinia sclerotiorum* gibi fitopatojenlere karşı güçlü antifungal aktivite sergilediği tespit edilmiştir (Bayan ve ark., 2016). Bu çalışmada, ekstraksiyon yılına bağlı olarak gerçekleştirilen miseliyal ölçümler ve yüzde inhibisyon değerleri aşağıdaki tablolarda detaylandırılmıştır.

Farklı yıllarda hasat edilen, farklı dozlarda uygulanan ve yıllara bağlı olarak *H. platytaenium* uçucu yağının dozlarının göstermiş olduğu antifungal istatiksel olarak ($p<0.01$) önemli bulunmuştur.

Tablo 1. Ekstraksiyon yılına bağlı olarak elde edilen *H. platytaenium* uçucu yağının antifungal aktivitesine ait varyans analiz sonuçları

Varyasyon kaynakları	Serbestlik derecesi	Kareler toplamı	Kareler ortalaması	F değeri
Yıl	1	45.6333	45.63	33.39**
Doz	4	36617.2	6698.24	6698.27**
Yıl x Doz	4	127.2	23.27	23.27**

Cv	2.61			

Yıllara bağlı olarak en düşük inhibisyona çapı 2022 yılında 43.53 mm olurken 2021 yılında 46.0 mm olarak ölçülmüştür. Dozlara bağlı olarak en düşük inhibisyon çapı istatiksel olarak aynı grup içerisinde yer 20 µL (8.7 mm) ve pozitif kontrol grubunda (8.0 mm) belirlenirken en yüksek inhibiyon çapı negatif kontrol grubunda (90.0) olarak belirlenmiştir. 2021 ve 2022 yıllarında bağlı olarak uygulama dozları en düşük inhibisyon çapı istatiksel olarak aynı grup içerisinde yere alan pozitif kontrol ve 20 µL uygularında tespit edilirken uygulamalara arasında en yüksek inhibisyon çapı 5 µL dozunda tespit edilmiştir.

Tablo 2. Ekstraksiyon yılına bağlı olarak elde edilen *H. platytaenium* uçucu yağının antifungal aktivitesini gösteren miseliyal ölçümleri mm

	Negatif Kontrol	Pozitif Kontrol	5 µL	10 µL	20 µL	Ortalama
2021	90 a	8.0 e	81.7 b	41.3 c	9.0 e	46.0 A
2022	90 a	8.0 e	80.7 b	30.7 d	8.3 e	43.53 B
Ortalama	90 A	8.0 D	81.2 B	36.0 C	8.7 D	
$Lsd_{yıl}$:0.89	Lsd_{doz}: 1.41	$Lsd_{yılxdoz}$: 2.01				

Tablo 2'e göre, negatif kontrol grubunda fungus gelişimi devam etmiş ve büyüme oranı %90 olarak belirlenmiştir. Pozitif kontrol grubunda ise standart antifungal ajan kullanılmış ve fungusun gelişimi tamamen inhibe edilerek %100 inhibisyon sağlanmıştır. Deney gruplarında farklı dozlarda (5 µL, 10 µL, 20 µL) uçucu yağ uygulanarak inhibisyon oranları karşılaştırılmıştır. 5 µL dozunda, 2022 yılı ekstraktının inhibisyon oranı %17,7 ile %20 arasında değişirken, 2021 yılı ekstraktı %14,4 ile %42,2 arasında değişen bir inhibisyon göstermiştir. Bu dozda, 2021 yılı ekstraktı bazı tekrarlar için daha yüksek antifungal aktivite göstermiştir. 10 µL dozunda, 2022 yılı ekstraktı %73,3 ile %75,5 arasında değişen bir inhibisyon sağlarken, 2021 yılı ekstraktı %62,2 ile %64,4 arasında inhibisyon göstermiştir. Bu seviyede, 2022 yılı ekstraktı daha güçlü bir antifungal etki sergilemiştir. 20 µL dozunda, 2022 yılı ekstraktı %98,8 ile %100 arasında değişen bir inhibisyon oranına ulaşırken, 2021 yılı ekstraktı %97,7 ile %100 arasında inhibisyon sağlamıştır. Yüksek dozda her iki yılın ekstraktı da neredeyse eşit düzeyde ve oldukça güçlü bir antifungal etki göstermiştir.

Sonuçlar, *H. platytaenium* uçucu yağının doz bağımlı bir antifungal etkiye sahip olduğunu ve özellikle yüksek dozlarda fungus gelişimini büyük ölçüde baskıladığını göstermektedir. Farklı yıllarda elde edilen ekstraktlar arasında belirli oranlarda farklılıklar gözlemlense de, genel olarak güçlü antifungal aktivite sergiledikleri belirlenmiştir. Bu çalışmanın bulguları, daha önce yapılan benzer çalışmalarla karşılaştırıldığında önemli benzerlikler ve farklılıklar gözlemlenmiştir. Soylu ve ark. (2007) kekik ve rezene esansiyel yağlarının *S. sclerotiorum* miselyal gelişimini %80'den fazla inhibe ettiğini bildirmiştir. Benzer şekilde, Jiang ve ark. (2013) tarçın yağının bu fungusa karşı yüksek antifungal etki gösterdiğini ortaya koymuştur. Bizim çalışmamızda da benzer inhibisyon düzeyleri kaydedilmiş olup, 20 µL dozundaki tam inhibisyon sonucu diğer çalışmalarla uyumluluk göstermektedir.

H. platytaenium esansiyel yağına dair önceki araştırmalarda, miristisin (%27.47), oktil asetat (%25.10) ve 1-oktanol (%16.90) bileşenlerinin öne çıktığı ve antifungal etkinliği desteklediği bildirilmiştir (Bayan ve ark., 2016). Kılıç ve Dirmenci (2016)'in analizleri öğrek otu esansiyel yağının %95,24'ünü oluşturan 22 bileşen tespit etmiştir. Başlıca bileşenler, oktil asetat (%85,53), oktil hekzanoat (%3,06), (Z)-4-oktenil asetat (%1,60) ve oktil oktanoat (%1,24) olarak belirlenmiştir. Esansiyel yağların antimikrobiyal etkisi, bileşenlerinin kalite ve miktarına bağlıdır. Bu bileşenler ise bitkinin yetiştiği çevresel koşullar ve ekstraksiyon yöntemleri gibi faktörlerden etkilenmektedir (Reyes-Jurado ve ark., 2015; Kakaraparthi ve ark., 2014; Bahadori ve ark., 2016; Mechergui ve ark., 2016). Çalışmada, farklı yıllarda ekstrakte edilen yağlar arasındaki aktivite farklılığı dikkat çekicidir. Özellikle 5 µL dozundaki antifungal etki, 2021 ekstraktında 2022'ye göre belirgin olarak yüksekken, diğer testlerde 2022 yılında ekstrakte edilen esansiyel daha fazla antifungal aktivite sergilemiştir. 2021 yılında ekstrakte edilen yağın 5 µL dozunda daha etkili olması, belirli bir aktif bileşenin (örneğin, fenolik bileşikler veya monoterpenler gibi) düşük

dozlarda daha konsantre halde bulunmasından kaynaklanabilir. Ancak, daha yüksek dozlarda bu bileşenlerin etkileşimi veya diğer bileşiklerin baskın hale gelmesi, 2022 ekstraktını daha güçlü kılabilir.
Sonuç olarak, *H. platytaenium* esansiyel yağının *S. sclerotiorum* üzerindeki antifungal etkinliği kanıtlanmış olup, doğru doz ve ekstraksiyon koşulları optimize edilerek biyolojik mücadelede kullanılma potansiyeli araştırılmalıdır.

Abstract

The cosmetics sector is showing significant growth especially on skin aging. For this reason, it is known that studies on natural products that prevent aging and pigmentation are popular research areas. Antioxidants protect our skin from free radicals and help us prevent signs of aging and skin tone inequalities. High tyrosinase inhibition has a whitening effect on the skin, while collagenase inhibition has an anti-sagging effect on the skin. Antioxidant activity and tyrosinase/collagenase enzyme inhibition capacities support each other. This study aimed to determine the tyrosinase and collagenase enzyme inhibition potentials of ethanol extracts of *Consolida orientalis* flowers, whose antioxidant activity has been proven in the literature. In the study; kojic acid was used as the standard substance for anti-tyrosinase activity, and quercetin was used as the standard substance for anti-collagenase activity. According to the enzyme inhibitory capacity results measured with both analyses; anti-tyrosinase activity was determined as 13.0% and anti-collagenase activity as 23.2%. These results have shown us that the flowers of *C. orientalis* have the potential to inhibit tyrosinase and collagenase enzymes, although not at a high level. *C. orientalis* deserves further study and can be considered as a new candidate for the development of plant-based products for the management of hyperpigmentation and skin aging.

Key Words: *Collagenase, Consolida orientalis, Tyrosinase, Natural cosmetics*

Türkiye'den *Consolida orientalis*'in İn Vitro Tirozinaz ve Kollajenaz İnhibitör Potansiyeli

Özet

Kozmetik sektörü özellikle cilt yaşlanması üzerine ciddi bir büyüme göstermekte. Bu nedenle yaşlanma ve pigmentasyonu önleyen doğal kaynaklı ürünler üzerine yapılan çalışmaların popüler araştırma alanlarından olduğu bilinmektedir. Antioksidanlar cildimizi serbest radikallerden koruyarak yaşlılık belirtilerinin, cilt tonu eşitsizliklerinin önüne geçmemizde fayda sağlar. Yüksek tirozinaz inhibisyonu ciltte beyazlatma etkisi, kollajenaz inhibisyonu ise ciltte sarkma karşıtı etki göstermektedir. Antioksidan aktivite ve tirozinaz/kollajenaz enzim inhibisyon kapasiteleri birbirini destekleyen etkiler göstermektedir. Bu çalışma ile; antioksidan etkinliği literatürde kanıtlanmış olan *Consolida orientalis* çiçeklerinin etanol ekstrelerinin tirozinaz ve kollajenaz enzim inhibisyon potansiyellerini belirlemek amaçlanmıştır. Çalışmada; anti-tirozinaz aktivite için standart madde olarak kojik asit, anti-kollajenaz aktivite için standart madde olarak ise kersetin kullanılmıştır. Her iki analizle de ölçülen enzim inhibitör kapasite sonuçlarına göre; anti-tirozinaz aktivite %13.0, anti-kollajenaz aktivite %23.2 şeklinde belirlenmiştir. Bu sonuçlar bize; *C. orientalis* bitkisine ait çiçeklerin tirozinaz ve kollajenaz enzimini inhibe etme potansiyellerinin yüksek seviyede olmasa da varolduğunu göstermiştir. *C. orientalis* daha fazla çalışmayı hak eden, hiperpigmentasyon ve cilt yaşlanması yönetimine yönelik bitki kaynaklı ürün geliştirilmesi için yeni bir aday olarak değerlendirilebilir.

Anahtar kelimeler: *Kollajenaz, Consolida orientalis, Tirozinaz, Doğal kozmetikler*

Giriş

Consolida cinsi, Ranunculaceae familyasına ait, Batı Avrupa, Akdeniz ve Asya gibi dünyanın birçok yerinde doğal olarak yetişen yaklaşık 52 türden oluşan bir cinstir. *Consolida* cinsinin birçok üyesi, fenolikler ve alkaloitler gibi önemli fitokimyasallar içerir (Abbas Ali Dehpour, 2016; Rocchetti et al., 2020). Türkiye florası Ranunculaceae familyasından *Consolida* cinsine ait türler bakımından oldukça zengindir. 14 ü endemik olmak üzere 29 ayrı türün bulunduğu bilinmektedir (Ertuğrul, Arslan, & Tugay, 2010; Liu et al., 2018). *Consolida orientalis* orta-uzun boylu, yapışkan-tüylü tek yıllık bir bitki olup, 20-74 cm uzunluğunda basit veya dallı gövdeleri ve çok sayıda şeritsi-kılıç yaprakları bulunmaktadır. Çiçekler mor renkte ve yoğun salkım şeklindedir. Kurutulmuş ve taze kesme çiçek

bitkileri olarak kesme çiçek ticaretinde ve kuru bitki tasarımlarında sıkça tercih edilir (Mansuroglu, Karaguzel, & Ortacesme, 2009).

Consolida orientalis'in sahip olduğu biyolojik aktiviteden başlıca flavonoidler olmak üzere, fenolik asitler, tirozol türevleri, diterpen alkaloitler, lignanlar ve stilbenler sorumludur (Abbas Ali Dehpour, 2016; Rocchetti et al., 2020). Daha önce yapılan *in vivo* ve *in vitro* çalışmalar; antiparaziter, antifungal, antiviral, antikanser, antioksidan ve böcek öldürücü etkiler de dahil olmak üzere bir dizi biyolojik aktiviteye sahip olduğunu göstermiştir (A.A. Dehpour, Ebrahimzadeh, Roudgar, Nabavi, & Nabavi, 2011; Abbas Ali Dehpour, 2016; Nemati, Dehpouri, Eslami, Mahdavi, & Mirzanejad, 2013).

Hastalıkların meydana gelişi ve yaşlanma sürecini etkileyen en önemli olaylardan birinin oksidatif stres olduğu ile ilgili teoriler oldukça güçlüdür ve üzerinde çalışmalar devam etmektedir. Yaşam süresince oksidan ve antioksidan sistemler arasında denge durumunun bozulması oksidatif strese neden olur. Bu dengenin bozulması sonucunda da oksidatif hasar meydana gelir ve yaşlanmanın ana mekanizması incelendiğinde zamana bağlı oksidatif hasar birincil sebep olarak önemlidir. Organizmanın kendi mekanizmasında ürettiği doğal antioksidanlar yaş ile birlikte azalır. Bu sebeple bitkisel kaynaklı doğal antioksidanların dışardan alımı sistemdeki dengenin düzenlenmesine olanak sağlar (İlgün, Yıldırım, Karagül, & Şeker Karatoprak, 2024).

Bu şekilde enzimler ve enzim inhibitörleri özellikle tıp, gıda ve kozmetik endüstrisi, pestisit üretimi ve tarım endüstrisi olmak üzere birçok alanda kullanılmaktadır (Yan, Y. Jing, Zhixiang, & Suying, 2010). Tirozinaz enzimi, monofenollerin oksidasyonunu katalize eden bakır içeren bir enzimdir ve aynı zamanda melanin biyosentezinde rol oynar. Melanin pigmentini doğada birçok canlıda (hayvanlar, bitkiler, mantarlar, bakteriler) özellikle hayvanlarda bulmak mümkündür (Bilgin Sökmen & Yılmazoğlu, 2018). İnsanlarda melanin, hem serbest radikalleri absorbe etmede hem de organizmayı zararlı UV ışınlarından korumada çok önemli bir rol oynar (Zengin et al., 2019). Kalıtsal ve çevresel faktörlerin cilt rengi sorunlarının başlıca nedenleri arasında olduğu bilinmektedir. Bu dermatolojik olaylar arasında melazma, solar melanosis, ephelides, senil lentigolar ve akne izleri yer almaktadır (Trivedi, Yang, & Cho, 2017). Tirozinaz inhibitörleri cilt bakım sektöründe, özellikle lekeli ciltler için açıcı olarak sıklıkla kullanılmaktadır. Sentetik tirozinaz inhibitörleri içeren cilt ürünleri kızarıklık, kaşıntı ve gelecekte cilt kanseri gibi olumsuz etkilere sahiptir (Pillaiyar, Manickam, & Namasivayam, 2017). Tirozinaz inhibitörleri güçlü antioksidan aktiviteye sahiptir. Çünkü yüksek miktarda güneş ışığı alan bitkiler kendilerini güneşin zararlı ışınlarından korumak için oksijen radikallerini aktive eder. Bu nedenle bitkilerin kendilerini hasardan korumak için güçlü antioksidan etkilere sahip olması gerekir (Masuda, Yamashita, Takeda, & Yonemori, 2005). Sentetik moleküllerle ilgili sağlık endişeleri nedeniyle, hiperpigmentasyonun tedavisi için yeni bileşiklerin geliştirilmesinde doğal ürünlere olan ilgi yeniden canlanmıştır. Benzer biyolojik etkilere, enzim inaktivasyonuna ve antioksidan aktiviteye sahip yeni fitokimyasal bileşiklerin keşfi arzu edilir (Zengin et al., 2019).

Kolajenazlar, organ gelişimi ve doku rejenerasyonunun fizyolojik süreçlerinden sorumlu olan ve cilt yaşlanmasında doğrudan rol oynayan, ekstraselüler matris yeniden şekillenmesi ve bozulmasında yer alan proteolitik enzimlerdir. Kolajenazlar ayrıca hücre büyümesini ve sağ kalımını kontrol edebilen büyüme faktörleri gibi birçok matris ve matris dışı proteinin bozulmasında da yer alır (Freitas-Rodríguez, Folgueras, & López-Otín, 2017; Silva et al., 2024). Cilt yaşlanması, insan vücudunda kaçınılmaz bir biyolojik süreçtir ve yalnızca artan yaştan değil, aynı zamanda hem kronolojik hem de foto-yaşlanmadan da kaynaklanır. Foto-yaşlanma örnekleri arasında ultraviyole ışınlarına, kirliliğe veya nikotine maruz kalma yer alır. Bu yaşlanma sürecinde epidermis incelir ve kan damarları azalır. Bu hasarın elastik liflerin, kolajen liflerinin ve hyaluronik asidin bozulması ve üst dermal bağ dokusunda önemli dejeneratif değişiklikler sonucu meydana geldiği bilinmektedir. Bunun fibroblastlarda ve çeşitli inflamatuar hücrelerde üretilen elastaz, kolajenaz ve hyaluronidazın artan ekspresyonundan kaynaklandığı düşünülmektedir (Farage, Miller, Elsner, & Maibach, 2013; Lee, Cho, Park, & Choi, 2001).

Son yıllarda, bu bitkinin kozmetik ve farmasötik alanlarda potansiyel kullanımını değerlendirmek amacıyla yapılan in vitro çalışmalar artmıştır. Özellikle tirozinaz ve kollajenaz enzim inhibitör aktiviteleri, cilt hiperpigmentasyonu ve yaşlanma karşıtı tedavilerde önemli hedeflerdir. Çalışmamızın amacı, Türkiye'de yetişen *Consolida orientalis* bitkisine ait çiçeklerle hazırlanmış etanol ekstraktlarının tirozinaz ve kollajenaz enzim inhibisyon potansiyellerini belirlemektir.

Materyal ve Metod

Bitki Materyali

Çalışmada kullanılan *Consolida orientalis* bitkisi Haziran-Temmuz 2023 tarihleri arasında Sivas İmaret Köyü sınırları içerisinde, 1400 m yükseklikte, 39°41'40"K, 37°02'25"D koordinatlarındaki alandan toplanmıştır. Toplanan örneklerin taksonomik tanımlaması Anadolu Üniversitesi Eczacılık Fakültesi Öğretim Üyesi Prof. Dr. Yavuz Bülent KÖSE tarafından yapılmıştır. Toplanan bitkiye ait bir örneğe herbaryum numarası ESSE:16195 verilerek etiketlenmiş ve Anadolu Üniversitesi Eczacılık Fakültesi Herbaryumu'nda kayıt altına alınarak saklanmıştır.

Ekstraksiyon Hazırlanması

Çalışmamızda *Consolida orientalis*'in çiçek kısımlarından hazırlanan bitki özütleri kullanıldı. Örnekler önce musluk suyuyla, daha sonra olası kontaminasyonu önlemek için saf suyla yıkandı, daha sonra kurutma kağıtlarında kurutuldu, öğütücüde öğütüldü ve 100 gram alınarak üzerine 1000 ml etanol eklendi. 150 rpm'de bir çalkalayıcıda oda sıcaklığında 24 saat bekletildi. Ekstraksiyon işleminin sonunda özüt filtre kağıdından süzüldü ve daha sonra çözücü 40 °C'de döner buharlaştırıcıda uzaklaştırıldı. Elde edilen özütler koyu renkli cam şişeye konularak deneysel işlemlerde kullanılmak üzere -20 °C'de saklandı (Mata et al., 2007).

Anti-tirozinaz Aktivite

C. orientalis etanol ekstresinin (20 µg/mL) in *vitro* anti-tirozinaz aktivitesi, Hearing ve Jimenez'in (Hearing & Jiménez, 1987) tasarladığı metoda göre gerçekleştirilmiştir. İlk olarak, bileşiklerin difenolaz fonksiyonunu inhibe etme yeteneği değerlendirilmiştir ve substrat olarak L-DOPA kullanılmıştır. Mantar kaynaklı tirozinaz (E.C. 1.14.18.1) (30 U, 28 nM) Na-fosfat tamponunda (pH = 6.8, 50 nM) çözülmüş ve bileşikler çözeltinin içine eklenerek oda sıcaklığında on dakika boyunca ön inkübasyona bırakılmıştır. Enzimatik reaksiyonu başlatmak için, karışıma 0.5 mM L-DOPA eklenmiştir ve 37 °C'de 475 nm'de absorbans değişimi ölçülmüştür. Pozitif kontrol olarak kojik asit kullanılmıştır (Şahin et al., 2023).

Anti-kolajenaz Aktivite

C. orientalis etanol ekstresi (20 µg/mL) başlangıçta etanol ile çözüldü. Enzim inhibisyon deneyi, "Kollajenaz Aktivite Deney Kiti (Kolorimetrik, Abcam 196999)" üreticinin talimatlarına uygun olarak gerçekleştirilmiştir. Maddelerin enzim inhibisyonu kinetik modda 37°C'de çok modlu mikroplaka okuyucu (SpectraMax i3) ile 345 nm'de ölçülmüştür. Ekstrenin enzim inhibisyonu, kitte bulunan standartlarla karşılaştırılarak hesaplanmıştır. Numuneler için ortalama değer olarak % inhibisyon değeri hesaplanmıştır. Çalışmalar üç tekrarlı olarak yapılmıştır (Şahin et al., 2023).

Bulgular ve Tartışma

Anti-tirozinaz ve Anti-kollajenaz Aktivite

C. orientalis etanol ekstraktlarının tirozinaz ve kolajenaz enzim inhibisyon kapasiteleri araştırıldı. Elde edilen sonuçlara göre, *C. orientalis* etanol ekstraktı tirozinaz enziminde %13, kolajenaz enziminde ise %23,2 oranında inhibisyon gösterdi. Kojik asit ve kersetin sırasıyla anti-tirozinaz aktivitesi ve anti-kolajenaz aktivitesi için pozitif standartlar olarak kullanıldı. Tablo 1'de *C. orientalis* etanol ekstresinin anti-tirozinaz ve anti-kollajenaz aktivitesi sonuçları yer almaktadır.

Tablo 1. *C. orientalis* etanol ekstresinin anti-tirozinaz ve anti-kollajenaz aktivitesi.

	***C. orientalis* etanol ekstresi**	**Pozitif kontrol**
	% inhibisyon	
Anti-tirozinaz aktivite	13,0	98,9 (Kojik asit)
Anti-kollajenaz aktivite	23,2	91,4 (Kersetin)

C. orientalis etanol ekstresinin anti-tirozinaz aktivitesi incelendiğinde; düşük-orta seviyede tirozinaz enzimini inhibe ettiği sonucuna varılmıştır. *C. orientalis* etanol ekstresinin anti-kollajenaz aktivitesi, mevcut çalışmada ilk kez araştırılmıştır. Sonuçlar incelendiğinde ekstrenin düşük-orta seviyede kollajenaz enzimini inhibe ettiği görülmektedir.

Cilt yaşlanması kaçınılmaz süreci nedeniyle hepimizin en çok endişe duyduğu konulardan biridir. Günlük yaşamda, cildin güneşe maruz kalması, fotoyaşlanma adı verilen erken cilt yaşlanması görünümünü hızlandıran en önemli faktör olarak kabul edilir. Fotoyaşlanma, hücrelerdeki reaktif oksijen türleri (ROS) sentezinin dışsal mekanizmasını tetikleyebilir ve ROS'un aşırı üretimi, DNA'ya zararlı olan lipid peroksidasyonuna, ardından hücre hasarına ve hücre ölümüne neden olabilir (Jiratchayamaethasakul et al., 2020). Normalde vücutta bir denge vardır: ROS üretimi ile antioksidan savunma sistemi arasında. Bu denge bozulduğunda oksidatif stres ortaya çıkar. Bitkilerden elde edilen doğal antioksidanlar bu dengeyi yeniden kurmaya yardımcı olabilir. *Consolida orientalis* çiçek ekstrelerinin antioksidan aktivite açısından DPPH ve ABTS radikal temizleme testleri incelenmiş. Tüm ekstrelerin temizleme aktivitesi gösterdiği böylelikle bitkinin antioksidan aktivitesinin olduğu sonucuna varılmıştır (Sönmez Gürer, Karadağ, Baydar, & Demirel, 2024).

2019 yılında gerçekleştirilen bir çalışmada, *Consolida orientalis*'in metanol, etil asetat ve su ekstraktlarının tirozinaz inhibitör aktiviteleri değerlendirilmiştir. Sonuçlar, metanolik ekstraktın yüksek fenolik ve flavonoid içerikleriyle önemli derecede tirozinaz inhibitör aktivite gösterdiğini ortaya koymuştur. Bu etkinlik, epidermal hiperpigmentasyonun yönetiminde potansiyel bir tedavi seçeneği sunmaktadır (Zengin et al., 2019).

Consolida orientalis'in kollajenaz inhibitör aktivitesi üzerine doğrudan bir çalışma bulunmamakla birlikte, benzer bitkiler üzerinde yapılan araştırmalar, bu tür aktivitelerin varlığını göstermektedir. Örneğin, 2020 yılında yapılan bir çalışmada, çeşitli halofit bitkilerin elastaz, kollajenaz, hiyaluronidaz ve tirozinaz inhibitör aktiviteleri

incelenmiştir. Bu tür enzim inhibitör aktiviteleri, yaşlanma karşıtı ve cilt bakım ürünlerinin geliştirilmesinde önemli hedeflerdir (Jiratchayamaethasakul et al., 2020).

Tartışma ve Sonuç

Consolida orientalis bitkisi, özellikle metanolik ekstraktlarıyla tirozinaz inhibitör aktivite göstererek epidermal hiperpigmentasyonun yönetiminde potansiyel bir kaynak olarak değerlendirilebilir. Kollajenaz inhibitör aktiviteleri üzerine daha fazla araştırma yapılması, bu bitkinin yaşlanma karşıtı ve cilt bakım ürünlerinde kullanımını daha da destekleyecektir. Bu bağlamda, *Consolida orientalis*'in kozmetik ve farmasötik alanlarda kullanım potansiyelini değerlendiren daha kapsamlı in vitro ve in vivo çalışmalar önerilmektedir.

Kozmetik sektörü özellikle cilt yaşlanmasında önemli büyüme göstermektedir. Bu nedenle yaşlanmayı ve pigmentasyonu önleyen doğal ürünlerle ilgili çalışmaların popüler araştırma alanları olduğu bilinmektedir. Çalışmamızda; ciltte melanin pigmentinin farklılaşmasıyla oluşan dermatolojik hastalıklarda, nörolojik hastalıklarda ve anti-tirozinaz aktivite testi ile gıda/kozmetik sektöründe kullanılıp kullanılamayacağının tanımlanması; anti-kollajenaz aktivite testi ile kırışıklık ve cilt yaşlanması karşıtı hazırlanan topikal formülasyonların içeriğinde kullanılıp kullanılamayacağının belirlenmesi hedeflenmiştir. Sonuçlara göre *Consolida orientalis*'in düşük-orta seviyede anti-kollajenaz ve anti-tirozinaz aktivitesine sahip olduğu bulunmuştur. *C. orientalis*'in, hiperpigmentasyon ve cilt yaşlanmasının yönetimi için bitki kaynaklı ürünlerin geliştirilmesinde aday olarak kabul edilebilir ve bu konuda daha fazla çalışma yapılması gerekir. Bildiğimiz kadarıyla bu çalışma, *C. orientalis*'in anti-kolajenaz inhibitör etkilerini araştıran Türkiye'den ilk rapor olarak kabul edilebilir.

Bu sonuçlar bize; *C. orientalis* bitkisine ait çiçeklerin tirozinaz ve kollajenaz enzimini inhibe etme potansiyellerinin yüksek seviyede olmasa da varolduğunu göstermiştir. *C. orientalis* daha fazla çalışmayı hak eden, hiperpigmentasyon ve cilt yaşlanması yönetimine yönelik bitki kaynaklı ürün geliştirilmesi için yeni bir aday olarak değerlendirilebilir.

Teşekkür

Bitkinin teşhisini yapan Prof. Dr. Yavuz Bülent KÖSE'ye teşekkür ederiz.
